Chapter 12: Partial Differential Equations Support

Trigonometric Transform Routines.....	2893
Transforms Implemented.....	2894
Sequence of Invoking TT Routines.....	2895
Interface Description.....	2896
TT Routines.....	2897
?_init_trig_transform.....	2897
?_commit_trig_transform.....	2898
?_forward_trig_transform.....	2900
?_backward_trig_transform.....	2902
free_trig_transform.....	2904
Common Parameters.....	2905
Implementation Details.....	2908

Fast Poisson Solver Routines	2909
Poisson Solver Implementation.....	2910
Sequence of Invoking Poisson Solver Routines.....	2915
Interface Description.....	2917
Routines for the Cartesian Solver.....	2918
?_init_Helmholtz_2D/?_init_Helmholtz_3D.....	2918
_commit_Helmholtz_2D/?_commit_Helmholtz_3D.....	2920
?_Helmholtz_2D/?_Helmholtz_3D.....	2923
free_Helmholtz_2D/free_Helmholtz_3D.....	2926
Routines for the Spherical Solver.....	2927
?_init_sph_p/?_init_sph_np.....	2927
?_commit_sph_p/?_commit_sph_np.....	2929
?_sph_p/?_sph_np.....	2931
free_sph_p/free_sph_np.....	2933
Common Parameters.....	2934
ipar.....	2934
dpar and spar.....	2938
Caveat on Parameter Modifications.....	2940
Parameters That Define Boundary Conditions.....	2940
Implementation Details.....	2943
Calling PDE Support Routines from Fortran.....	2949

Chapter 13: Nonlinear Optimization Problem Solvers

Organization and Implementation.....	2951
Routine Naming Conventions.....	2952
Nonlinear Least Squares Problem without Constraints.....	2952
?trnlsp_init.....	2953
?trnlsp_check.....	2955
?trnlsp_solve.....	2956
?trnlsp_get.....	2958
?trnlsp_delete.....	2959
Nonlinear Least Squares Problem with Linear (Bound) Constraints.....	2960
?trnlspbc_init.....	2960
?trnlspbc_check.....	2962
?trnlspbc_solve.....	2965
?trnlspbc_get.....	2966
?trnlspbc_delete.....	2967
Jacobian Matrix Calculation Routines.....	2968
?jacobi_init.....	2968
?jacobi_solve.....	2969
?jacobi_delete.....	2970
?jacobi.....	2971
?jacobix.....	2972

Chapter 14: Support Functions

Using a Fortran Interface Module for Support Functions.....	2978
Version Information.....	2979
mkl_get_version_string.....	2979
Threading Control.....	2979
mkl_set_num_threads.....	2981

mkl_domain_set_num_threads.....	2981
mkl_set_num_threads_local.....	2982
mkl_set_dynamic.....	2984
mkl_get_max_threads.....	2985
mkl_domain_get_max_threads.....	2986
mkl_get_dynamic.....	2987
Error Handling.....	2988
Error Handling for Linear Algebra Routines.....	2988
xerbla.....	2988
pxerbla.....	2989
Handling Fatal Errors.....	2990
mkl_set_exit_handler.....	2990
Character Equality Testing.....	2991
lsame.....	2991
lsamen.....	2991
Timing.....	2992
second/dsecnd.....	2992
mkl_get_cpu_clocks.....	2993
mkl_get_cpu_frequency.....	2993
mkl_get_max_cpu_frequency.....	2994

Introducing the Intel® Math Kernel Library

The Intel® Math Kernel Library (Intel® MKL) improves performance with math routines for software applications that solve large computational problems. Intel MKL provides BLAS and LAPACK linear algebra routines, fast Fourier transforms, vectorized math functions, random number generation functions, and other functionality.

NOTE

It is your responsibility when using Intel MKL to ensure that input data has the required format and does not contain invalid characters. These can cause unexpected behavior of the library.

Intel MKL is optimized for the latest Intel processors, including processors with multiple cores (see the *Intel MKL Release Notes* for the full list of supported processors). Intel MKL also performs well on non-Intel processors.

For more details about functionality provided by Intel MKL, see the [Function Domains](#) section.

Optimization Notice
<p>Intel's compilers may or may not optimize to the same degree for non-Intel microprocessors for optimizations that are not unique to Intel microprocessors. These optimizations include SSE2, SSE3, and SSSE3 instruction sets and other optimizations. Intel does not guarantee the availability, functionality, or effectiveness of any optimization on microprocessors not manufactured by Intel. Microprocessor-dependent optimizations in this product are intended for use with Intel microprocessors. Certain optimizations not specific to Intel microarchitecture are reserved for Intel microprocessors. Please refer to the applicable product User and Reference Guides for more information regarding the specific instruction sets covered by this notice.</p> <p>Notice revision #20110804</p>

Getting Help and Support

Intel MKL provides a product web site that offers timely and comprehensive product information, including product features, white papers, and technical articles. For the latest information, check: <http://www.intel.com/software/products/support>.

Intel also provides a support web site that contains a rich repository of self help information, including getting started tips, known product issues, product errata, license information, user forums, and more (visit <http://www.intel.com/software/products/>).

Registering your product entitles you to one year of technical support and product updates through Intel® Premier Support. Intel Premier Support is an interactive issue management and communication web site providing these services:

- Submit issues and review their status.
- Download product updates anytime of the day.

To register your product, contact Intel, or seek product support, please visit <http://www.intel.com/software/products/support>.

What's New

This Reference Manual documents Intel® Math Kernel Library (Intel® MKL) 11.3 Update 2 release for the Fortran interface.

The following function domains were updated with new functions, enhancements to the existing functionality, or improvements to the existing documentation:

- The `mkl_finalize` function has been added to Support Functions to help avoid resource leaks when a third-party shared library is loaded and unloaded multiple times. See [mkl_finalize](#) for more details.
- The quality of math equations has been improved for some topics, including all [Fourier Transform](#) and [Partial Differential Equations Support](#) functions.
- Functionality has been added to [Summary Statistics](#) to sort the datasets by components of a random vector ξ .

The manual has also been updated to reflect other enhancements to the product, and minor improvements have been made.

Additionally, minor updates have been made to correct errors in the manual.

Optimization Notice
<p>Intel's compilers may or may not optimize to the same degree for non-Intel microprocessors for optimizations that are not unique to Intel microprocessors. These optimizations include SSE2, SSE3, and SSSE3 instruction sets and other optimizations. Intel does not guarantee the availability, functionality, or effectiveness of any optimization on microprocessors not manufactured by Intel. Microprocessor-dependent optimizations in this product are intended for use with Intel microprocessors. Certain optimizations not specific to Intel microarchitecture are reserved for Intel microprocessors. Please refer to the applicable product User and Reference Guides for more information regarding the specific instruction sets covered by this notice.</p> <p>Notice revision #20110804</p>

Notational Conventions

This manual uses the following terms to refer to operating systems:

Windows* OS	This term refers to information that is valid on all supported Windows* operating systems.
Linux* OS	This term refers to information that is valid on all supported Linux* operating systems.
OS X*	This term refers to information that is valid on Intel®-based systems running the OS X* operating system.

This manual uses the following notational conventions:

- Routine name shorthand (for example, `?ungqr` instead of `cungqr/zungqr`).
- Font conventions used for distinction between the text and the code.

Routine Name Shorthand

For shorthand, names that contain a question mark "?" represent groups of routines with similar functionality. Each group typically consists of routines used with four basic data types: single-precision real, double-precision real, single-precision complex, and double-precision complex. The question mark is used to indicate any or all possible varieties of a function; for example:

<code>?swap</code>	Refers to all four data types of the vector-vector <code>?swap</code> routine: <code>sswap</code> , <code>dswap</code> , <code>cswap</code> , and <code>zswap</code> .
--------------------	---

Font Conventions

The following font conventions are used:

<code>UPPERCASE COURIER</code>	Data type used in the description of input and output parameters for Fortran interface. For example, <code>CHARACTER*1</code> .
<code>lowercase courier</code>	Code examples: <code>a(k+i,j) = matrix(i,j)</code>
<i>lowercase courier italic</i>	Variables in arguments and parameters description. For example, <i>incx</i> .
*	Used as a multiplication symbol in code examples and equations and where required by the programming language syntax.

Function Domains

es

BLAS Routines

The BLAS routines and functions are divided into the following groups according to the operations they perform:

- [BLAS Level 1 Routines](#) perform operations of both addition and reduction on vectors of data. Typical operations include scaling and dot products.
- [BLAS Level 2 Routines](#) perform matrix-vector operations, such as matrix-vector multiplication, rank-1 and rank-2 matrix updates, and solution of triangular systems.
- [BLAS Level 3 Routines](#) perform matrix-matrix operations, such as matrix-matrix multiplication, rank-k update, and solution of triangular systems.

Starting from release 8.0, Intel® MKL also supports the Fortran 95 interface to the BLAS routines.

Starting from release 10.1, a number of [BLAS-like Extensions](#) are added to enable the user to perform certain data manipulation, including matrix in-place and out-of-place transposition operations combined with simple matrix arithmetic operations.

Sparse BLAS Routines

The [Sparse BLAS Level 1 Routines and Functions](#) and [Sparse BLAS Level 2 and Level 3 Routines](#) routines and functions operate on sparse vectors and matrices. These routines perform vector operations similar to the BLAS Level 1, 2, and 3 routines. The Sparse BLAS routines take advantage of vector and matrix sparsity: they allow you to store only non-zero elements of vectors and matrices. Intel MKL also supports Fortran 95 interface to Sparse BLAS routines.

LAPACK Routines

The Intel® Math Kernel Library fully supports LAPACK 3.5 set of computational, driver, auxiliary and utility routines.

The original versions of LAPACK from which that part of Intel MKL was derived can be obtained from <http://www.netlib.org/lapack/index.html>. The authors of LAPACK are E. Anderson, Z. Bai, C. Bischof, S. Blackford, J. Demmel, J. Dongarra, J. Du Croz, A. Greenbaum, S. Hammarling, A. McKenney, and D. Sorensen.

The LAPACK routines can be divided into the following groups according to the operations they perform:

- Routines for solving systems of linear equations, factoring and inverting matrices, and estimating condition numbers (see [LAPACK Routines: Linear Equations](#)).
- Routines for solving least squares problems, eigenvalue and singular value problems, and Sylvester's equations (see [LAPACK Routines: Least Squares and Eigenvalue Problems](#)).
- Auxiliary and utility routines used to perform certain subtasks, common low-level computation or related tasks (see [LAPACK Auxiliary Routines](#) and [LAPACK Utility Functions and Routines](#)).

Starting from release 8.0, Intel MKL also supports the Fortran 95 interface to LAPACK computational and driver routines. This interface provides an opportunity for simplified calls of LAPACK routines with fewer required arguments.

ScaLAPACK Routines

The ScaLAPACK package (provided only for Intel® 64 and Intel® Many Integrated Core architectures, see [Chapter 6](#) and [Chapter 7](#)) runs on distributed-memory architectures and includes routines for solving systems of linear equations, solving linear least squares problems, eigenvalue and singular value problems, as well as performing a number of related computational tasks.

The original versions of ScaLAPACK from which that part of Intel MKL was derived can be obtained from <http://www.netlib.org/scalapack/index.html>. The authors of ScaLAPACK are L. Blackford, J. Choi, A. Cleary, E. D'Azevedo, J. Demmel, I. Dhillon, J. Dongarra, S. Hammarling, G. Henry, A. Petitet, K. Stanley, D. Walker, and R. Whaley.

The Intel MKL version of ScaLAPACK is optimized for Intel® processors and uses MPICH version of MPI as well as Intel MPI.

PBLAS Routines

The PBLAS routines perform operations with distributed vectors and matrices.

- [PBLAS Level 1 Routines](#) perform operations of both addition and reduction on vectors of data. Typical operations include scaling and dot products.
- [PBLAS Level 2 Routines](#) perform distributed matrix-vector operations, such as matrix-vector multiplication, rank-1 and rank-2 matrix updates, and solution of triangular systems.
- [PBLAS Level 3 Routines](#) perform distributed matrix-matrix operations, such as matrix-matrix multiplication, rank- k update, and solution of triangular systems.

Intel MKL provides the PBLAS routines with interface similar to the interface used in the Netlib PBLAS (part of the ScaLAPACK package, see http://www.netlib.org/scalapack/html/pblas_qref.html).

Sparse Solver Routines

Direct sparse solver routines in Intel MKL (see [Chapter 8](#)) solve symmetric and symmetrically-structured sparse matrices with real or complex coefficients. For symmetric matrices, these Intel MKL subroutines can solve both positive-definite and indefinite systems. Intel MKL includes a solver based on the PARDISO* sparse solver, referred to as Intel MKL PARDISO, as well as an alternative set of user callable direct sparse solver routines.

If you use the Intel MKL PARDISO sparse solver, please cite:

O.Schenk and K.Gartner. Solving unsymmetric sparse systems of linear equations with PARDISO. J. of Future Generation Computer Systems, 20(3):475-487, 2004.

Intel MKL provides also an iterative sparse solver (see [Chapter 8](#)) that uses Sparse BLAS level 2 and 3 routines and works with different sparse data formats.

Extended Eigensolver Routines

The [Extended Eigensolver RCI Routines](#) is a set of high-performance numerical routines for solving standard ($Ax = \lambda x$) and generalized ($Ax = \lambda Bx$) eigenvalue problems, where A and B are symmetric or Hermitian. It yields all the eigenvalues and eigenvectors within a given search interval. It is based on the Feast algorithm, an innovative fast and stable numerical algorithm presented in [\[Polizzi09\]](#), which deviates fundamentally from the traditional Krylov subspace iteration based techniques (Arnoldi and Lanczos algorithms [\[Bai00\]](#)) or other Davidson-Jacobi techniques [\[Sleijpen96\]](#). The Feast algorithm is inspired by the density-matrix representation and contour integration technique in quantum mechanics.

It is free from orthogonalization procedures. Its main computational tasks consist of solving very few inner independent linear systems with multiple right-hand sides and one reduced eigenvalue problem orders of magnitude smaller than the original one. The Feast algorithm combines simplicity and efficiency and offers many important capabilities for achieving high performance, robustness, accuracy, and scalability on parallel architectures. This algorithm is expected to significantly augment numerical performance in large-scale modern applications.

Some of the characteristics of the Feast algorithm [\[Polizzi09\]](#) are:

- Converges quickly in 2-3 iterations with very high accuracy
- Naturally captures all eigenvalue multiplicities
- No explicit orthogonalization procedure
- Can reuse the basis of pre-computed subspace as suitable initial guess for performing outer-refinement iterations

This capability can also be used for solving a series of eigenvalue problems that are close one another.

- The number of internal iterations is independent of the size of the system and the number of eigenpairs in the search interval
- The inner linear systems can be solved either iteratively (even with modest relative residual error) or directly

VM Functions

The Vector Mathematics functions (see [Chapter 9](#)) include a set of highly optimized implementations of certain computationally expensive core mathematical functions (power, trigonometric, exponential, hyperbolic, etc.) that operate on vectors of real and complex numbers.

Application programs that might significantly improve performance with VM include nonlinear programming software, integrals computation, and many others. VM provides interfaces both for Fortran and C languages.

Statistical Functions

Vector Statistics (VS) contains three sets of functions (see [Chapter 10](#)) providing:

- Pseudorandom, quasi-random, and non-deterministic random number generator subroutines implementing basic continuous and discrete distributions. To provide best performance, the VS subroutines use calls to highly optimized Basic Random Number Generators (BRNGs) and a set of vector mathematical functions.
- A wide variety of convolution and correlation operations.
- Initial statistical analysis of raw single and double precision multi-dimensional datasets.

Fourier Transform Functions

The Intel® MKL multidimensional Fast Fourier Transform (FFT) functions with mixed radix support (see [Chapter 11](#)) provide uniformity of discrete Fourier transform computation and combine functionality with ease of use. Both Fortran and C interface specification are given. There is also a cluster version of FFT functions, which runs on distributed-memory architectures and is provided only for Intel® 64 and Intel® Many Integrated Core architectures.

The FFT functions provide fast computation via the FFT algorithms for arbitrary lengths. See *the Intel® MKL User's Guide* for the specific radices supported.

Partial Differential Equations Support

Intel® MKL provides tools for solving Partial Differential Equations (PDE) (see [Chapter 13](#)). These tools are Trigonometric Transform interface routines and Poisson Solver.

The Trigonometric Transform routines may be helpful to users who implement their own solvers similar to the Intel MKL Poisson Solver. The users can improve performance of their solvers by using fast sine, cosine, and staggered cosine transforms implemented in the Trigonometric Transform interface.

The Poisson Solver is designed for fast solving of simple Helmholtz, Poisson, and Laplace problems. The Trigonometric Transform interface, which underlies the solver, is based on the Intel MKL FFT interface (refer to [Chapter 11](#)), optimized for Intel® processors.

Nonlinear Optimization Problem Solvers

Intel® MKL provides Nonlinear Optimization Problem Solver routines (see [Chapter 14](#)) that can be used to solve nonlinear least squares problems with or without linear (bound) constraints through the Trust-Region (TR) algorithms and compute Jacobi matrix by central differences.

Support Functions

The Intel® MKL support functions (see [Chapter 15](#)) are used to support the operation of the Intel MKL software and provide basic information on the library and library operation, such as the current library version, timing, setting and measuring of CPU frequency, error handling, and memory allocation.

Starting from release 10.0, the Intel MKL support functions provide additional threading control.

Starting from release 10.1, Intel MKL selectively supports a *Progress Routine* feature to track progress of a lengthy computation and/or interrupt the computation using a callback function mechanism. The user application can define a function called `mkl_progress` that is regularly called from the Intel MKL routine supporting the progress routine feature. See [the Progress Routines](#) section in [Chapter 15](#) for reference. Refer to a specific LAPACK or DSS/PARDISO function description to see whether the function supports this feature or not.

BLACS Routines

The Intel® Math Kernel Library implements routines from the BLACS (Basic Linear Algebra Communication Subprograms) package (see [Chapter 16](#)) that are used to support a linear algebra oriented message passing interface that may be implemented efficiently and uniformly across a large range of distributed memory platforms.

The original versions of BLACS from which that part of Intel MKL was derived can be obtained from <http://www.netlib.org/blacs/index.html>. The authors of BLACS are Jack Dongarra and R. Clint Whaley.

Data Fitting Functions

The Data Fitting component includes a set of highly-optimized implementations of algorithms for the following spline-based computations:

- spline construction
- interpolation including computation of derivatives and integration
- search

The algorithms operate on single and double vector-valued functions set in the points of the given partition. You can use Data Fitting algorithms in applications that are based on data approximation. See [Data Fitting Functions](#) for more information.

Optimization Notice

Intel's compilers may or may not optimize to the same degree for non-Intel microprocessors for optimizations that are not unique to Intel microprocessors. These optimizations include SSE2, SSE3, and SSSE3 instruction sets and other optimizations. Intel does not guarantee the availability, functionality, or effectiveness of any optimization on microprocessors not manufactured by Intel. Microprocessor-dependent optimizations in this product are intended for use with Intel microprocessors. Certain optimizations not specific to Intel microarchitecture are reserved for Intel microprocessors. Please refer to the applicable product User and Reference Guides for more information regarding the specific instruction sets covered by this notice.

Notice revision #20110804

Performance Enhancements

The Intel® Math Kernel Library has been optimized by exploiting both processor and system features and capabilities. Special care has been given to those routines that most profit from cache-management techniques. These especially include matrix-matrix operation routines such as `dgemm()`.

In addition, code optimization techniques have been applied to minimize dependencies of scheduling integer and floating-point units on the results within the processor.

The major optimization techniques used throughout the library include:

- Loop unrolling to minimize loop management costs

- Blocking of data to improve data reuse opportunities
- Copying to reduce chances of data eviction from cache
- Data prefetching to help hide memory latency
- Multiple simultaneous operations (for example, dot products in `dgemm`) to eliminate stalls due to arithmetic unit pipelines
- Use of hardware features such as the SIMD arithmetic units, where appropriate

These are techniques from which the arithmetic code benefits the most.

Optimization Notice

Intel's compilers may or may not optimize to the same degree for non-Intel microprocessors for optimizations that are not unique to Intel microprocessors. These optimizations include SSE2, SSE3, and SSSE3 instruction sets and other optimizations. Intel does not guarantee the availability, functionality, or effectiveness of any optimization on microprocessors not manufactured by Intel. Microprocessor-dependent optimizations in this product are intended for use with Intel microprocessors. Certain optimizations not specific to Intel microarchitecture are reserved for Intel microprocessors. Please refer to the applicable product User and Reference Guides for more information regarding the specific instruction sets covered by this notice.

Notice revision #20110804

Parallelism

In addition to the performance enhancements discussed above, Intel® MKL offers performance gains through parallelism provided by the symmetric multiprocessing performance (SMP) feature. You can obtain improvements from SMP in the following ways:

- One way is based on user-managed threads in the program and further distribution of the operations over the threads based on data decomposition, domain decomposition, control decomposition, or some other parallelizing technique. Each thread can use any of the Intel MKL functions (except for the deprecated `zlacon` LAPACK routine) because the library has been designed to be thread-safe.
- Another method is to use the FFT and BLAS level 3 routines. They have been parallelized and require no alterations of your application to gain the performance enhancements of multiprocessing. Performance using multiple processors on the level 3 BLAS shows excellent scaling. Since the threads are called and managed within the library, the application does not need to be recompiled thread-safe.
- Yet another method is to use *tuned LAPACK routines*. Currently these include the single- and double precision flavors of routines for *QR* factorization of general matrices, triangular factorization of general and symmetric positive-definite matrices, solving systems of equations with such matrices, as well as solving symmetric eigenvalue problems.

For instructions on setting the number of available processors for the BLAS level 3 and LAPACK routines, see *Intel® MKL User's Guide*.

Optimization Notice

Intel's compilers may or may not optimize to the same degree for non-Intel microprocessors for optimizations that are not unique to Intel microprocessors. These optimizations include SSE2, SSE3, and SSSE3 instruction sets and other optimizations. Intel does not guarantee the availability, functionality, or effectiveness of any optimization on microprocessors not manufactured by Intel. Microprocessor-dependent optimizations in this product are intended for use with Intel microprocessors. Certain optimizations not specific to Intel microarchitecture are reserved for Intel microprocessors. Please refer to the applicable product User and Reference Guides for more information regarding the specific instruction sets covered by this notice.

Notice revision #20110804

BLAS and Sparse BLAS Routines

This chapter describes the Intel® Math Kernel Library implementation of the BLAS and Sparse BLAS routines, and BLAS-like extensions. The routine descriptions are arranged in several sections:

- [BLAS Level 1 Routines](#) (vector-vector operations)
- [BLAS Level 2 Routines](#) (matrix-vector operations)
- [BLAS Level 3 Routines](#) (matrix-matrix operations)
- [Sparse BLAS Level 1 Routines](#) (vector-vector operations).
- [Sparse BLAS Level 2 and Level 3 Routines](#) (matrix-vector and matrix-matrix operations)
- [BLAS-like Extensions](#)

Each section presents the routine and function group descriptions in alphabetical order by routine or function group name; for example, the `?asum` group, the `?axpy` group. The question mark in the group name corresponds to different character codes indicating the data type (`s`, `d`, `c`, and `z` or their combination); see [Routine Naming Conventions](#).

When BLAS or Sparse BLAS routines encounter an error, they call the error reporting routine `xerbla`.

In BLAS Level 1 groups `i?amax` and `i?amin`, an "i" is placed before the data-type indicator and corresponds to the index of an element in the vector. These groups are placed in the end of the BLAS Level 1 section.

BLAS Routines

Routine Naming Conventions

BLAS routine names have the following structure:

`<character> <name> <mod> ()`

The `<character>` field indicates the data type:

<code>s</code>	real, single precision
<code>c</code>	complex, single precision
<code>d</code>	real, double precision
<code>z</code>	complex, double precision

Some routines and functions can have combined character codes, such as `sc` or `dz`.

For example, the function `scasum` uses a complex input array and returns a real value.

The `<name>` field, in BLAS level 1, indicates the operation type. For example, the BLAS level 1 routines `?dot`, `?rot`, `?swap` compute a vector dot product, vector rotation, and vector swap, respectively.

In BLAS level 2 and 3, `<name>` reflects the matrix argument type:

<code>ge</code>	general matrix
<code>gb</code>	general band matrix
<code>sy</code>	symmetric matrix

sp	symmetric matrix (packed storage)
sb	symmetric band matrix
he	Hermitian matrix
hp	Hermitian matrix (packed storage)
hb	Hermitian band matrix
tr	triangular matrix
tp	triangular matrix (packed storage)
tb	triangular band matrix.

The `<mod>` field, if present, provides additional details of the operation. BLAS level 1 names can have the following characters in the `<mod>` field:

c	conjugated vector
u	unconjugated vector
g	Givens rotation construction
m	modified Givens rotation
mg	modified Givens rotation construction

BLAS level 2 names can have the following characters in the `<mod>` field:

mv	matrix-vector product
sv	solving a system of linear equations with a single unknown vector
r	rank-1 update of a matrix
r2	rank-2 update of a matrix.

BLAS level 3 names can have the following characters in the `<mod>` field:

mm	matrix-matrix product
sm	solving a system of linear equations with multiple unknown vectors
rk	rank- <i>k</i> update of a matrix
r2k	rank-2 <i>k</i> update of a matrix.

The examples below illustrate how to interpret BLAS routine names:

ddot	<code><d> <dot></code> : double-precision real vector-vector dot product
cdotc	<code><c> <dot> <c></code> : complex vector-vector dot product, conjugated
scasum	<code><sc> <asum></code> : sum of magnitudes of vector elements, single precision real output and single precision complex input
cdotu	<code><c> <dot> <u></code> : vector-vector dot product, unconjugated, complex
sgemv	<code><s> <ge> <mv></code> : matrix-vector product, general matrix, single precision

`ztrmm` `<z>` `<tr>` `<mm>`: matrix-matrix product, triangular matrix, double-precision complex.

Sparse BLAS level 1 naming conventions are similar to those of BLAS level 1. For more information, see [Naming Conventions](#).

Fortran 95 Interface Conventions

Fortran 95 interface to BLAS and Sparse BLAS Level 1 routines is implemented through wrappers that call respective FORTRAN 77 routines. This interface uses such features of Fortran 95 as assumed-shape arrays and optional arguments to provide simplified calls to BLAS and Sparse BLAS Level 1 routines with fewer parameters.

NOTE

For BLAS, Intel MKL offers two types of Fortran 95 interfaces:

- using `mkl_blas.fi` only through `include 'mkl.fi'` statement. Such interfaces allow you to make use of the original LAPACK routines with all their arguments
- using `blas.f90` that includes improved interfaces. This file is used to generate the module files `blas95.mod` and `f95_precision.mod`. See also section "Fortran 95 interfaces and wrappers to LAPACK and BLAS" of *Intel® MKL User's Guide* for details. The module files are used to process the FORTRAN use clauses referencing the BLAS interface: `use blas95` and `use f95_precision`.

The main conventions used in Fortran 95 interface are as follows:

- The names of parameters used in Fortran 95 interface are typically the same as those used for the respective generic (FORTRAN 77) interface. In rare cases formal argument names may be different.
- Some input parameters such as array dimensions are not required in Fortran 95 and are skipped from the calling sequence. Array dimensions are reconstructed from the user data that must exactly follow the required array shape.
- A parameter can be skipped if its value is completely defined by the presence or absence of another parameter in the calling sequence, and the restored value is the only meaningful value for the skipped parameter.
- Parameters specifying the increment values `incx` and `incy` are skipped. In most cases their values are equal to 1. In Fortran 95 an increment with different value can be directly established in the corresponding parameter.
- Some generic parameters are declared as optional in Fortran 95 interface and may or may not be present in the calling sequence. A parameter can be declared optional if it satisfies one of the following conditions:
 1. It can take only a few possible values. The default value of such parameter typically is the first value in the list; all exceptions to this rule are explicitly stated in the routine description.
 2. It has a natural default value.

Optional parameters are given in square brackets in Fortran 95 call syntax.

The particular rules used for reconstructing the values of omitted optional parameters are specific for each routine and are detailed in the respective "Fortran 95 Notes" subsection at the end of routine specification section. If this subsection is omitted, the Fortran 95 interface for the given routine does not differ from the corresponding FORTRAN 77 interface.

Note that this interface is not implemented in the current version of Sparse BLAS Level 2 and Level 3 routines.

Matrix Storage Schemes

Matrix arguments of BLAS routines can use the following storage schemes:

- *Full storage*: a matrix A is stored in a two-dimensional array a , with the matrix element a_{ij} stored in the array element $a(i, j)$.

- *Packed storage* scheme allows you to store symmetric, Hermitian, or triangular matrices more compactly: the upper or lower triangle of the matrix is packed by columns in a one-dimensional array.
- *Band storage*: a band matrix is stored compactly in a two-dimensional array: columns of the matrix are stored in the corresponding columns of the array, and *diagonals* of the matrix are stored in rows of the array.

For more information on matrix storage schemes, see [Matrix Arguments](#) in Appendix B.

BLAS Level 1 Routines and Functions

BLAS Level 1 includes routines and functions, which perform vector-vector operations. [Table “BLAS Level 1 Routine Groups and Their Data Types”](#) lists the BLAS Level 1 routine and function groups and the data types associated with them.

BLAS Level 1 Routine and Function Groups and Their Data Types

Routine or Function Group	Data Types	Description
?asum	s, d, sc, dz	Sum of vector magnitudes (functions)
?axpy	s, d, c, z	Scalar-vector product (routines)
?copy	s, d, c, z	Copy vector (routines)
?dot	s, d	Dot product (functions)
?sdot	sd, d	Dot product with double precision (functions)
?dotc	c, z	Dot product conjugated (functions)
?dotu	c, z	Dot product unconjugated (functions)
?nrm2	s, d, sc, dz	Vector 2-norm (Euclidean norm) (functions)
?rot	s, d, cs, zd	Plane rotation of points (routines)
?rotg	s, d, c, z	Generate Givens rotation of points (routines)
?rotm	s, d	Modified Givens plane rotation of points (routines)
?rotmg	s, d	Generate modified Givens plane rotation of points (routines)
?scal	s, d, c, z, cs, zd	Vector-scalar product (routines)
?swap	s, d, c, z	Vector-vector swap (routines)
i?amax	s, d, c, z	Index of the maximum absolute value element of a vector (functions)
i?amin	s, d, c, z	Index of the minimum absolute value element of a vector (functions)
?cabs1	s, d	Auxiliary functions, compute the absolute value of a complex number of single or double precision

[?asum](#)

Computes the sum of magnitudes of the vector elements.

Syntax

```
res = sasum(n, x, incx)
```

```

res = scasum(n, x, incx)
res = dasum(n, x, incx)
res = dzasum(n, x, incx)
res = asum(x)

```

Include Files

- `mkl.fi, blas.f90`

Description

The `?asum` routine computes the sum of the magnitudes of elements of a real vector, or the sum of magnitudes of the real and imaginary parts of elements of a complex vector:

$$res = |Re x_1| + |Im x_1| + |Re x_2| + |Im x_2| + \dots + |Re x_n| + |Im x_n|,$$

where x is a vector with n elements.

Input Parameters

n	INTEGER. Specifies the number of elements in vector x .
x	REAL for <code>sasum</code> DOUBLE PRECISION for <code>dasum</code> COMPLEX for <code>scasum</code> DOUBLE COMPLEX for <code>dzasum</code>
	Array, size at least $(1 + (n-1)*abs(incx))$.
$incx$	INTEGER. Specifies the increment for indexing vector x .

Output Parameters

res	REAL for <code>sasum</code> DOUBLE PRECISION for <code>dasum</code> REAL for <code>scasum</code> DOUBLE PRECISION for <code>dzasum</code> Contains the sum of magnitudes of real and imaginary parts of all elements of the vector.
-------	---

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine `asum` interface are the following:

x	Holds the array of size n .
-----	-------------------------------

?axpy

Computes a vector-scalar product and adds the result to a vector.

Syntax

```
call saxpy(n, a, x, incx, y, incy)
call daxpy(n, a, x, incx, y, incy)
call caxpy(n, a, x, incx, y, incy)
call zaxpy(n, a, x, incx, y, incy)
call axpy(x, y [,a])
```

Include Files

- mkl.fi, blas.f90

Description

The ?axpy routines perform a vector-vector operation defined as

```
y := a*x + y
```

where:

a is a scalar

x and *y* are vectors each with a number of elements that equals *n*.

Input Parameters

<i>n</i>	INTEGER. Specifies the number of elements in vectors <i>x</i> and <i>y</i> .
<i>a</i>	REAL for saxpy DOUBLE PRECISION for daxpy COMPLEX for caxpy DOUBLE COMPLEX for zaxpy Specifies the scalar <i>a</i> .
<i>x</i>	REAL for saxpy DOUBLE PRECISION for daxpy COMPLEX for caxpy DOUBLE COMPLEX for zaxpy Array, size at least $(1 + (n-1)*abs(incx))$.
<i>incx</i>	INTEGER. Specifies the increment for the elements of <i>x</i> .
<i>y</i>	REAL for saxpy DOUBLE PRECISION for daxpy COMPLEX for caxpy DOUBLE COMPLEX for zaxpy

Array, size at least $(1 + (n-1) * \text{abs}(incy))$.

incy INTEGER. Specifies the increment for the elements of *y*.

Output Parameters

y Contains the updated vector *y*.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine `axpy` interface are the following:

x Holds the array of size *n*.
y Holds the array of size *n*.
a The default value is 1.

?copy

Copies vector to another vector.

Syntax

```
call scopy(n, x, incx, y, incy)
call dcopy(n, x, incx, y, incy)
call ccopy(n, x, incx, y, incy)
call zcopy(n, x, incx, y, incy)
call copy(x, y)
```

Include Files

- `mkl.fi`, `blas.f90`

Description

The `?copy` routines perform a vector-vector operation defined as

$y = x,$

where *x* and *y* are vectors.

Input Parameters

n INTEGER. Specifies the number of elements in vectors *x* and *y*.
x REAL for `scopy`
 DOUBLE PRECISION for `dcopy`
 COMPLEX for `ccopy`
 DOUBLE COMPLEX for `zcopy`

	Array, size at least $(1 + (n-1) * \text{abs}(incx))$.
<i>incx</i>	INTEGER. Specifies the increment for the elements of <i>x</i> .
<i>y</i>	REAL for <i>scopy</i> DOUBLE PRECISION for <i>dcopy</i> COMPLEX for <i>ccopy</i> DOUBLE COMPLEX for <i>zcopy</i> Array, size at least $(1 + (n-1) * \text{abs}(incy))$.
<i>incy</i>	INTEGER. Specifies the increment for the elements of <i>y</i> .

Output Parameters

<i>y</i>	Contains a copy of the vector <i>x</i> if <i>n</i> is positive. Otherwise, parameters are unaltered.
----------	--

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine *copy* interface are the following:

<i>x</i>	Holds the vector with the number of elements <i>n</i> .
<i>y</i>	Holds the vector with the number of elements <i>n</i> .

?dot

Computes a vector-vector dot product.

Syntax

```
res = sdot(n, x, incx, y, incy)
res = ddot(n, x, incx, y, incy)
res = dot(x, y)
```

Include Files

- `mkl.fi, blas.f90`

Description

The *?dot* routines perform a vector-vector reduction operation defined as

$$res = \sum_{i=1}^n x_i * y_i,$$

where x_i and y_i are elements of vectors *x* and *y*.

Input Parameters

<i>n</i>	INTEGER. Specifies the number of elements in vectors <i>x</i> and <i>y</i> .
<i>x</i>	REAL for <code>sdot</code> DOUBLE PRECISION for <code>ddot</code> Array, size at least $(1 + (n-1) * \text{abs}(incx))$.
<i>incx</i>	INTEGER. Specifies the increment for the elements of <i>x</i> .
<i>y</i>	REAL for <code>sdot</code> DOUBLE PRECISION for <code>ddot</code> Array, size at least $(1 + (n-1) * \text{abs}(incy))$.
<i>incy</i>	INTEGER. Specifies the increment for the elements of <i>y</i> .

Output Parameters

<i>res</i>	REAL for <code>sdot</code> DOUBLE PRECISION for <code>ddot</code> Contains the result of the dot product of <i>x</i> and <i>y</i> , if <i>n</i> is positive. Otherwise, <i>res</i> contains 0.
------------	--

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine `dot` interface are the following:

<i>x</i>	Holds the vector with the number of elements <i>n</i> .
<i>y</i>	Holds the vector with the number of elements <i>n</i> .

?sdot

Computes a vector-vector dot product with double precision.

Syntax

```
res = sdsdot(n, sb, sx, incx, sy, incy)
res = dsdot(n, sx, incx, sy, incy)
res = sdot(sx, sy)
res = sdot(sx, sy, sb)
```

Include Files

- `mkl.fi`, `blas.f90`

Description

The `?sdot` routines compute the inner product of two vectors with double precision. Both routines use double precision accumulation of the intermediate results, but the `sdsdot` routine outputs the final result in single precision, whereas the `dsdot` routine outputs the double precision result. The function `sdsdot` also adds scalar value `sb` to the inner product.

Input Parameters

<code>n</code>	INTEGER. Specifies the number of elements in the input vectors <code>sx</code> and <code>sy</code> .
<code>sb</code>	REAL. Single precision scalar to be added to inner product (for the function <code>sdsdot</code> only).
<code>sx, sy</code>	REAL. Arrays, size at least $(1+(n-1)*abs(incx))$ and $(1+(n-1)*abs(incy))$, respectively. Contain the input single precision vectors.
<code>incx</code>	INTEGER. Specifies the increment for the elements of <code>sx</code> .
<code>incy</code>	INTEGER. Specifies the increment for the elements of <code>sy</code> .

Output Parameters

<code>res</code>	REAL for <code>sdsdot</code> DOUBLE PRECISION for <code>dsdot</code> Contains the result of the dot product of <code>sx</code> and <code>sy</code> (with <code>sb</code> added for <code>sdsdot</code>), if <code>n</code> is positive. Otherwise, <code>res</code> contains <code>sb</code> for <code>sdsdot</code> and 0 for <code>dsdot</code> .
------------------	--

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine `sdot` interface are the following:

<code>sx</code>	Holds the vector with the number of elements <code>n</code> .
<code>sy</code>	Holds the vector with the number of elements <code>n</code> .

NOTE

Note that scalar parameter `sb` is declared as a required parameter in Fortran 95 interface for the function `sdot` to distinguish between function flavors that output final result in different precision.

?dotc

Computes a dot product of a conjugated vector with another vector.

Syntax

```
res = cdotc(n, x, incx, y, incy)
res = zdotc(n, x, incx, y, incy)
res = dotc(x, y)
```

Include Files

- `mk1.fi`, `blas.f90`

Description

The `?dotc` routines perform a vector-vector operation defined as:

$$res = \sum_{i=1}^n \text{conjg}(x_i) * y_i,$$

where x_i and y_i are elements of vectors x and y .

Input Parameters

n	INTEGER. Specifies the number of elements in vectors x and y .
x	COMPLEX for <code>cdotc</code> DOUBLE COMPLEX for <code>zdotc</code> Array, size at least $(1 + (n - 1) * \text{abs}(\text{incx}))$.
incx	INTEGER. Specifies the increment for the elements of x .
y	COMPLEX for <code>cdotc</code> DOUBLE COMPLEX for <code>zdotc</code> Array, size at least $(1 + (n - 1) * \text{abs}(\text{incy}))$.
incy	INTEGER. Specifies the increment for the elements of y .

Output Parameters

res	COMPLEX for <code>cdotc</code> DOUBLE COMPLEX for <code>zdotc</code> Contains the result of the dot product of the conjugated x and unconjugated y , if n is positive. Otherwise, it contains 0.
-------	--

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine `dotc` interface are the following:

x	Holds the vector with the number of elements n .
y	Holds the vector with the number of elements n .

?dotu

Computes a vector-vector dot product.

Syntax

`res = cdotu(n, x, incx, y, incy)`

```
res = zdotu(n, x, incx, y, incy)
```

```
res = dotu(x, y)
```

Include Files

- `mkl.fi`, `blas.f90`

Description

The `?dotu` routines perform a vector-vector reduction operation defined as

$$res = \sum_{i=1}^n x_i * y_i$$

where x_i and y_i are elements of complex vectors x and y .

Input Parameters

<i>n</i>	INTEGER. Specifies the number of elements in vectors x and y .
<i>x</i>	COMPLEX for <code>cdotu</code> DOUBLE COMPLEX for <code>zdotu</code> Array, size at least $(1 + (n - 1) * \text{abs}(\text{incx}))$.
<i>incx</i>	INTEGER. Specifies the increment for the elements of x .
<i>y</i>	COMPLEX for <code>cdotu</code> DOUBLE COMPLEX for <code>zdotu</code> Array, size at least $(1 + (n - 1) * \text{abs}(\text{incy}))$.
<i>incy</i>	INTEGER. Specifies the increment for the elements of y .

Output Parameters

<i>res</i>	COMPLEX for <code>cdotu</code> DOUBLE COMPLEX for <code>zdotu</code> Contains the result of the dot product of x and y , if n is positive. Otherwise, it contains 0.
------------	--

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine `dotu` interface are the following:

<i>x</i>	Holds the vector with the number of elements n .
<i>y</i>	Holds the vector with the number of elements n .

?nrm2

Computes the Euclidean norm of a vector.

Syntax

```

res = snrm2(n, x, incx)
res = dnrm2(n, x, incx)
res = scnrm2(n, x, incx)
res = dznm2(n, x, incx)
res = nrm2(x)

```

Include Files

- mkl.fi, blas.f90

Description

The ?nrm2 routines perform a vector reduction operation defined as

```
res = ||x||,
```

where:

x is a vector,

res is a value containing the Euclidean norm of the elements of *x*.

Input Parameters

<i>n</i>	INTEGER. Specifies the number of elements in vector <i>x</i> .
<i>x</i>	REAL for snrm2 DOUBLE PRECISION for dnrm2 COMPLEX for scnrm2 DOUBLE COMPLEX for dznm2 Array, size at least $(1 + (n - 1) * \text{abs}(incx))$.
<i>incx</i>	INTEGER. Specifies the increment for the elements of <i>x</i> .

Output Parameters

<i>res</i>	REAL for snrm2 DOUBLE PRECISION for dnrm2 REAL for scnrm2 DOUBLE PRECISION for dznm2 Contains the Euclidean norm of the vector <i>x</i> .
------------	---

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine `nrm2` interface are the following:

x Holds the vector with the number of elements n .

?rot

Performs rotation of points in the plane.

Syntax

```
call srot( $n$ ,  $x$ ,  $incx$ ,  $y$ ,  $incy$ ,  $c$ ,  $s$ )
call drot( $n$ ,  $x$ ,  $incx$ ,  $y$ ,  $incy$ ,  $c$ ,  $s$ )
call csrot( $n$ ,  $x$ ,  $incx$ ,  $y$ ,  $incy$ ,  $c$ ,  $s$ )
call zdrot( $n$ ,  $x$ ,  $incx$ ,  $y$ ,  $incy$ ,  $c$ ,  $s$ )
call rot( $x$ ,  $y$ ,  $c$ ,  $s$ )
```

Include Files

- mkl.fi, blas.f90

Description

Given two complex vectors x and y , each vector element of these vectors is replaced as follows:

$$x_i = c \cdot x_i + s \cdot y_i$$

$$y_i = c \cdot y_i - s \cdot x_i$$

Input Parameters

n	INTEGER. Specifies the number of elements in vectors x and y .
x	REAL for srot DOUBLE PRECISION for drot COMPLEX for csrot DOUBLE COMPLEX for zdrot Array, size at least $(1 + (n-1) \cdot \text{abs}(incx))$.
$incx$	INTEGER. Specifies the increment for the elements of x .
y	REAL for srot DOUBLE PRECISION for drot COMPLEX for csrot DOUBLE COMPLEX for zdrot Array, size at least $(1 + (n-1) \cdot \text{abs}(incy))$.
$incy$	INTEGER. Specifies the increment for the elements of y .
c	REAL for srot DOUBLE PRECISION for drot REAL for csrot DOUBLE PRECISION for zdrot

A scalar.

s REAL for srot
 DOUBLE PRECISION for drot
 REAL for csrot
 DOUBLE PRECISION for zdrot
 A scalar.

Output Parameters

x Each element is replaced by $c*x + s*y$.
y Each element is replaced by $c*y - s*x$.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine `rot` interface are the following:

x Holds the vector with the number of elements n .
y Holds the vector with the number of elements n .

?rotg

Computes the parameters for a Givens rotation.

Syntax

```
call srotg(a, b, c, s)
call drotg(a, b, c, s)
call crotg(a, b, c, s)
call zrotg(a, b, c, s)
call rotg(a, b, c, s)
```

Include Files

- `mkl.fi, blas.f90`

Description

Given the Cartesian coordinates (a, b) of a point, these routines return the parameters c , s , r , and z associated with the Givens rotation. The parameters c and s define a unitary matrix such that:

$$\begin{bmatrix} c & s \\ -s & c \end{bmatrix} \begin{bmatrix} a \\ b \end{bmatrix} = \begin{bmatrix} r \\ 0 \end{bmatrix}$$

The parameter z is defined such that if $|a| > |b|$, z is s ; otherwise if c is not 0 z is $1/c$; otherwise z is 1.

See a more accurate LAPACK version [?lartg](#).

Input Parameters

<i>a</i>	<p>REAL for srotg</p> <p>DOUBLE PRECISION for drotg</p> <p>COMPLEX for crotg</p> <p>DOUBLE COMPLEX for zrotg</p> <p>Provides the x-coordinate of the point p.</p>
<i>b</i>	<p>REAL for srotg</p> <p>DOUBLE PRECISION for drotg</p> <p>COMPLEX for crotg</p> <p>DOUBLE COMPLEX for zrotg</p> <p>Provides the y-coordinate of the point p.</p>

Output Parameters

<i>a</i>	Contains the parameter <i>r</i> associated with the Givens rotation.
<i>b</i>	Contains the parameter <i>z</i> associated with the Givens rotation.
<i>c</i>	<p>REAL for srotg</p> <p>DOUBLE PRECISION for drotg</p> <p>REAL for crotg</p> <p>DOUBLE PRECISION for zrotg</p> <p>Contains the parameter <i>c</i> associated with the Givens rotation.</p>
<i>s</i>	<p>REAL for srotg</p> <p>DOUBLE PRECISION for drotg</p> <p>COMPLEX for crotg</p> <p>DOUBLE COMPLEX for zrotg</p> <p>Contains the parameter <i>s</i> associated with the Givens rotation.</p>

?rotm

Performs modified Givens rotation of points in the plane.

Syntax

```
call srotm(n, x, incx, y, incy, param)
call drotm(n, x, incx, y, incy, param)
call rotm(x, y, param)
```

Include Files

- mkl.fi, blas.f90

Description

Given two vectors x and y , each vector element of these vectors is replaced as follows:

$$\begin{bmatrix} x_i \\ y_i \end{bmatrix} = H \begin{bmatrix} x_i \\ y_i \end{bmatrix}$$

for $i=1$ to n , where H is a modified Givens transformation matrix whose values are stored in the `param(2)` through `param(5)` array. See discussion on the `param` argument.

Input Parameters

<code>n</code>	INTEGER. Specifies the number of elements in vectors x and y .
<code>x</code>	REAL for <code>srotm</code> DOUBLE PRECISION for <code>drotm</code> Array, size at least $(1 + (n - 1) * \text{abs}(\text{incx}))$.
<code>incx</code>	INTEGER. Specifies the increment for the elements of x .
<code>y</code>	REAL for <code>srotm</code> DOUBLE PRECISION for <code>drotm</code> Array, size at least $(1 + (n - 1) * \text{abs}(\text{incy}))$.
<code>incy</code>	INTEGER. Specifies the increment for the elements of y .
<code>param</code>	REAL for <code>srotm</code> DOUBLE PRECISION for <code>drotm</code> Array, size 5. The elements of the <code>param</code> array are: <code>param(1)</code> contains a switch, <code>flag</code> . <code>param(2-5)</code> contain h_{11} , h_{21} , h_{12} , and h_{22} , respectively, the components of the array H . Depending on the values of <code>flag</code> , the components of H are set as follows: $\text{flag} = -1.0: H = \begin{bmatrix} h_{11} & h_{12} \\ h_{21} & h_{22} \end{bmatrix}$ $\text{flag} = 0.0: H = \begin{bmatrix} 1.0 & h_{12} \\ h_{21} & 1.0 \end{bmatrix}$ $\text{flag} = 1.0: H = \begin{bmatrix} h_{11} & 1.0 \\ -1.0 & h_{22} \end{bmatrix}$ $\text{flag} = -2.0: H = \begin{bmatrix} 1.0 & 0.0 \\ 0.0 & 1.0 \end{bmatrix}$ In the last three cases, the matrix entries of 1.0, -1.0, and 0.0 are assumed based on the value of <code>flag</code> and are not required to be set in the <code>param</code> vector.

Output Parameters

x	Each element $x(i)$ is replaced by $h_{11}*x(i) + h_{12}*y(i)$.
y	Each element $y(i)$ is replaced by $h_{21}*x(i) + h_{22}*y(i)$.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine `rotm` interface are the following:

x	Holds the vector with the number of elements n .
y	Holds the vector with the number of elements n .

?rotmg

Computes the parameters for a modified Givens rotation.

Syntax

```
call srotmg(d1, d2, x1, y1, param)
call drotmg(d1, d2, x1, y1, param)
call rotmg(d1, d2, x1, y1, param)
```

Include Files

- `mkl.fi, blas.f90`

Description

Given Cartesian coordinates $(x1, y1)$ of an input vector, these routines compute the components of a modified Givens transformation matrix H that zeros the y -component of the resulting vector:

$$\begin{bmatrix} x1 \\ 0 \end{bmatrix} = H \begin{bmatrix} x1\sqrt{d1} \\ y1\sqrt{d2} \end{bmatrix}$$

Input Parameters

$d1$	REAL for <code>srotmg</code> DOUBLE PRECISION for <code>drotmg</code> Provides the scaling factor for the x -coordinate of the input vector.
$d2$	REAL for <code>srotmg</code> DOUBLE PRECISION for <code>drotmg</code> Provides the scaling factor for the y -coordinate of the input vector.
$x1$	REAL for <code>srotmg</code> DOUBLE PRECISION for <code>drotmg</code> Provides the x -coordinate of the input vector.

y1 REAL for srotmg
 DOUBLE PRECISION for drotmg
 Provides the y-coordinate of the input vector.

Output Parameters

d1 REAL for srotmg
 DOUBLE PRECISION for drotmg
 Provides the first diagonal element of the updated matrix.

d2 REAL for srotmg
 DOUBLE PRECISION for drotmg
 Provides the second diagonal element of the updated matrix.

x1 REAL for srotmg
 DOUBLE PRECISION for drotmg
 Provides the x-coordinate of the rotated vector before scaling.

param REAL for srotmg
 DOUBLE PRECISION for drotmg
 Array, size 5.
 The elements of the *param* array are:
param(1) contains a switch, *flag*. the other array elements *param*(2-5) contain the components of the array *H*: h_{11} , h_{21} , h_{12} , and h_{22} , respectively.
 Depending on the values of *flag*, the components of *H* are set as follows:

$$flag = -1.0: H = \begin{bmatrix} h_{11} & h_{12} \\ h_{21} & h_{22} \end{bmatrix}$$

$$flag = 0.0: H = \begin{bmatrix} 1.0 & h_{12} \\ h_{21} & 1.0 \end{bmatrix}$$

$$flag = 1.0: H = \begin{bmatrix} h_{11} & 1.0 \\ -1.0 & h_{22} \end{bmatrix}$$

$$flag = -2.0: H = \begin{bmatrix} 1.0 & 0.0 \\ 0.0 & 1.0 \end{bmatrix}$$

In the last three cases, the matrix entries of 1.0, -1.0, and 0.0 are assumed based on the value of *flag* and are not required to be set in the *param* vector.

?scal

Computes the product of a vector by a scalar.

Syntax

call sscal(*n*, *a*, *x*, *incx*)

call dscal(*n*, *a*, *x*, *incx*)

```
call cscal(n, a, x, incx)
call zscal(n, a, x, incx)
call csscal(n, a, x, incx)
call zdscal(n, a, x, incx)
call scal(x, a)
```

Include Files

- mkl.fi, blas.f90

Description

The ?scal routines perform a vector operation defined as

```
x = a*x
```

where:

a is a scalar, *x* is an *n*-element vector.

Input Parameters

<i>n</i>	INTEGER. Specifies the number of elements in vector <i>x</i> .
<i>a</i>	REAL for sscal and csscal DOUBLE PRECISION for dscal and zdscal COMPLEX for cscal DOUBLE COMPLEX for zscal Specifies the scalar <i>a</i> .
<i>x</i>	REAL for sscal DOUBLE PRECISION for dscal COMPLEX for cscal and csscal DOUBLE COMPLEX for zscal and zdscal Array, size at least $(1 + (n - 1) * \text{abs}(\text{incx}))$.
<i>incx</i>	INTEGER. Specifies the increment for the elements of <i>x</i> .

Output Parameters

<i>x</i>	Updated vector <i>x</i> .
----------	---------------------------

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine `scal` interface are the following:

<i>x</i>	Holds the vector with the number of elements <i>n</i> .
----------	---

?swap*Swaps a vector with another vector.***Syntax**

```
call sswap(n, x, incx, y, incy)
call dswap(n, x, incx, y, incy)
call cswap(n, x, incx, y, incy)
call zswap(n, x, incx, y, incy)
call swap(x, y)
```

Include Files

- `mkl.fi`, `blas.f90`

Description

Given two vectors *x* and *y*, the ?swap routines return vectors *y* and *x* swapped, each replacing the other.

Input Parameters

<i>n</i>	INTEGER. Specifies the number of elements in vectors <i>x</i> and <i>y</i> .
<i>x</i>	REAL for sswap DOUBLE PRECISION for dswap COMPLEX for cswap DOUBLE COMPLEX for zswap Array, size at least $(1 + (n-1) * \text{abs}(\text{incx}))$.
<i>incx</i>	INTEGER. Specifies the increment for the elements of <i>x</i> .
<i>y</i>	REAL for sswap DOUBLE PRECISION for dswap COMPLEX for cswap DOUBLE COMPLEX for zswap Array, size at least $(1 + (n-1) * \text{abs}(\text{incy}))$.
<i>incy</i>	INTEGER. Specifies the increment for the elements of <i>y</i> .

Output Parameters

<i>x</i>	Contains the resultant vector <i>x</i> , that is, the input vector <i>y</i> .
<i>y</i>	Contains the resultant vector <i>y</i> , that is, the input vector <i>x</i> .

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine `swap` interface are the following:

x	Holds the vector with the number of elements n .
y	Holds the vector with the number of elements n .

i?amax

Finds the index of the element with maximum absolute value.

Syntax

```
index = isamax(n, x, incx)
index = idamax(n, x, incx)
index = icamax(n, x, incx)
index = izamax(n, x, incx)
index = iamax(x)
```

Include Files

- mkl.fi, blas.f90

Description

Given a vector x , the `i?amax` functions return the position of the vector element $x(i)$ that has the largest absolute value for real flavors, or the largest sum $|\operatorname{Re}(x(i))| + |\operatorname{Im}(x(i))|$ for complex flavors.

If n is not positive, 0 is returned.

If more than one vector element is found with the same largest absolute value, the index of the first one encountered is returned.

Input Parameters

n	INTEGER. Specifies the number of elements in vector x .
x	REAL for <code>isamax</code> DOUBLE PRECISION for <code>idamax</code> COMPLEX for <code>icamax</code> DOUBLE COMPLEX for <code>izamax</code> Array, size at least $(1 + (n-1) * \operatorname{abs}(incx))$.
$incx$	INTEGER. Specifies the increment for the elements of x .

Output Parameters

$index$	INTEGER. Contains the position of vector element that has the largest absolute value such that $x(index)$ has the largest absolute value.
---------	---

BLAS 95 Interface Notes

Functions and routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the function `iamax` interface are the following:

x Holds the vector with the number of elements n .

i?amin

Finds the index of the element with the smallest absolute value.

Syntax

```
index = isamin(n, x, incx)
index = idamin(n, x, incx)
index = icamin(n, x, incx)
index = izamin(n, x, incx)
index = iamin(x)
```

Include Files

- mkl.fi, blas.f90

Description

Given a vector x , the `i?amin` functions return the position of the vector element $x(i)$ that has the smallest absolute value for real flavors, or the smallest sum $|\operatorname{Re}(x(i))| + |\operatorname{Im}(x(i))|$ for complex flavors.

If n is not positive, 0 is returned.

If more than one vector element is found with the same smallest absolute value, the index of the first one encountered is returned.

Input Parameters

n	INTEGER. On entry, n specifies the number of elements in vector x .
x	REAL for <code>isamin</code> DOUBLE PRECISION for <code>idamin</code> COMPLEX for <code>icamin</code> DOUBLE COMPLEX for <code>izamin</code> Array, size at least $(1 + (n-1) * \operatorname{abs}(incx))$.
$incx$	INTEGER. Specifies the increment for the elements of x .

Output Parameters

$index$	INTEGER. Indicates the position of vector element with the smallest absolute value such that $x(index)$ has the smallest absolute value.
---------	--

BLAS 95 Interface Notes

Functions and routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the function `iamin` interface are the following:

x Holds the vector with the number of elements n .

?cabs1

Computes absolute value of complex number.

Syntax

```
res = scabs1(z)
```

```
res = dcabs1(z)
```

```
res = cabs1(z)
```

Include Files

- mkl.fi, blas.f90

Description

The ?cabs1 is an auxiliary routine for a few BLAS Level 1 routines. This routine performs an operation defined as

```
res = |Re(z)| + |Im(z)|,
```

where z is a scalar, and res is a value containing the absolute value of a complex number z .

Input Parameters

z COMPLEX scalar for scabs1.
DOUBLE COMPLEX scalar for dcabs1.

Output Parameters

res REAL for scabs1.
DOUBLE PRECISION for dcabs1.
Contains the absolute value of a complex number z .

BLAS Level 2 Routines

This section describes BLAS Level 2 routines, which perform matrix-vector operations. [Table "BLAS Level 2 Routine Groups and Their Data Types"](#) lists the BLAS Level 2 routine groups and the data types associated with them.

BLAS Level 2 Routine Groups and Their Data Types

Routine Groups	Data Types	Description
?gbmv	s, d, c, z	Matrix-vector product using a general band matrix
?gemv	s, d, c, z	Matrix-vector product using a general matrix
?ger	s, d	Rank-1 update of a general matrix
?gerc	c, z	Rank-1 update of a conjugated general matrix
?geru	c, z	Rank-1 update of a general matrix, unconjugated
?hbmV	c, z	Matrix-vector product using a Hermitian band matrix

Routine Groups	Data Types	Description
?hemv	c, z	Matrix-vector product using a Hermitian matrix
?her	c, z	Rank-1 update of a Hermitian matrix
?her2	c, z	Rank-2 update of a Hermitian matrix
?hpmv	c, z	Matrix-vector product using a Hermitian packed matrix
?hpr	c, z	Rank-1 update of a Hermitian packed matrix
?hpr2	c, z	Rank-2 update of a Hermitian packed matrix
?sbmv	s, d	Matrix-vector product using symmetric band matrix
?spmv	s, d	Matrix-vector product using a symmetric packed matrix
?spr	s, d	Rank-1 update of a symmetric packed matrix
?spr2	s, d	Rank-2 update of a symmetric packed matrix
?symv	s, d	Matrix-vector product using a symmetric matrix
?syr	s, d	Rank-1 update of a symmetric matrix
?syr2	s, d	Rank-2 update of a symmetric matrix
?tbmv	s, d, c, z	Matrix-vector product using a triangular band matrix
?tbsv	s, d, c, z	Solution of a linear system of equations with a triangular band matrix
?tpmv	s, d, c, z	Matrix-vector product using a triangular packed matrix
?tpsv	s, d, c, z	Solution of a linear system of equations with a triangular packed matrix
?trmv	s, d, c, z	Matrix-vector product using a triangular matrix
?trsv	s, d, c, z	Solution of a linear system of equations with a triangular matrix

[?gbmv](#)

Computes a matrix-vector product using a general band matrix

Syntax

```
call sgbmv(trans, m, n, kl, ku, alpha, a, lda, x, incx, beta, y, incy)
call dgbmv(trans, m, n, kl, ku, alpha, a, lda, x, incx, beta, y, incy)
call cgbmv(trans, m, n, kl, ku, alpha, a, lda, x, incx, beta, y, incy)
call zgbmv(trans, m, n, kl, ku, alpha, a, lda, x, incx, beta, y, incy)
call gbm(a, x, y [,kl] [,m] [,alpha] [,beta] [,trans])
```

Include Files

- `mkl.fi, blas.f90`

Description

The `?gbmv` routines perform a matrix-vector operation defined as

$y := \alpha * A * x + \beta * y,$

or

$y := \alpha * A' * x + \beta * y,$

or

$y := \alpha * \text{conjg}(A') * x + \beta * y,$

where:

α and β are scalars,

x and y are vectors,

A is an m -by- n band matrix, with kl sub-diagonals and ku super-diagonals.

Input Parameters

<i>trans</i>	<p>CHARACTER*1. Specifies the operation:</p> <p>If <i>trans</i>= 'N' or 'n', then $y := \alpha * A * x + \beta * y$</p> <p>If <i>trans</i>= 'T' or 't', then $y := \alpha * A' * x + \beta * y$</p> <p>If <i>trans</i>= 'C' or 'c', then $y := \alpha * \text{conjg}(A') * x + \beta * y$</p>
<i>m</i>	<p>INTEGER. Specifies the number of rows of the matrix A.</p> <p>The value of m must be at least zero.</p>
<i>n</i>	<p>INTEGER. Specifies the number of columns of the matrix A.</p> <p>The value of n must be at least zero.</p>
<i>kl</i>	<p>INTEGER. Specifies the number of sub-diagonals of the matrix A.</p> <p>The value of kl must satisfy $0 \leq kl$.</p>
<i>ku</i>	<p>INTEGER. Specifies the number of super-diagonals of the matrix A.</p> <p>The value of ku must satisfy $0 \leq ku$.</p>
<i>alpha</i>	<p>REAL for sgbmv</p> <p>DOUBLE PRECISION for dgbmv</p> <p>COMPLEX for cgbmv</p> <p>DOUBLE COMPLEX for zgbmv</p> <p>Specifies the scalar α.</p>
<i>a</i>	<p>REAL for sgbmv</p> <p>DOUBLE PRECISION for dgbmv</p> <p>COMPLEX for cgbmv</p> <p>DOUBLE COMPLEX for zgbmv</p> <p>Array, size (lda, n).</p> <p>Before entry, the leading $(kl + ku + 1)$ by n part of the array a must contain the matrix of coefficients. This matrix must be supplied column-by-column, with the leading diagonal of the matrix in row $(ku + 1)$ of the array, the first super-diagonal starting at position 2 in row ku, the first sub-</p>

diagonal starting at position 1 in row $(ku + 2)$, and so on. Elements in the array a that do not correspond to elements in the band matrix (such as the top left ku by ku triangle) are not referenced.

The following program segment transfers a band matrix from conventional full matrix storage (*matrix*) to band storage (*a*):

```

      do 20, j = 1, n
        k = ku + 1 - j
        do 10, i = max(1, j-ku), min(m, j+kl)
          a(k+i, j) = matrix(i,j)
10      continue
20      continue

```

lda INTEGER. Specifies the leading dimension of a as declared in the calling (sub)program. The value of *lda* must be at least $(kl + ku + 1)$.

x REAL for sgbmv
 DOUBLE PRECISION for dgbmv
 COMPLEX for cgbmv
 DOUBLE COMPLEX for zgbmv
 Array, size at least $(1 + (n - 1) * \text{abs}(\text{incx}))$ when *trans* = 'N' or 'n', and at least $(1 + (m - 1) * \text{abs}(\text{incx}))$ otherwise. Before entry, the array x must contain the vector x .

incx INTEGER. Specifies the increment for the elements of x . *incx* must not be zero.

beta REAL for sgbmv
 DOUBLE PRECISION for dgbmv
 COMPLEX for cgbmv
 DOUBLE COMPLEX for zgbmv
 Specifies the scalar beta. When *beta* is equal to zero, then y need not be set on input.

y REAL for sgbmv
 DOUBLE PRECISION for dgbmv
 COMPLEX for cgbmv
 DOUBLE COMPLEX for zgbmv
 Array, size at least $(1 + (m - 1) * \text{abs}(\text{incy}))$ when *trans* = 'N' or 'n' and at least $(1 + (n - 1) * \text{abs}(\text{incy}))$ otherwise. Before entry, the incremented array y must contain the vector y .

incy INTEGER. Specifies the increment for the elements of y .
 The value of *incy* must not be zero.

Output Parameters

y Updated vector y .

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine `gbmv` interface are the following:

<i>a</i>	Holds the array <i>a</i> of size $(kl+ku+1, n)$. Contains a banded matrix $m*n$ with <i>kl</i> lower diagonal and <i>ku</i> upper diagonal.
<i>x</i>	Holds the vector with the number of elements <i>rx</i> , where $rx = n$ if <i>trans</i> = 'N', $rx = m$ otherwise.
<i>y</i>	Holds the vector with the number of elements <i>ry</i> , where $ry = m$ if <i>trans</i> = 'N', $ry = n$ otherwise.
<i>trans</i>	Must be 'N', 'C', or 'T'. The default value is 'N'.
<i>kl</i>	If omitted, assumed $kl = ku$, that is, the number of lower diagonals equals the number of the upper diagonals.
<i>ku</i>	Restored as $ku = lda - kl - 1$, where <i>lda</i> is the leading dimension of matrix <i>A</i> .
<i>m</i>	If omitted, assumed $m = n$, that is, a square matrix.
<i>alpha</i>	The default value is 1.
<i>beta</i>	The default value is 0.

?gemv

Computes a matrix-vector product using a general matrix

Syntax

```
call sgemv(trans, m, n, alpha, a, lda, x, incx, beta, y, incy)
call dgemv(trans, m, n, alpha, a, lda, x, incx, beta, y, incy)
call cgemv(trans, m, n, alpha, a, lda, x, incx, beta, y, incy)
call zgemv(trans, m, n, alpha, a, lda, x, incx, beta, y, incy)
call scgemv(trans, m, n, alpha, a, lda, x, incx, beta, y, incy)
call dzgemv(trans, m, n, alpha, a, lda, x, incx, beta, y, incy)
call gemv(a, x, y [,alpha][,beta] [,trans])
```

Include Files

- `mkl.fi`, `blas.f90`

Description

The `?gemv` routines perform a matrix-vector operation defined as

$y := \alpha A x + \beta y$,

or

$y := \alpha * A' * x + \beta * y,$

or

$y := \alpha * \text{conjg}(A') * x + \beta * y,$

where:

α and β are scalars,

x and y are vectors,

A is an m -by- n matrix.

Input Parameters

<i>trans</i>	<p>CHARACTER*1. Specifies the operation:</p> <p>if <i>trans</i>= 'N' or 'n', then $y := \alpha * A * x + \beta * y;$</p> <p>if <i>trans</i>= 'T' or 't', then $y := \alpha * A' * x + \beta * y;$</p> <p>if <i>trans</i>= 'C' or 'c', then $y := \alpha * \text{conjg}(A') * x + \beta * y.$</p>
<i>m</i>	<p>INTEGER. Specifies the number of rows of the matrix A. The value of m must be at least zero.</p>
<i>n</i>	<p>INTEGER. Specifies the number of columns of the matrix A. The value of n must be at least zero.</p>
<i>alpha</i>	<p>REAL for sgemv</p> <p>DOUBLE PRECISION for dgemv</p> <p>COMPLEX for cgemv, scgemv</p> <p>DOUBLE COMPLEX for zgemv, dzgemv</p> <p>Specifies the scalar α.</p>
<i>a</i>	<p>REAL for sgemv, scgemv</p> <p>DOUBLE PRECISION for dgemv, dzgemv</p> <p>COMPLEX for cgemv</p> <p>DOUBLE COMPLEX for zgemv</p> <p>Array, size (lda, n).</p> <p>Before entry, the leading m-by-n part of the array a must contain the matrix of coefficients.</p>
<i>lda</i>	<p>INTEGER. Specifies the leading dimension of a as declared in the calling (sub)program.</p> <p>The value of lda must be at least $\max(1, m)$.</p>
<i>x</i>	<p>REAL for sgemv</p> <p>DOUBLE PRECISION for dgemv</p> <p>COMPLEX for cgemv, scgemv</p> <p>DOUBLE COMPLEX for zgemv, dzgemv</p>

Array, size at least $(1 + (n-1) * \text{abs}(\text{incx}))$ when $\text{trans} = \text{'N'}$ or 'n' and at least $(1 + (m - 1) * \text{abs}(\text{incx}))$ otherwise. Before entry, the incremented array x must contain the vector x .

incx INTEGER. Specifies the increment for the elements of x .

The value of *incx* must not be zero.

beta REAL for *sgemv*
DOUBLE PRECISION for *dgemv*
COMPLEX for *cgemv*, *scgemv*
DOUBLE COMPLEX for *zgemv*, *dzgemv*

Specifies the scalar *beta*. When *beta* is set to zero, then y need not be set on input.

y REAL for *sgemv*
DOUBLE PRECISION for *dgemv*
COMPLEX for *cgemv*, *scgemv*
DOUBLE COMPLEX for *zgemv*, *dzgemv*

Array, size at least $(1 + (m - 1) * \text{abs}(\text{incy}))$ when $\text{trans} = \text{'N'}$ or 'n' and at least $(1 + (n - 1) * \text{abs}(\text{incy}))$ otherwise. Before entry with non-zero *beta*, the incremented array y must contain the vector y .

incy INTEGER. Specifies the increment for the elements of y .
The value of *incy* must not be zero.

Output Parameters

y Updated vector y .

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine *gemv* interface are the following:

a Holds the matrix A of size (m,n) .

x Holds the vector with the number of elements rx where $rx = n$ if $\text{trans} = \text{'N'}$, $rx = m$ otherwise.

y Holds the vector with the number of elements ry where $ry = m$ if $\text{trans} = \text{'N'}$, $ry = n$ otherwise.

trans Must be 'N' , 'C' , or 'T' .
The default value is 'N' .

alpha The default value is 1.

beta The default value is 0.

?ger

Performs a rank-1 update of a general matrix.

Syntax

```
call sger(m, n, alpha, x, incx, y, incy, a, lda)
call dger(m, n, alpha, x, incx, y, incy, a, lda)
call ger(a, x, y [,alpha])
```

Include Files

- mkl.fi, blas.f90

Description

The ?ger routines perform a matrix-vector operation defined as

$$A := \alpha x y^T + A,$$

where:

α is a scalar,

x is an m -element vector,

y is an n -element vector,

A is an m -by- n general matrix.

Input Parameters

m	<p>INTEGER. Specifies the number of rows of the matrix A.</p> <p>The value of m must be at least zero.</p>
n	<p>INTEGER. Specifies the number of columns of the matrix A.</p> <p>The value of n must be at least zero.</p>
α	<p>REAL for sger</p> <p>DOUBLE PRECISION for dger</p> <p>Specifies the scalar α.</p>
x	<p>REAL for sger</p> <p>DOUBLE PRECISION for dger</p> <p>Array, size at least $(1 + (m - 1) * \text{abs}(\text{incx}))$. Before entry, the incremented array x must contain the m-element vector x.</p>
incx	<p>INTEGER. Specifies the increment for the elements of x.</p> <p>The value of incx must not be zero.</p>
y	<p>REAL for sger</p> <p>DOUBLE PRECISION for dger</p> <p>Array, size at least $(1 + (n - 1) * \text{abs}(\text{incy}))$. Before entry, the incremented array y must contain the n-element vector y.</p>

<i>incy</i>	INTEGER. Specifies the increment for the elements of <i>y</i> . The value of <i>incy</i> must not be zero.
<i>a</i>	REAL for <i>sger</i> DOUBLE PRECISION for <i>dger</i> Array, size (<i>lda</i> , <i>n</i>). Before entry, the leading <i>m</i> -by- <i>n</i> part of the array <i>a</i> must contain the matrix of coefficients.
<i>lda</i>	INTEGER. Specifies the leading dimension of <i>a</i> as declared in the calling (sub)program. The value of <i>lda</i> must be at least $\max(1, m)$.

Output Parameters

<i>a</i>	Overwritten by the updated matrix.
----------	------------------------------------

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine *ger* interface are the following:

<i>a</i>	Holds the matrix <i>A</i> of size (<i>m</i> , <i>n</i>).
<i>x</i>	Holds the vector with the number of elements <i>m</i> .
<i>y</i>	Holds the vector with the number of elements <i>n</i> .
<i>alpha</i>	The default value is 1.

?gerc

Performs a rank-1 update (conjugated) of a general matrix.

Syntax

```
call cgerc(m, n, alpha, x, incx, y, incy, a, lda)
call zgerc(m, n, alpha, x, incx, y, incy, a, lda)
call gerc(a, x, y [,alpha])
```

Include Files

- `mkl.fi`, `blas.f90`

Description

The *?gerc* routines perform a matrix-vector operation defined as

$$A := \alpha x \text{conjg}(y') + A,$$

where:

alpha is a scalar,

x is an m -element vector,
 y is an n -element vector,
 A is an m -by- n matrix.

Input Parameters

m	<p>INTEGER. Specifies the number of rows of the matrix A.</p> <p>The value of m must be at least zero.</p>
n	<p>INTEGER. Specifies the number of columns of the matrix A.</p> <p>The value of n must be at least zero.</p>
$alpha$	<p>COMPLEX for cgerc</p> <p>DOUBLE COMPLEX for zgerc</p> <p>Specifies the scalar $alpha$.</p>
x	<p>COMPLEX for cgerc</p> <p>DOUBLE COMPLEX for zgerc</p> <p>Array, size at least $(1 + (m - 1) * abs(incx))$. Before entry, the incremented array x must contain the m-element vector x.</p>
$incx$	<p>INTEGER. Specifies the increment for the elements of x.</p> <p>The value of $incx$ must not be zero.</p>
y	<p>COMPLEX for cgerc</p> <p>DOUBLE COMPLEX for zgerc</p> <p>Array, size at least $(1 + (n - 1) * abs(incy))$. Before entry, the incremented array y must contain the n-element vector y.</p>
$incy$	<p>INTEGER. Specifies the increment for the elements of y.</p> <p>The value of $incy$ must not be zero.</p>
a	<p>COMPLEX for cgerc</p> <p>DOUBLE COMPLEX for zgerc</p> <p>Array, size (lda, n).</p> <p>Before entry, the leading m-by-n part of the array a must contain the matrix of coefficients.</p>
lda	<p>INTEGER. Specifies the leading dimension of a as declared in the calling (sub)program.</p> <p>The value of lda must be at least $\max(1, m)$.</p>

Output Parameters

a	Overwritten by the updated matrix.
-----	------------------------------------

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine `gerc` interface are the following:

<i>a</i>	Holds the matrix <i>A</i> of size (m,n) .
<i>x</i>	Holds the vector with the number of elements <i>m</i> .
<i>y</i>	Holds the vector with the number of elements <i>n</i> .
<i>alpha</i>	The default value is 1.

?geru

Performs a rank-1 update (unconjugated) of a general matrix.

Syntax

```
call cgeru(m, n, alpha, x, incx, y, incy, a, lda)
call zgeru(m, n, alpha, x, incx, y, incy, a, lda)
call geru(a, x, y [,alpha])
```

Include Files

- `mkl.fi`, `blas.f90`

Description

The `?geru` routines perform a matrix-vector operation defined as

$$A := \alpha x y^T + A,$$

where:

alpha is a scalar,
x is an *m*-element vector,
y is an *n*-element vector,
A is an *m*-by-*n* matrix.

Input Parameters

<i>m</i>	INTEGER. Specifies the number of rows of the matrix <i>A</i> . The value of <i>m</i> must be at least zero.
<i>n</i>	INTEGER. Specifies the number of columns of the matrix <i>A</i> . The value of <i>n</i> must be at least zero.
<i>alpha</i>	COMPLEX for <code>cgeru</code> DOUBLE COMPLEX for <code>zgeru</code> Specifies the scalar <i>alpha</i> .

<i>x</i>	<p>COMPLEX for <code>cgeru</code></p> <p>DOUBLE COMPLEX for <code>zgeru</code></p> <p>Array, size at least $(1 + (m - 1) * \text{abs}(\text{incx}))$. Before entry, the incremented array <i>x</i> must contain the <i>m</i>-element vector <i>x</i>.</p>
<i>incx</i>	<p>INTEGER. Specifies the increment for the elements of <i>x</i>.</p> <p>The value of <i>incx</i> must not be zero.</p>
<i>y</i>	<p>COMPLEX for <code>cgeru</code></p> <p>DOUBLE COMPLEX for <code>zgeru</code></p> <p>Array, size at least $(1 + (n - 1) * \text{abs}(\text{incy}))$. Before entry, the incremented array <i>y</i> must contain the <i>n</i>-element vector <i>y</i>.</p>
<i>incy</i>	<p>INTEGER. Specifies the increment for the elements of <i>y</i>.</p> <p>The value of <i>incy</i> must not be zero.</p>
<i>a</i>	<p>COMPLEX for <code>cgeru</code></p> <p>DOUBLE COMPLEX for <code>zgeru</code></p> <p>Array, size (lda, n).</p> <p>Before entry, the leading <i>m</i>-by-<i>n</i> part of the array <i>a</i> must contain the matrix of coefficients.</p>
<i>lda</i>	<p>INTEGER. Specifies the leading dimension of <i>a</i> as declared in the calling (sub)program.</p> <p>The value of <i>lda</i> must be at least $\max(1, m)$.</p>

Output Parameters

<i>a</i>	Overwritten by the updated matrix.
----------	------------------------------------

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine `geru` interface are the following:

<i>a</i>	Holds the matrix <i>A</i> of size (m,n) .
<i>x</i>	Holds the vector with the number of elements <i>m</i> .
<i>y</i>	Holds the vector with the number of elements <i>n</i> .
<i>alpha</i>	The default value is 1.

?hbmV

Computes a matrix-vector product using a Hermitian band matrix.

Syntax

```
call chbmvm(uplo, n, k, alpha, a, lda, x, incx, beta, y, incy)
call zhbmv(uplo, n, k, alpha, a, lda, x, incx, beta, y, incy)
call hbmvm(a, x, y [,uplo][,alpha][,beta])
```

Include Files

- mkl.fi, blas.f90

Description

The ?hbmvm routines perform a matrix-vector operation defined as $y := \alpha A x + \beta y$, where:

α and β are scalars,

x and y are n -element vectors,

A is an n -by- n Hermitian band matrix, with k super-diagonals.

Input Parameters

<i>uplo</i>	<p>CHARACTER*1. Specifies whether the upper or lower triangular part of the Hermitian band matrix A is used:</p> <p>If <i>uplo</i> = 'U' or 'u', then the upper triangular part of the matrix A is used.</p> <p>If <i>uplo</i> = 'L' or 'l', then the low triangular part of the matrix A is used.</p>
<i>n</i>	<p>INTEGER. Specifies the order of the matrix A. The value of n must be at least zero.</p>
<i>k</i>	<p>INTEGER. For <i>uplo</i> = 'U' or 'u' Specifies the number of super-diagonals of the matrix A.</p> <p>For <i>uplo</i> = 'L' or 'l': Specifies the number of sub-diagonals of the matrix A.</p> <p>The value of k must satisfy $0 \leq k$.</p>
<i>alpha</i>	<p>COMPLEX for chbmvm</p> <p>DOUBLE COMPLEX for zhbmv</p> <p>Specifies the scalar α.</p>
<i>a</i>	<p>COMPLEX for chbmvm</p> <p>DOUBLE COMPLEX for zhbmv</p> <p>Array, size (<i>lda</i>, <i>n</i>).</p> <p>Before entry with <i>uplo</i> = 'U' or 'u', the leading $(k + 1)$ by n part of the array a must contain the upper triangular band part of the Hermitian matrix. The matrix must be supplied column-by-column, with the leading diagonal of the matrix in row $(k + 1)$ of the array, the first super-diagonal starting at position 2 in row k, and so on. The top left k by k triangle of the array a is not referenced.</p>

The following program segment transfers the upper triangular part of a Hermitian band matrix from conventional full matrix storage (*matrix*) to band storage (*a*):

```

      do 20, j = 1, n
        m = k + 1 - j
        do 10, i = max( 1, j - k ), j
          a( m + i, j ) = matrix( i, j )
10      continue
20      continue

```

Before entry with *uplo* = 'L' or 'l', the leading $(k + 1)$ by n part of the array *a* must contain the lower triangular band part of the Hermitian matrix, supplied column-by-column, with the leading diagonal of the matrix in row 1 of the array, the first sub-diagonal starting at position 1 in row 2, and so on. The bottom right k by k triangle of the array *a* is not referenced.

The following program segment transfers the lower triangular part of a Hermitian band matrix from conventional full matrix storage (*matrix*) to band storage (*a*):

```

      do 20, j = 1, n
        m = 1 - j
        do 10, i = j, min( n, j + k )
          a( m + i, j ) = matrix( i, j )
10      continue
20      continue

```

The imaginary parts of the diagonal elements need not be set and are assumed to be zero.

lda INTEGER. Specifies the leading dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least $(k + 1)$.

x COMPLEX for *chbmv*
 DOUBLE COMPLEX for *zhbmv*
 Array, size at least $(1 + (n - 1) * \text{abs}(\text{incx}))$. Before entry, the incremented array *x* must contain the vector *x*.

incx INTEGER. Specifies the increment for the elements of *x*.
 The value of *incx* must not be zero.

beta COMPLEX for *chbmv*
 DOUBLE COMPLEX for *zhbmv*
 Specifies the scalar *beta*.

y COMPLEX for *chbmv*
 DOUBLE COMPLEX for *zhbmv*
 Array, size at least $(1 + (n - 1) * \text{abs}(\text{incy}))$. Before entry, the incremented array *y* must contain the vector *y*.

incy INTEGER. Specifies the increment for the elements of *y*.
 The value of *incy* must not be zero.

Output Parameters

y Overwritten by the updated vector *y*.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine `hemv` interface are the following:

<i>a</i>	Holds the array <i>a</i> of size $(k+1,n)$.
<i>x</i>	Holds the vector with the number of elements <i>n</i> .
<i>y</i>	Holds the vector with the number of elements <i>n</i> .
<i>uplo</i>	Must be 'U' or 'L'. The default value is 'U'.
<i>alpha</i>	The default value is 1.
<i>beta</i>	The default value is 0.

?hemv

Computes a matrix-vector product using a Hermitian matrix.

Syntax

```
call chemv(uplo, n, alpha, a, lda, x, incx, beta, y, incy)
call zhemv(uplo, n, alpha, a, lda, x, incx, beta, y, incy)
call hemv(a, x, y [,uplo][,alpha] [,beta])
```

Include Files

- `mkl.fi, blas.f90`

Description

The `?hemv` routines perform a matrix-vector operation defined as

```
y := alpha*A*x + beta*y,
```

where:

alpha and *beta* are scalars,

x and *y* are *n*-element vectors,

A is an *n*-by-*n* Hermitian matrix.

Input Parameters

uplo CHARACTER*1. Specifies whether the upper or lower triangular part of the array *a* is used.

If *uplo* = 'U' or 'u', then the upper triangular of the array *a* is used.

If *uplo* = 'L' or 'l', then the low triangular of the array *a* is used.

<i>n</i>	INTEGER. Specifies the order of the matrix <i>A</i> . The value of <i>n</i> must be at least zero.
<i>alpha</i>	COMPLEX for chemv DOUBLE COMPLEX for zhemv Specifies the scalar <i>alpha</i> .
<i>a</i>	COMPLEX for chemv DOUBLE COMPLEX for zhemv Array, size (<i>lda</i> , <i>n</i>). Before entry with <i>uplo</i> = 'U' or 'u', the leading <i>n</i> -by- <i>n</i> upper triangular part of the array <i>a</i> must contain the upper triangular part of the Hermitian matrix and the strictly lower triangular part of <i>a</i> is not referenced. Before entry with <i>uplo</i> = 'L' or 'l', the leading <i>n</i> -by- <i>n</i> lower triangular part of the array <i>a</i> must contain the lower triangular part of the Hermitian matrix and the strictly upper triangular part of <i>a</i> is not referenced. The imaginary parts of the diagonal elements need not be set and are assumed to be zero.
<i>lda</i>	INTEGER. Specifies the leading dimension of <i>a</i> as declared in the calling (sub)program. The value of <i>lda</i> must be at least $\max(1, n)$.
<i>x</i>	COMPLEX for chemv DOUBLE COMPLEX for zhemv Array, size at least $(1 + (n - 1) * \text{abs}(\text{incx}))$. Before entry, the incremented array <i>x</i> must contain the <i>n</i> -element vector <i>x</i> .
<i>incx</i>	INTEGER. Specifies the increment for the elements of <i>x</i> . The value of <i>incx</i> must not be zero.
<i>beta</i>	COMPLEX for chemv DOUBLE COMPLEX for zhemv Specifies the scalar <i>beta</i> . When <i>beta</i> is supplied as zero then <i>y</i> need not be set on input.
<i>y</i>	COMPLEX for chemv DOUBLE COMPLEX for zhemv Array, size at least $(1 + (n - 1) * \text{abs}(\text{incy}))$. Before entry, the incremented array <i>y</i> must contain the <i>n</i> -element vector <i>y</i> .
<i>incy</i>	INTEGER. Specifies the increment for the elements of <i>y</i> . The value of <i>incy</i> must not be zero.

Output Parameters

<i>y</i>	Overwritten by the updated vector <i>y</i> .
----------	--

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine `hemv` interface are the following:

<code>a</code>	Holds the matrix A of size (n,n) .
<code>x</code>	Holds the vector with the number of elements n .
<code>y</code>	Holds the vector with the number of elements n .
<code>uplo</code>	Must be 'U' or 'L'. The default value is 'U'.
<code>alpha</code>	The default value is 1.
<code>beta</code>	The default value is 0.

?her

Performs a rank-1 update of a Hermitian matrix.

Syntax

```
call cher(uplo, n, alpha, x, incx, a, lda)
call zher(uplo, n, alpha, x, incx, a, lda)
call her(a, x [,uplo] [, alpha])
```

Include Files

- `mkl.fi`, `blas.f90`

Description

The `?her` routines perform a matrix-vector operation defined as

$$A := \alpha x \text{conjg}(x') + A,$$

where:

α is a real scalar,

x is an n -element vector,

A is an n -by- n Hermitian matrix.

Input Parameters

<code>uplo</code>	CHARACTER*1. Specifies whether the upper or lower triangular part of the array a is used. If <code>uplo</code> = 'U' or 'u', then the upper triangular of the array a is used. If <code>uplo</code> = 'L' or 'l', then the low triangular of the array a is used.
<code>n</code>	INTEGER. Specifies the order of the matrix A . The value of n must be at least zero.
<code>alpha</code>	REAL for <code>cher</code>

	DOUBLE PRECISION for <code>zher</code> Specifies the scalar <i>alpha</i> .
<i>x</i>	COMPLEX for <code>cher</code> DOUBLE COMPLEX for <code>zher</code> Array, dimension at least $(1 + (n - 1) * \text{abs}(\text{incx}))$. Before entry, the incremented array <i>x</i> must contain the <i>n</i> -element vector <i>x</i> .
<i>incx</i>	INTEGER. Specifies the increment for the elements of <i>x</i> . The value of <i>incx</i> must not be zero.
<i>a</i>	COMPLEX for <code>cher</code> DOUBLE COMPLEX for <code>zher</code> Array, size (lda, n) . Before entry with <i>uplo</i> = 'U' or 'u', the leading <i>n</i> -by- <i>n</i> upper triangular part of the array <i>a</i> must contain the upper triangular part of the Hermitian matrix and the strictly lower triangular part of <i>a</i> is not referenced. Before entry with <i>uplo</i> = 'L' or 'l', the leading <i>n</i> -by- <i>n</i> lower triangular part of the array <i>a</i> must contain the lower triangular part of the Hermitian matrix and the strictly upper triangular part of <i>a</i> is not referenced. The imaginary parts of the diagonal elements need not be set and are assumed to be zero.
<i>lda</i>	INTEGER. Specifies the leading dimension of <i>a</i> as declared in the calling (sub)program. The value of <i>lda</i> must be at least $\max(1, n)$.

Output Parameters

<i>a</i>	With <i>uplo</i> = 'U' or 'u', the upper triangular part of the array <i>a</i> is overwritten by the upper triangular part of the updated matrix. With <i>uplo</i> = 'L' or 'l', the lower triangular part of the array <i>a</i> is overwritten by the lower triangular part of the updated matrix. The imaginary parts of the diagonal elements are set to zero.
----------	---

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine `her` interface are the following:

<i>a</i>	Holds the matrix <i>A</i> of size (n,n) .
<i>x</i>	Holds the vector with the number of elements <i>n</i> .
<i>uplo</i>	Must be 'U' or 'L'. The default value is 'U'.
<i>alpha</i>	The default value is 1.

?her2

Performs a rank-2 update of a Hermitian matrix.

Syntax

```
call cher2(uplo, n, alpha, x, incx, y, incy, a, lda)
call zher2(uplo, n, alpha, x, incx, y, incy, a, lda)
call her2(a, x, y [,uplo][,alpha])
```

Include Files

- mkl.fi, blas.f90

Description

The ?her2 routines perform a matrix-vector operation defined as

$$A := \alpha * x * \text{conjg}(y') + \text{conjg}(\alpha) * y * \text{conjg}(x') + A,$$

where:

alpha is a scalar,

x and *y* are *n*-element vectors,

A is an *n*-by-*n* Hermitian matrix.

Input Parameters

<i>uplo</i>	<p>CHARACTER*1. Specifies whether the upper or lower triangular part of the array <i>a</i> is used.</p> <p>If <i>uplo</i> = 'U' or 'u', then the upper triangular of the array <i>a</i> is used.</p> <p>If <i>uplo</i> = 'L' or 'l', then the low triangular of the array <i>a</i> is used.</p>
<i>n</i>	<p>INTEGER. Specifies the order of the matrix <i>A</i>. The value of <i>n</i> must be at least zero.</p>
<i>alpha</i>	<p>COMPLEX for cher2</p> <p>DOUBLE COMPLEX for zher2</p> <p>Specifies the scalar <i>alpha</i>.</p>
<i>x</i>	<p>COMPLEX for cher2</p> <p>DOUBLE COMPLEX for zher2</p> <p>Array, size at least $(1 + (n - 1) * \text{abs}(\text{incx}))$. Before entry, the incremented array <i>x</i> must contain the <i>n</i>-element vector <i>x</i>.</p>

<i>y</i>	Holds the vector with the number of elements <i>n</i> .
<i>uplo</i>	Must be 'U' or 'L'. The default value is 'U'.
<i>alpha</i>	The default value is 1.

?hpmv

Computes a matrix-vector product using a Hermitian packed matrix.

Syntax

```
call chpmv(uplo, n, alpha, ap, x, incx, beta, y, incy)
call zhpmv(uplo, n, alpha, ap, x, incx, beta, y, incy)
```

```
call hpmv(ap, x, y [,uplo][,alpha][,beta])
```

Include Files

- mkl.fi, blas.f90

Description

The ?hpmv routines perform a matrix-vector operation defined as

```
y := alpha*A*x + beta*y,
```

where:

alpha and *beta* are scalars,

x and *y* are *n*-element vectors,

A is an *n*-by-*n* Hermitian matrix, supplied in packed form.

Input Parameters

<i>uplo</i>	<p>CHARACTER*1. Specifies whether the upper or lower triangular part of the matrix <i>A</i> is supplied in the packed array <i>ap</i>.</p> <p>If <i>uplo</i> = 'U' or 'u', then the upper triangular part of the matrix <i>A</i> is supplied in the packed array <i>ap</i>.</p> <p>If <i>uplo</i> = 'L' or 'l', then the low triangular part of the matrix <i>A</i> is supplied in the packed array <i>ap</i>.</p>
<i>n</i>	<p>INTEGER. Specifies the order of the matrix <i>A</i>. The value of <i>n</i> must be at least zero.</p>
<i>alpha</i>	<p>COMPLEX for chpmv</p> <p>DOUBLE COMPLEX for zhpmv</p> <p>Specifies the scalar <i>alpha</i>.</p>
<i>ap</i>	<p>COMPLEX for chpmv</p> <p>DOUBLE COMPLEX for zhpmv</p> <p>Array, size at least $((n*(n + 1))/2)$.</p> <p>Before entry with <i>uplo</i> = 'U' or 'u', the array <i>ap</i> must contain the upper triangular part of the Hermitian matrix packed sequentially, column-by-column, so that <i>ap</i>(1) contains $A_{1,1}$, <i>ap</i>(2) and <i>ap</i>(3) contain $A_{1,2}$ and $A_{2,2}$ respectively, and so on. Before entry with <i>uplo</i> = 'L' or 'l', the array <i>ap</i> must contain the lower triangular part of the Hermitian matrix packed sequentially, column-by-column, so that <i>ap</i>(1) contains $A_{1,1}$, <i>ap</i>(2) and <i>ap</i>(3) contain $A_{2,1}$ and $A_{3,1}$ respectively, and so on.</p> <p>The imaginary parts of the diagonal elements need not be set and are assumed to be zero.</p>
<i>x</i>	<p>COMPLEX for chpmv</p> <p>DOUBLE PRECISION COMPLEX for zhpmv</p> <p>Array, size at least $(1 + (n - 1)*abs(incx))$. Before entry, the incremented array <i>x</i> must contain the <i>n</i>-element vector <i>x</i>.</p>

<i>incx</i>	INTEGER. Specifies the increment for the elements of <i>x</i> . The value of <i>incx</i> must not be zero.
<i>beta</i>	COMPLEX for <i>chpmv</i> DOUBLE COMPLEX for <i>zhpmv</i> Specifies the scalar <i>beta</i> . When <i>beta</i> is equal to zero then <i>y</i> need not be set on input.
<i>y</i>	COMPLEX for <i>chpmv</i> DOUBLE COMPLEX for <i>zhpmv</i> Array, size at least $(1 + (n - 1) * \text{abs}(\text{incy}))$. Before entry, the incremented array <i>y</i> must contain the <i>n</i> -element vector <i>y</i> .
<i>incy</i>	INTEGER. Specifies the increment for the elements of <i>y</i> . The value of <i>incy</i> must not be zero.

Output Parameters

<i>y</i>	Overwritten by the updated vector <i>y</i> .
----------	--

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine *hpmv* interface are the following:

<i>ap</i>	Holds the array <i>ap</i> of size $(n*(n+1)/2)$.
<i>x</i>	Holds the vector with the number of elements <i>n</i> .
<i>y</i>	Holds the vector with the number of elements <i>n</i> .
<i>uplo</i>	Must be 'U' or 'L'. The default value is 'U'.
<i>alpha</i>	The default value is 1.
<i>beta</i>	The default value is 0.

?hpr

Performs a rank-1 update of a Hermitian packed matrix.

Syntax

```
call chpr(uplo, n, alpha, x, incx, ap)
call zhpr(uplo, n, alpha, x, incx, ap)
call hpr(ap, x [,uplo] [, alpha])
```

Include Files

- `mkl.fi`, `blas.f90`

Description

The `?hpr` routines perform a matrix-vector operation defined as

$$A := \alpha * x * \text{conjg}(x') + A,$$

where:

α is a real scalar,

x is an n -element vector,

A is an n -by- n Hermitian matrix, supplied in packed form.

Input Parameters

<i>uplo</i>	<p>CHARACTER*1. Specifies whether the upper or lower triangular part of the matrix A is supplied in the packed array ap.</p> <p>If <i>uplo</i> = 'U' or 'u', the upper triangular part of the matrix A is supplied in the packed array ap.</p> <p>If <i>uplo</i> = 'L' or 'l', the low triangular part of the matrix A is supplied in the packed array ap.</p>
<i>n</i>	<p>INTEGER. Specifies the order of the matrix A. The value of n must be at least zero.</p>
<i>alpha</i>	<p>REAL for <code>chpr</code></p> <p>DOUBLE PRECISION for <code>zhpr</code></p> <p>Specifies the scalar α.</p>
<i>x</i>	<p>COMPLEX for <code>chpr</code></p> <p>DOUBLE COMPLEX for <code>zhpr</code></p> <p>Array, size at least $(1 + (n - 1) * \text{abs}(\text{incx}))$. Before entry, the incremented array x must contain the n-element vector x.</p>
<i>incx</i>	<p>INTEGER. Specifies the increment for the elements of x. <i>incx</i> must not be zero.</p>
<i>ap</i>	<p>COMPLEX for <code>chpr</code></p> <p>DOUBLE COMPLEX for <code>zhpr</code></p> <p>Array, size at least $((n * (n + 1)) / 2)$.</p> <p>Before entry with <i>uplo</i> = 'U' or 'u', the array ap must contain the upper triangular part of the Hermitian matrix packed sequentially, column-by-column, so that $ap(1)$ contains $A_{1,1}$, $ap(2)$ and $ap(3)$ contain $A_{1,2}$ and $A_{2,2}$ respectively, and so on.</p> <p>Before entry with <i>uplo</i> = 'L' or 'l', the array ap must contain the lower triangular part of the Hermitian matrix packed sequentially, column-by-column, so that $ap(1)$ contains $A_{1,1}$, $ap(2)$ and $ap(3)$ contain $A_{2,1}$ and $A_{3,1}$ respectively, and so on.</p>

The imaginary parts of the diagonal elements need not be set and are assumed to be zero.

Output Parameters

ap With *uplo* = 'U' or 'u', overwritten by the upper triangular part of the updated matrix.
 With *uplo* = 'L' or 'l', overwritten by the lower triangular part of the updated matrix.
 The imaginary parts of the diagonal elements are set to zero.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine `hpr` interface are the following:

<i>ap</i>	Holds the array <i>ap</i> of size $(n*(n+1)/2)$.
<i>x</i>	Holds the vector with the number of elements <i>n</i> .
<i>uplo</i>	Must be 'U' or 'L'. The default value is 'U'.
<i>alpha</i>	The default value is 1.

?hpr2

Performs a rank-2 update of a Hermitian packed matrix.

Syntax

```
call chpr2(uplo, n, alpha, x, incx, y, incy, ap)
call zhpr2(uplo, n, alpha, x, incx, y, incy, ap)
call hpr2(ap, x, y [,uplo][,alpha])
```

Include Files

- `mkl.fi, blas.f90`

Description

The ?hpr2 routines perform a matrix-vector operation defined as

$$A := \alpha x \text{conjg}(y') + \text{conjg}(\alpha) y \text{conjg}(x') + A,$$

where:

alpha is a scalar,

x and *y* are *n*-element vectors,

A is an *n*-by-*n* Hermitian matrix, supplied in packed form.

Input Parameters

<i>uplo</i>	<p>CHARACTER*1. Specifies whether the upper or lower triangular part of the matrix <i>A</i> is supplied in the packed array <i>ap</i>.</p> <p>If <i>uplo</i> = 'U' or 'u', then the upper triangular part of the matrix <i>A</i> is supplied in the packed array <i>ap</i>.</p> <p>If <i>uplo</i> = 'L' or 'l', then the low triangular part of the matrix <i>A</i> is supplied in the packed array <i>ap</i>.</p>
<i>n</i>	<p>INTEGER. Specifies the order of the matrix <i>A</i>. The value of <i>n</i> must be at least zero.</p>
<i>alpha</i>	<p>COMPLEX for <i>chpr2</i></p> <p>DOUBLE COMPLEX for <i>zhpr2</i></p> <p>Specifies the scalar <i>alpha</i>.</p>
<i>x</i>	<p>COMPLEX for <i>chpr2</i></p> <p>DOUBLE COMPLEX for <i>zhpr2</i></p> <p>Array, dimension at least $(1 + (n - 1) * \text{abs}(\text{incx}))$. Before entry, the incremented array <i>x</i> must contain the <i>n</i>-element vector <i>x</i>.</p>
<i>incx</i>	<p>INTEGER. Specifies the increment for the elements of <i>x</i>.</p> <p>The value of <i>incx</i> must not be zero.</p>
<i>y</i>	<p>COMPLEX for <i>chpr2</i></p> <p>DOUBLE COMPLEX for <i>zhpr2</i></p> <p>Array, size at least $(1 + (n - 1) * \text{abs}(\text{incy}))$. Before entry, the incremented array <i>y</i> must contain the <i>n</i>-element vector <i>y</i>.</p>
<i>incy</i>	<p>INTEGER. Specifies the increment for the elements of <i>y</i>.</p> <p>The value of <i>incy</i> must not be zero.</p>
<i>ap</i>	<p>COMPLEX for <i>chpr2</i></p> <p>DOUBLE COMPLEX for <i>zhpr2</i></p> <p>Array, size at least $((n * (n + 1)) / 2)$.</p> <p>Before entry with <i>uplo</i> = 'U' or 'u', the array <i>ap</i> must contain the upper triangular part of the Hermitian matrix packed sequentially, column-by-column, so that <i>ap</i>(1) contains $A_{1,1}$, <i>ap</i>(2) and <i>ap</i>(3) contain $A_{1,2}$ and $A_{2,2}$ respectively, and so on.</p> <p>Before entry with <i>uplo</i> = 'L' or 'l', the array <i>ap</i> must contain the lower triangular part of the Hermitian matrix packed sequentially, column-by-column, so that <i>ap</i>(1) contains $A_{1,1}$, <i>ap</i>(2) and <i>ap</i>(3) contain $A_{2,1}$ and $A_{3,1}$ respectively, and so on.</p> <p>The imaginary parts of the diagonal elements need not be set and are assumed to be zero.</p>

Output Parameters

ap With *uplo* = 'U' or 'u', overwritten by the upper triangular part of the updated matrix.
 With *uplo* = 'L' or 'l', overwritten by the lower triangular part of the updated matrix.
 The imaginary parts of the diagonal elements need are set to zero.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine `hpr2` interface are the following:

ap Holds the array *ap* of size $(n*(n+1)/2)$.
x Holds the vector with the number of elements *n*.
y Holds the vector with the number of elements *n*.
uplo Must be 'U' or 'L'. The default value is 'U'.
alpha The default value is 1.

?sbmv

Computes a matrix-vector product using a symmetric band matrix.

Syntax

```
call ssbmv(uplo, n, k, alpha, a, lda, x, incx, beta, y, incy)
call dsbmv(uplo, n, k, alpha, a, lda, x, incx, beta, y, incy)
call sbmv(a, x, y [,uplo][,alpha] [,beta])
```

Include Files

- `mkl.fi, blas.f90`

Description

The `?sbmv` routines perform a matrix-vector operation defined as

$$y := \alpha A x + \beta y,$$

where:

alpha and *beta* are scalars,

x and *y* are *n*-element vectors,

A is an *n*-by-*n* symmetric band matrix, with *k* super-diagonals.

Input Parameters

uplo CHARACTER*1. Specifies whether the upper or lower triangular part of the band matrix *A* is used:

if *uplo* = 'U' or 'u' - upper triangular part;

if *uplo* = 'L' or 'l' - low triangular part.

n INTEGER. Specifies the order of the matrix *A*. The value of *n* must be at least zero.

k INTEGER. Specifies the number of super-diagonals of the matrix *A*.
The value of *k* must satisfy $0 \leq k$.

alpha REAL for *ssbm*v
DOUBLE PRECISION for *dsbm*v
Specifies the scalar *alpha*.

a REAL for *ssbm*v
DOUBLE PRECISION for *dsbm*v
Array, size (*lda*, *n*). Before entry with *uplo* = 'U' or 'u', the leading (*k* + 1) by *n* part of the array *a* must contain the upper triangular band part of the symmetric matrix, supplied column-by-column, with the leading diagonal of the matrix in row (*k* + 1) of the array, the first super-diagonal starting at position 2 in row *k*, and so on. The top left *k* by *k* triangle of the array *a* is not referenced.

The following program segment transfers the upper triangular part of a symmetric band matrix from conventional full matrix storage (*matrix*) to band storage (*a*):

```

      do 20, j = 1, n
        m = k + 1 - j
        do 10, i = max( 1, j - k ), j
          a( m + i, j ) = matrix( i, j )
10      continue
20      continue

```

Before entry with *uplo* = 'L' or 'l', the leading (*k* + 1) by *n* part of the array *a* must contain the lower triangular band part of the symmetric matrix, supplied column-by-column, with the leading diagonal of the matrix in row 1 of the array, the first sub-diagonal starting at position 1 in row 2, and so on. The bottom right *k* by *k* triangle of the array *a* is not referenced.

The following program segment transfers the lower triangular part of a symmetric band matrix from conventional full matrix storage (*matrix*) to band storage (*a*):

```

      do 20, j = 1, n
        m = 1 - j
        do 10, i = j, min( n, j + k )
          a( m + i, j ) = matrix( i, j )
10      continue
20      continue

```

lda INTEGER. Specifies the leading dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least (*k* + 1).

x REAL for *ssbm*v
DOUBLE PRECISION for *dsbm*v

	Array, size at least $(1 + (n - 1) * \text{abs}(incx))$. Before entry, the incremented array x must contain the vector x .
<i>incx</i>	INTEGER. Specifies the increment for the elements of x . The value of <i>incx</i> must not be zero.
<i>beta</i>	REAL for <i>ssbm</i> v DOUBLE PRECISION for <i>dsbm</i> v Specifies the scalar <i>beta</i> .
<i>y</i>	REAL for <i>ssbm</i> v DOUBLE PRECISION for <i>dsbm</i> v Array, size at least $(1 + (n - 1) * \text{abs}(incy))$. Before entry, the incremented array y must contain the vector y .
<i>incy</i>	INTEGER. Specifies the increment for the elements of y . The value of <i>incy</i> must not be zero.

Output Parameters

<i>y</i>	Overwritten by the updated vector y .
----------	---

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine *sbmv* interface are the following:

<i>a</i>	Holds the array <i>a</i> of size $(k+1, n)$.
<i>x</i>	Holds the vector with the number of elements n .
<i>y</i>	Holds the vector with the number of elements n .
<i>uplo</i>	Must be 'U' or 'L'. The default value is 'U'.
<i>alpha</i>	The default value is 1.
<i>beta</i>	The default value is 0.

?spmv

Computes a matrix-vector product using a symmetric packed matrix.

Syntax

```
call sspmv(uplo, n, alpha, ap, x, incx, beta, y, incy)
call dspmv(uplo, n, alpha, ap, x, incx, beta, y, incy)
call spmv(ap, x, y [,uplo] [,alpha] [,beta])
```

Include Files

- `mkl.fi`, `blas.f90`

Description

The `?spmv` routines perform a matrix-vector operation defined as

```
y := alpha*A*x + beta*y,
```

where:

alpha and *beta* are scalars,

x and *y* are *n*-element vectors,

A is an *n*-by-*n* symmetric matrix, supplied in packed form.

Input Parameters

<i>uplo</i>	<p>CHARACTER*1. Specifies whether the upper or lower triangular part of the matrix <i>A</i> is supplied in the packed array <i>ap</i>.</p> <p>If <i>uplo</i> = 'U' or 'u', then the upper triangular part of the matrix <i>A</i> is supplied in the packed array <i>ap</i>.</p> <p>If <i>uplo</i> = 'L' or 'l', then the low triangular part of the matrix <i>A</i> is supplied in the packed array <i>ap</i>.</p>
<i>n</i>	<p>INTEGER. Specifies the order of the matrix <i>A</i>. The value of <i>n</i> must be at least zero.</p>
<i>alpha</i>	<p>REAL for <code>sspmv</code></p> <p>DOUBLE PRECISION for <code>dspmv</code></p> <p>Specifies the scalar <i>alpha</i>.</p>
<i>ap</i>	<p>REAL for <code>sspmv</code></p> <p>DOUBLE PRECISION for <code>dspmv</code></p> <p>Array, size at least $((n*(n + 1))/2)$.</p> <p>Before entry with <i>uplo</i> = 'U' or 'u', the array <i>ap</i> must contain the upper triangular part of the symmetric matrix packed sequentially, column-by-column, so that <i>ap</i>(1) contains <i>a</i>(1,1), <i>ap</i>(2) and <i>ap</i>(3) contain <i>a</i>(1,2) and <i>a</i>(2, 2) respectively, and so on. Before entry with <i>uplo</i> = 'L' or 'l', the array <i>ap</i> must contain the lower triangular part of the symmetric matrix packed sequentially, column-by-column, so that <i>ap</i>(1) contains <i>a</i>(1,1), <i>ap</i>(2) and <i>ap</i>(3) contain <i>a</i>(2,1) and <i>a</i>(3,1) respectively, and so on.</p>
<i>x</i>	<p>REAL for <code>sspmv</code></p> <p>DOUBLE PRECISION for <code>dspmv</code></p> <p>Array, size at least $(1 + (n - 1)*abs(incx))$. Before entry, the incremented array <i>x</i> must contain the <i>n</i>-element vector <i>x</i>.</p>
<i>incx</i>	<p>INTEGER. Specifies the increment for the elements of <i>x</i>.</p> <p>The value of <i>incx</i> must not be zero.</p>

<i>beta</i>	REAL for <code>sspmv</code> DOUBLE PRECISION for <code>dspmv</code> Specifies the scalar <i>beta</i> . When <i>beta</i> is supplied as zero, then <i>y</i> need not be set on input.
<i>y</i>	REAL for <code>sspmv</code> DOUBLE PRECISION for <code>dspmv</code> Array, size at least $(1 + (n - 1) * \text{abs}(\text{incy}))$. Before entry, the incremented array <i>y</i> must contain the <i>n</i> -element vector <i>y</i> .
<i>incy</i>	INTEGER. Specifies the increment for the elements of <i>y</i> . The value of <i>incy</i> must not be zero.

Output Parameters

<i>y</i>	Overwritten by the updated vector <i>y</i> .
----------	--

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine `spmv` interface are the following:

<i>ap</i>	Holds the array <i>ap</i> of size $(n*(n+1)/2)$.
<i>x</i>	Holds the vector with the number of elements <i>n</i> .
<i>y</i>	Holds the vector with the number of elements <i>n</i> .
<i>uplo</i>	Must be 'U' or 'L'. The default value is 'U'.
<i>alpha</i>	The default value is 1.
<i>beta</i>	The default value is 0.

?spr

Performs a rank-1 update of a symmetric packed matrix.

Syntax

```
call sspr(uplo, n, alpha, x, incx, ap)
call dspr(uplo, n, alpha, x, incx, ap)
call spr(ap, x [,uplo] [, alpha])
```

Include Files

- `mkl.fi, blas.f90`

Description

The ?s_{pr} routines perform a matrix-vector operation defined as

$$a := \alpha * x * x' + A,$$

where:

α is a real scalar,

x is an n -element vector,

A is an n -by- n symmetric matrix, supplied in packed form.

Input Parameters

<i>uplo</i>	<p>CHARACTER*1. Specifies whether the upper or lower triangular part of the matrix A is supplied in the packed array <i>ap</i>.</p> <p>If <i>uplo</i> = 'U' or 'u', then the upper triangular part of the matrix A is supplied in the packed array <i>ap</i>.</p> <p>If <i>uplo</i> = 'L' or 'l', then the low triangular part of the matrix A is supplied in the packed array <i>ap</i>.</p>
<i>n</i>	<p>INTEGER. Specifies the order of the matrix A. The value of n must be at least zero.</p>
<i>alpha</i>	<p>REAL for sspr DOUBLE PRECISION for dspr</p> <p>Specifies the scalar α.</p>
<i>x</i>	<p>REAL for sspr DOUBLE PRECISION for dspr</p> <p>Array, size at least $(1 + (n - 1) * \text{abs}(\text{incx}))$. Before entry, the incremented array x must contain the n-element vector x.</p>
<i>incx</i>	<p>INTEGER. Specifies the increment for the elements of x.</p> <p>The value of <i>incx</i> must not be zero.</p>
<i>ap</i>	<p>REAL for sspr DOUBLE PRECISION for dspr</p> <p>Before entry with <i>uplo</i> = 'U' or 'u', the array <i>ap</i> must contain the upper triangular part of the symmetric matrix packed sequentially, column-by-column, so that <i>ap</i>(1) contains $A_{1,1}$, <i>ap</i>(2) and <i>ap</i>(3) contain $A_{1,2}$ and $A_{2,2}$ respectively, and so on.</p> <p>Before entry with <i>uplo</i> = 'L' or 'l', the array <i>ap</i> must contain the lower triangular part of the symmetric matrix packed sequentially, column-by-column, so that <i>ap</i>(1) contains $A_{1,1}$, <i>ap</i>(2) and <i>ap</i>(3) contain $A_{2,1}$ and $A_{3,1}$ respectively, and so on.</p>

Output Parameters

<i>ap</i>	<p>With <i>uplo</i> = 'U' or 'u', overwritten by the upper triangular part of the updated matrix.</p>
-----------	---

With `uplo = 'L' or 'l'`, overwritten by the lower triangular part of the updated matrix.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine `spr` interface are the following:

<code>ap</code>	Holds the array <code>ap</code> of size $(n*(n+1)/2)$.
<code>x</code>	Holds the vector with the number of elements n .
<code>uplo</code>	Must be 'U' or 'L'. The default value is 'U'.
<code>alpha</code>	The default value is 1.

?spr2

Performs a rank-2 update of a symmetric packed matrix.

Syntax

```
call sspr2(uplo, n, alpha, x, incx, y, incy, ap)
call dspr2(uplo, n, alpha, x, incx, y, incy, ap)
call spr2(ap, x, y [,uplo][,alpha])
```

Include Files

- `mkl.fi, blas.f90`

Description

The `?spr2` routines perform a matrix-vector operation defined as

$$A := \alpha * x * y' + \alpha * y * x' + A,$$

where:

`alpha` is a scalar,

`x` and `y` are n -element vectors,

`A` is an n -by- n symmetric matrix, supplied in packed form.

Input Parameters

`uplo` CHARACTER*1. Specifies whether the upper or lower triangular part of the matrix `A` is supplied in the packed array `ap`.

If `uplo = 'U' or 'u'`, then the upper triangular part of the matrix `A` is supplied in the packed array `ap`.

If `uplo = 'L' or 'l'`, then the low triangular part of the matrix `A` is supplied in the packed array `ap`.

<i>n</i>	INTEGER. Specifies the order of the matrix <i>A</i> . The value of <i>n</i> must be at least zero.
<i>alpha</i>	REAL for <i>sspr2</i> DOUBLE PRECISION for <i>dspr2</i> Specifies the scalar <i>alpha</i> .
<i>x</i>	REAL for <i>sspr2</i> DOUBLE PRECISION for <i>dspr2</i> Array, size at least $(1 + (n - 1) * \text{abs}(\text{incx}))$. Before entry, the incremented array <i>x</i> must contain the <i>n</i> -element vector <i>x</i> .
<i>incx</i>	INTEGER. Specifies the increment for the elements of <i>x</i> . The value of <i>incx</i> must not be zero.
<i>y</i>	REAL for <i>sspr2</i> DOUBLE PRECISION for <i>dspr2</i> Array, size at least $(1 + (n - 1) * \text{abs}(\text{incy}))$. Before entry, the incremented array <i>y</i> must contain the <i>n</i> -element vector <i>y</i> .
<i>incy</i>	INTEGER. Specifies the increment for the elements of <i>y</i> . The value of <i>incy</i> must not be zero.
<i>ap</i>	REAL for <i>sspr2</i> DOUBLE PRECISION for <i>dspr2</i> Before entry with <i>uplo</i> = 'U' or 'u', the array <i>ap</i> must contain the upper triangular part of the symmetric matrix packed sequentially, column-by-column, so that <i>ap</i> (1) contains $A_{1,1}$, <i>ap</i> (2) and <i>ap</i> (3) contain $A_{1,2}$ and $A_{2,2}$ respectively, and so on. Before entry with <i>uplo</i> = 'L' or 'l', the array <i>ap</i> must contain the lower triangular part of the symmetric matrix packed sequentially, column-by-column, so that <i>ap</i> (1) contains $A_{1,1}$, <i>ap</i> (2) and <i>ap</i> (3) contain $A_{2,1}$ and $A_{3,1}$ respectively, and so on.

Output Parameters

<i>ap</i>	With <i>uplo</i> = 'U' or 'u', overwritten by the upper triangular part of the updated matrix. With <i>uplo</i> = 'L' or 'l', overwritten by the lower triangular part of the updated matrix.
-----------	--

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine *spr2* interface are the following:

<i>ap</i>	Holds the array <i>ap</i> of size $(n*(n+1)/2)$.
-----------	---

<i>x</i>	Holds the vector with the number of elements <i>n</i> .
<i>y</i>	Holds the vector with the number of elements <i>n</i> .
<i>uplo</i>	Must be 'U' or 'L'. The default value is 'U'.
<i>alpha</i>	The default value is 1.

?symv

Computes a matrix-vector product for a symmetric matrix.

Syntax

```
call ssymv(uplo, n, alpha, a, lda, x, incx, beta, y, incy)
call dsymv(uplo, n, alpha, a, lda, x, incx, beta, y, incy)
call symv(a, x, y [,uplo][,alpha] [,beta])
```

Include Files

- mkl.fi, blas.f90

Description

The ?symv routines perform a matrix-vector operation defined as

$$y := \alpha A x + \beta y,$$

where:

alpha and *beta* are scalars,

x and *y* are *n*-element vectors,

A is an *n*-by-*n* symmetric matrix.

Input Parameters

<i>uplo</i>	<p>CHARACTER*1. Specifies whether the upper or lower triangular part of the array <i>a</i> is used.</p> <p>If <i>uplo</i> = 'U' or 'u', then the upper triangular part of the array <i>a</i> is used.</p> <p>If <i>uplo</i> = 'L' or 'l', then the low triangular part of the array <i>a</i> is used.</p>
<i>n</i>	<p>INTEGER. Specifies the order of the matrix <i>A</i>. The value of <i>n</i> must be at least zero.</p>
<i>alpha</i>	<p>REAL for ssymv</p> <p>DOUBLE PRECISION for dsymv</p> <p>Specifies the scalar <i>alpha</i>.</p>
<i>a</i>	<p>REAL for ssymv</p> <p>DOUBLE PRECISION for dsymv</p> <p>Array, size (<i>lda</i>, <i>n</i>).</p>

Before entry with *uplo* = 'U' or 'u', the leading *n*-by-*n* upper triangular part of the array *a* must contain the upper triangular part of the symmetric matrix *A* and the strictly lower triangular part of *a* is not referenced. Before entry with *uplo* = 'L' or 'l', the leading *n*-by-*n* lower triangular part of the array *a* must contain the lower triangular part of the symmetric matrix *A* and the strictly upper triangular part of *a* is not referenced.

lda INTEGER. Specifies the leading dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least $\max(1, n)$.

x REAL for *ssymv*
DOUBLE PRECISION for *dsymv*
Array, size at least $(1 + (n - 1) * \text{abs}(\text{incx}))$. Before entry, the incremented array *x* must contain the *n*-element vector *x*.

incx INTEGER. Specifies the increment for the elements of *x*.
The value of *incx* must not be zero.

beta REAL for *ssymv*
DOUBLE PRECISION for *dsymv*
Specifies the scalar *beta*.
When *beta* is supplied as zero, then *y* need not be set on input.

y REAL for *ssymv*
DOUBLE PRECISION for *dsymv*
Array, size at least $(1 + (n - 1) * \text{abs}(\text{incy}))$. Before entry, the incremented array *y* must contain the *n*-element vector *y*.

incy INTEGER. Specifies the increment for the elements of *y*.
The value of *incy* must not be zero.

Output Parameters

y Overwritten by the updated vector *y*.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine *symv* interface are the following:

a Holds the matrix *A* of size (n, n) .
x Holds the vector with the number of elements *n*.
y Holds the vector with the number of elements *n*.
uplo Must be 'U' or 'L'. The default value is 'U'.
alpha The default value is 1.

beta The default value is 0.

?syr

Performs a rank-1 update of a symmetric matrix.

Syntax

```
call ssyr(uplo, n, alpha, x, incx, a, lda)
call dsyr(uplo, n, alpha, x, incx, a, lda)
call syr(a, x [,uplo] [, alpha])
```

Include Files

- mkl.fi, blas.f90

Description

The ?syr routines perform a matrix-vector operation defined as

$$A := \alpha x x^T + A,$$

where:

alpha is a real scalar,

x is an *n*-element vector,

A is an *n*-by-*n* symmetric matrix.

Input Parameters

<i>uplo</i>	<p>CHARACTER*1. Specifies whether the upper or lower triangular part of the array <i>a</i> is used.</p> <p>If <i>uplo</i> = 'U' or 'u', then the upper triangular part of the array <i>a</i> is used.</p> <p>If <i>uplo</i> = 'L' or 'l', then the low triangular part of the array <i>a</i> is used.</p>
<i>n</i>	<p>INTEGER. Specifies the order of the matrix <i>A</i>. The value of <i>n</i> must be at least zero.</p>
<i>alpha</i>	<p>REAL for ssyr</p> <p>DOUBLE PRECISION for dsyr</p> <p>Specifies the scalar <i>alpha</i>.</p>
<i>x</i>	<p>REAL for ssyr</p> <p>DOUBLE PRECISION for dsyr</p> <p>Array, size at least $(1 + (n-1) * \text{abs}(\text{incx}))$. Before entry, the incremented array <i>x</i> must contain the <i>n</i>-element vector <i>x</i>.</p>
<i>incx</i>	<p>INTEGER. Specifies the increment for the elements of <i>x</i>.</p> <p>The value of <i>incx</i> must not be zero.</p>
<i>a</i>	<p>REAL for ssyr</p> <p>DOUBLE PRECISION for dsyr</p>

Array, size (lda, n) .

Before entry with $uplo = 'U'$ or $'u'$, the leading n -by- n upper triangular part of the array a must contain the upper triangular part of the symmetric matrix A and the strictly lower triangular part of a is not referenced.

Before entry with $uplo = 'L'$ or $'l'$, the leading n -by- n lower triangular part of the array a must contain the lower triangular part of the symmetric matrix A and the strictly upper triangular part of a is not referenced.

lda

INTEGER. Specifies the leading dimension of a as declared in the calling (sub)program. The value of lda must be at least $\max(1, n)$.

Output Parameters

a

With $uplo = 'U'$ or $'u'$, the upper triangular part of the array a is overwritten by the upper triangular part of the updated matrix.

With $uplo = 'L'$ or $'l'$, the lower triangular part of the array a is overwritten by the lower triangular part of the updated matrix.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine `syr` interface are the following:

a

Holds the matrix A of size (n,n) .

x

Holds the vector with the number of elements n .

$uplo$

Must be $'U'$ or $'L'$. The default value is $'U'$.

$alpha$

The default value is 1.

?syr2

Performs a rank-2 update of symmetric matrix.

Syntax

```
call ssyr2(uplo, n, alpha, x, incx, y, incy, a, lda)
```

```
call dsyr2(uplo, n, alpha, x, incx, y, incy, a, lda)
```

```
call syr2(a, x, y [,uplo][,alpha])
```

Include Files

- `mkl.fi`, `blas.f90`

Description

The `?syr2` routines perform a matrix-vector operation defined as

$$A := \alpha x x^T + \alpha y y^T + A,$$

where:

α is a scalar,

x and y are n -element vectors,
 A is an n -by- n symmetric matrix.

Input Parameters

<i>uplo</i>	<p>CHARACTER*1. Specifies whether the upper or lower triangular part of the array a is used.</p> <p>If <i>uplo</i> = 'U' or 'u', then the upper triangular part of the array a is used.</p> <p>If <i>uplo</i> = 'L' or 'l', then the low triangular part of the array a is used.</p>
<i>n</i>	<p>INTEGER. Specifies the order of the matrix A. The value of n must be at least zero.</p>
<i>alpha</i>	<p>REAL for ssyr2</p> <p>DOUBLE PRECISION for dsyr2</p> <p>Specifies the scalar <i>alpha</i>.</p>
<i>x</i>	<p>REAL for ssyr2</p> <p>DOUBLE PRECISION for dsyr2</p> <p>Array, size at least $(1 + (n - 1) * \text{abs}(\text{incx}))$. Before entry, the incremented array x must contain the n-element vector x.</p>
<i>incx</i>	<p>INTEGER. Specifies the increment for the elements of x.</p> <p>The value of <i>incx</i> must not be zero.</p>
<i>y</i>	<p>REAL for ssyr2</p> <p>DOUBLE PRECISION for dsyr2</p> <p>Array, size at least $(1 + (n - 1) * \text{abs}(\text{incy}))$. Before entry, the incremented array y must contain the n-element vector y.</p>
<i>incy</i>	<p>INTEGER. Specifies the increment for the elements of y. The value of <i>incy</i> must not be zero.</p>
<i>a</i>	<p>REAL for ssyr2</p> <p>DOUBLE PRECISION for dsyr2</p> <p>Array, size (lda, n).</p> <p>Before entry with <i>uplo</i> = 'U' or 'u', the leading n-by-n upper triangular part of the array a must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of a is not referenced.</p> <p>Before entry with <i>uplo</i> = 'L' or 'l', the leading n-by-n lower triangular part of the array a must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of a is not referenced.</p>
<i>lda</i>	<p>INTEGER. Specifies the leading dimension of a as declared in the calling (sub)program. The value of <i>lda</i> must be at least $\max(1, n)$.</p>

Output Parameters

a With *uplo* = 'U' or 'u', the upper triangular part of the array *a* is overwritten by the upper triangular part of the updated matrix.
With *uplo* = 'L' or 'l', the lower triangular part of the array *a* is overwritten by the lower triangular part of the updated matrix.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine `syrr2` interface are the following:

<i>a</i>	Holds the matrix <i>A</i> of size (n,n) .
<i>x</i>	Holds the vector <i>x</i> of length <i>n</i> .
<i>y</i>	Holds the vector <i>y</i> of length <i>n</i> .
<i>uplo</i>	Must be 'U' or 'L'. The default value is 'U'.
<i>alpha</i>	The default value is 1.

?tbmv

Computes a matrix-vector product using a triangular band matrix.

Syntax

```
call stbmv(uplo, trans, diag, n, k, a, lda, x, incx)
call dtbmv(uplo, trans, diag, n, k, a, lda, x, incx)
call ctbmv(uplo, trans, diag, n, k, a, lda, x, incx)
call ztbmv(uplo, trans, diag, n, k, a, lda, x, incx)
call tbmv(a, x [,uplo] [, trans] [,diag])
```

Include Files

- `mkl.fi`, `blas.f90`

Description

The `?tbmv` routines perform one of the matrix-vector operations defined as

$x := A * x$, or $x := A' * x$, or $x := \text{conjg}(A') * x$,

where:

x is an *n*-element vector,

A is an *n*-by-*n* unit, or non-unit, upper or lower triangular band matrix, with $(k + 1)$ diagonals.

Input Parameters

uplo CHARACTER*1. Specifies whether the matrix *A* is an upper or lower triangular matrix:

	<code>uplo = 'U' or 'u'</code> if <code>uplo = 'L' or 'l'</code> , then the matrix is low triangular.
<code>trans</code>	CHARACTER*1. Specifies the operation: if <code>trans= 'N' or 'n'</code> , then $x := A*x$; if <code>trans= 'T' or 't'</code> , then $x := A'*x$; if <code>trans= 'C' or 'c'</code> , then $x := \text{conjg}(A')*x$.
<code>diag</code>	CHARACTER*1. Specifies whether the matrix A is unit triangular: if <code>uplo = 'U' or 'u'</code> then the matrix is unit triangular; if <code>diag = 'N' or 'n'</code> , then the matrix is not unit triangular.
<code>n</code>	INTEGER. Specifies the order of the matrix A . The value of n must be at least zero.
<code>k</code>	INTEGER. On entry with <code>uplo = 'U' or 'u'</code> specifies the number of super-diagonals of the matrix A . On entry with <code>uplo = 'L' or 'l'</code> , k specifies the number of sub-diagonals of the matrix a . The value of k must satisfy $0 \leq k$.
<code>a</code>	REAL for <code>stbmv</code> DOUBLE PRECISION for <code>dtbmv</code> COMPLEX for <code>ctbmv</code> DOUBLE COMPLEX for <code>ztbmv</code> Array, size <code>(lda, n)</code> . Before entry with <code>uplo = 'U' or 'u'</code> , the leading $(k + 1)$ by n part of the array a must contain the upper triangular band part of the matrix of coefficients, supplied column-by-column, with the leading diagonal of the matrix in row $(k + 1)$ of the array, the first super-diagonal starting at position 2 in row k , and so on. The top left k by k triangle of the array a is not referenced. The following program segment transfers an upper triangular band matrix from conventional full matrix storage (<i>matrix</i>) to band storage (<i>a</i>): <pre> do 20, j = 1, n m = k + 1 - j do 10, i = max(1, j - k), j a(m + i, j) = matrix(i, j) 10 continue 20 continue </pre> Before entry with <code>uplo = 'L' or 'l'</code> , the leading $(k + 1)$ by n part of the array a must contain the lower triangular band part of the matrix of coefficients, supplied column-by-column, with the leading diagonal of the matrix in row 1 of the array, the first sub-diagonal starting at position 1 in row 2, and so on. The bottom right k by k triangle of the array a is not

referenced. The following program segment transfers a lower triangular band matrix from conventional full matrix storage (*matrix*) to band storage (*a*):

```

do 20, j = 1, n
  m = 1 - j
  do 10, i = j, min( n, j + k )
    a( m + i, j ) = matrix( i, j )
10    continue
20    continue

```

Note that when *uplo* = 'U' or 'u', the elements of the array *a* corresponding to the diagonal elements of the matrix are not referenced, but are assumed to be unity.

lda INTEGER. Specifies the leading dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least $(k + 1)$.

x REAL for stbmv
DOUBLE PRECISION for dtbmv
COMPLEX for ctbmv
DOUBLE COMPLEX for ztbmv

Array, size at least $(1 + (n - 1) * \text{abs}(\text{incx}))$. Before entry, the incremented array *x* must contain the *n*-element vector *x*.

incx INTEGER. Specifies the increment for the elements of *x*.
The value of *incx* must not be zero.

Output Parameters

x Overwritten with the transformed vector *x*.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine *tbmv* interface are the following:

a Holds the array *a* of size $(k+1,n)$.

x Holds the vector with the number of elements *n*.

uplo Must be 'U' or 'L'. The default value is 'U'.

trans Must be 'N', 'C', or 'T'.
The default value is 'N'.

diag Must be 'N' or 'U'. The default value is 'N'.

?tbsv

Solves a system of linear equations whose coefficients are in a triangular band matrix.

Syntax

```
call stbsv(uplo, trans, diag, n, k, a, lda, x, incx)
call dtbsv(uplo, trans, diag, n, k, a, lda, x, incx)
call ctbsv(uplo, trans, diag, n, k, a, lda, x, incx)
call ztbsv(uplo, trans, diag, n, k, a, lda, x, incx)
call tbsv(a, x [,uplo] [, trans] [,diag])
```

Include Files

- mkl.fi, blas.f90

Description

The ?tbsv routines solve one of the following systems of equations:

$A*x = b$, or $A'*x = b$, or $\text{conjg}(A')*x = b$,

where:

b and x are n -element vectors,

A is an n -by- n unit, or non-unit, upper or lower triangular band matrix, with $(k + 1)$ diagonals.

The routine does not test for singularity or near-singularity.

Such tests must be performed before calling this routine.

Input Parameters

<i>uplo</i>	<p>CHARACTER*1. Specifies whether the matrix A is an upper or lower triangular matrix:</p> <p>if <i>uplo</i> = 'U' or 'u' the matrix is upper triangular;</p> <p>if <i>uplo</i> = 'L' or 'l', the matrix is low triangular.</p>
<i>trans</i>	<p>CHARACTER*1. Specifies the system of equations:</p> <p>if <i>trans</i> = 'N' or 'n', then $A*x = b$;</p> <p>if <i>trans</i> = 'T' or 't', then $A'*x = b$;</p> <p>if <i>trans</i> = 'C' or 'c', then $\text{conjg}(A')*x = b$.</p>
<i>diag</i>	<p>CHARACTER*1. Specifies whether the matrix A is unit triangular:</p> <p>if <i>diag</i> = 'U' or 'u' then the matrix is unit triangular;</p> <p>if <i>diag</i> = 'N' or 'n', then the matrix is not unit triangular.</p>
<i>n</i>	<p>INTEGER. Specifies the order of the matrix A. The value of n must be at least zero.</p>
<i>k</i>	<p>INTEGER. On entry with <i>uplo</i> = 'U' or 'u', k specifies the number of super-diagonals of the matrix A. On entry with <i>uplo</i> = 'L' or 'l', k specifies the number of sub-diagonals of the matrix A.</p> <p>The value of k must satisfy $0 \leq k$.</p>
<i>a</i>	<p>REAL for stbsv</p>

DOUBLE PRECISION for dtbsv

COMPLEX for ctbsv

DOUBLE COMPLEX for ztbsv

Array, size (lda, n) .

Before entry with $uplo = 'U'$ or $'u'$, the leading $(k + 1)$ by n part of the array a must contain the upper triangular band part of the matrix of coefficients, supplied column-by-column, with the leading diagonal of the matrix in row $(k + 1)$ of the array, the first super-diagonal starting at position 2 in row k , and so on. The top left k by k triangle of the array a is not referenced.

The following program segment transfers an upper triangular band matrix from conventional full matrix storage ($matrix$) to band storage (a):

```

do 20, j = 1, n
  m = k + 1 - j
  do 10, i = max( 1, j - k ), j
    a( m + i, j ) = matrix( i, j )
10  continue
20  continue

```

Before entry with $uplo = 'L'$ or $'l'$, the leading $(k + 1)$ by n part of the array a must contain the lower triangular band part of the matrix of coefficients, supplied column-by-column, with the leading diagonal of the matrix in row 1 of the array, the first sub-diagonal starting at position 1 in row 2, and so on. The bottom right k by k triangle of the array a is not referenced.

The following program segment transfers a lower triangular band matrix from conventional full matrix storage ($matrix$) to band storage (a):

```

do 20, j = 1, n
  m = 1 - j
  do 10, i = j, min( n, j + k )
    a( m + i, j ) = matrix( i, j )
10  continue
20  continue

```

When $diag = 'U'$ or $'u'$, the elements of the array a corresponding to the diagonal elements of the matrix are not referenced, but are assumed to be unity.

lda

INTEGER. Specifies the leading dimension of a as declared in the calling (sub)program. The value of lda must be at least $(k + 1)$.

x

REAL for stbsv

DOUBLE PRECISION for dtbsv

COMPLEX for ctbsv

DOUBLE COMPLEX for ztbsv

Array, size at least $(1 + (n - 1) * abs(incx))$. Before entry, the incremented array x must contain the n -element right-hand side vector b .

$incx$

INTEGER. Specifies the increment for the elements of x .

The value of $incx$ must not be zero.

Output Parameters

x Overwritten with the solution vector *x*.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine `tbsv` interface are the following:

<i>a</i>	Holds the array <i>a</i> of size $(k+1, n)$.
<i>x</i>	Holds the vector with the number of elements <i>n</i> .
<i>uplo</i>	Must be 'U' or 'L'. The default value is 'U'.
<i>trans</i>	Must be 'N', 'C', or 'T'. The default value is 'N'.
<i>diag</i>	Must be 'N' or 'U'. The default value is 'N'.

?tpmv

Computes a matrix-vector product using a triangular packed matrix.

Syntax

```
call stpmv(uplo, trans, diag, n, ap, x, incx)
call dtpmv(uplo, trans, diag, n, ap, x, incx)
call ctpmv(uplo, trans, diag, n, ap, x, incx)
call ztpmv(uplo, trans, diag, n, ap, x, incx)
call tpmv(ap, x [,uplo] [, trans] [,diag])
```

Include Files

- `mkl.fi, blas.f90`

Description

The `?tpmv` routines perform one of the matrix-vector operations defined as

$x := A^*x$, or $x := A'^*x$, or $x := \text{conjg}(A')^*x$,

where:

x is an *n*-element vector,

A is an *n*-by-*n* unit, or non-unit, upper or lower triangular matrix, supplied in packed form.

Input Parameters

<i>uplo</i>	CHARACTER*1. Specifies whether the matrix <i>A</i> is upper or lower triangular: <i>uplo</i> = 'U' or 'u'
-------------	--

	if <i>uplo</i> = 'L' or 'l', then the matrix is low triangular.
<i>trans</i>	<p>CHARACTER*1. Specifies the operation:</p> <p>if <i>trans</i> = 'N' or 'n', then $x := A*x$;</p> <p>if <i>trans</i> = 'T' or 't', then $x := A'*x$;</p> <p>if <i>trans</i> = 'C' or 'c', then $x := \text{conjg}(A')*x$.</p>
<i>diag</i>	<p>CHARACTER*1. Specifies whether the matrix <i>A</i> is unit triangular:</p> <p>if <i>diag</i> = 'U' or 'u' then the matrix is unit triangular;</p> <p>if <i>diag</i> = 'N' or 'n', then the matrix is not unit triangular.</p>
<i>n</i>	INTEGER. Specifies the order of the matrix <i>A</i> . The value of <i>n</i> must be at least zero.
<i>ap</i>	<p>REAL for <i>stpmv</i></p> <p>DOUBLE PRECISION for <i>dtpmv</i></p> <p>COMPLEX for <i>ctpmv</i></p> <p>DOUBLE COMPLEX for <i>ztpmv</i></p> <p>Array, size at least $((n*(n + 1))/2)$.</p> <p>Before entry with <i>uplo</i> = 'U' or 'u', the array <i>ap</i> must contain the upper triangular matrix packed sequentially, column-by-column, so that <i>ap</i>(1) contains <i>a</i>(1,1), <i>ap</i>(2) and <i>ap</i>(3) contain <i>a</i>(1,2) and <i>a</i>(2,2) respectively, and so on. Before entry with <i>uplo</i> = 'L' or 'l', the array <i>ap</i> must contain the lower triangular matrix packed sequentially, column-by-column, so that <i>ap</i>(1) contains <i>a</i>(1,1), <i>ap</i>(2) and <i>ap</i>(3) contain <i>a</i>(2,1) and <i>a</i>(3,1) respectively, and so on. When <i>diag</i> = 'U' or 'u', the diagonal elements of <i>a</i> are not referenced, but are assumed to be unity.</p>
<i>x</i>	<p>REAL for <i>stpmv</i></p> <p>DOUBLE PRECISION for <i>dtpmv</i></p> <p>COMPLEX for <i>ctpmv</i></p> <p>DOUBLE COMPLEX for <i>ztpmv</i></p> <p>Array, size at least $(1 + (n - 1)*\text{abs}(\text{incx}))$. Before entry, the incremented array <i>x</i> must contain the <i>n</i>-element vector <i>x</i>.</p>
<i>incx</i>	<p>INTEGER. Specifies the increment for the elements of <i>x</i>.</p> <p>The value of <i>incx</i> must not be zero.</p>

Output Parameters

<i>x</i>	Overwritten with the transformed vector <i>x</i> .
----------	--

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine `tpmv` interface are the following:

<code>ap</code>	Holds the array <code>ap</code> of size $(n*(n+1)/2)$.
<code>x</code>	Holds the vector with the number of elements n .
<code>uplo</code>	Must be 'U' or 'L'. The default value is 'U'.
<code>trans</code>	Must be 'N', 'C', or 'T'. The default value is 'N'.
<code>diag</code>	Must be 'N' or 'U'. The default value is 'N'.

?tpsv

Solves a system of linear equations whose coefficients are in a triangular packed matrix.

Syntax

```
call stpsv(uplo, trans, diag, n, ap, x, incx)
call dtpsv(uplo, trans, diag, n, ap, x, incx)
call ctpsv(uplo, trans, diag, n, ap, x, incx)
call ztpsv(uplo, trans, diag, n, ap, x, incx)
call tpsv(ap, x [,uplo] [, trans] [,diag])
```

Include Files

- `mkl.fi, blas.f90`

Description

The `?tpsv` routines solve one of the following systems of equations

$A*x = b$, or $A'*x = b$, or $\text{conjg}(A')*x = b$,

where:

b and x are n -element vectors,

A is an n -by- n unit, or non-unit, upper or lower triangular matrix, supplied in packed form.

This routine does not test for singularity or near-singularity.

Such tests must be performed before calling this routine.

Input Parameters

<code>uplo</code>	CHARACTER*1. Specifies whether the matrix A is upper or lower triangular: <code>uplo = 'U' or 'u'</code> if <code>uplo = 'L' or 'l'</code> , then the matrix is low triangular.
<code>trans</code>	CHARACTER*1. Specifies the system of equations: if <code>trans= 'N' or 'n'</code> , then $A*x = b$; if <code>trans= 'T' or 't'</code> , then $A'*x = b$;

	if <i>trans</i> = 'C' or 'c', then $\text{conjg}(A') * x = b$.
<i>diag</i>	<p>CHARACTER*1. Specifies whether the matrix <i>A</i> is unit triangular:</p> <p>if <i>diag</i> = 'U' or 'u' then the matrix is unit triangular;</p> <p>if <i>diag</i> = 'N' or 'n', then the matrix is not unit triangular.</p>
<i>n</i>	INTEGER. Specifies the order of the matrix <i>A</i> . The value of <i>n</i> must be at least zero.
<i>ap</i>	<p>REAL for <i>stpsv</i></p> <p>DOUBLE PRECISION for <i>dtpsv</i></p> <p>COMPLEX for <i>ctpsv</i></p> <p>DOUBLE COMPLEX for <i>ztpsv</i></p> <p>Array, size at least $((n * (n + 1)) / 2)$.</p> <p>Before entry with <i>uplo</i> = 'U' or 'u', the array <i>ap</i> must contain the upper triangular part of the triangular matrix packed sequentially, column-by-column, so that <i>ap</i>(1) contains <i>a</i>(1, 1), <i>ap</i>(2) and <i>ap</i>(3) contain <i>a</i>(1, 2) and <i>a</i>(2, 2) respectively, and so on.</p> <p>Before entry with <i>uplo</i> = 'L' or 'l', the array <i>ap</i> must contain the lower triangular part of the triangular matrix packed sequentially, column-by-column, so that <i>ap</i>(1) contains <i>a</i>(1, 1), <i>ap</i>(2) and <i>ap</i>(3) contain <i>a</i>(2, 1) and <i>a</i>(3, 1) respectively, and so on.</p> <p>When <i>diag</i> = 'U' or 'u', the diagonal elements of <i>a</i> are not referenced, but are assumed to be unity.</p>
<i>x</i>	<p>REAL for <i>stpsv</i></p> <p>DOUBLE PRECISION for <i>dtpsv</i></p> <p>COMPLEX for <i>ctpsv</i></p> <p>DOUBLE COMPLEX for <i>ztpsv</i></p> <p>Array, size at least $(1 + (n - 1) * \text{abs}(\text{incx}))$. Before entry, the incremented array <i>x</i> must contain the <i>n</i>-element right-hand side vector <i>b</i>.</p>
<i>incx</i>	<p>INTEGER. Specifies the increment for the elements of <i>x</i>.</p> <p>The value of <i>incx</i> must not be zero.</p>

Output Parameters

<i>x</i>	Overwritten with the solution vector <i>x</i> .
----------	---

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine *tpsv* interface are the following:

<i>ap</i>	Holds the array <i>ap</i> of size $(n * (n + 1)) / 2$.
-----------	---

<code>x</code>	Holds the vector with the number of elements n .
<code>uplo</code>	Must be 'U' or 'L'. The default value is 'U'.
<code>trans</code>	Must be 'N', 'C', or 'T'. The default value is 'N'.
<code>diag</code>	Must be 'N' or 'U'. The default value is 'N'.

?trmv

Computes a matrix-vector product using a triangular matrix.

Syntax

```
call strmv(uplo, trans, diag, n, a, lda, x, incx)
call dtrmv(uplo, trans, diag, n, a, lda, x, incx)
call ctrmv(uplo, trans, diag, n, a, lda, x, incx)
call ztrmv(uplo, trans, diag, n, a, lda, x, incx)
call trmv(a, x [,uplo] [, trans] [,diag])
```

Include Files

- `mkl.fi, blas.f90`

Description

The ?trmv routines perform one of the following matrix-vector operations defined as

$x := A*x$, or $x := A'*x$, or $x := \text{conjg}(A')*x$,

where:

x is an n -element vector,

A is an n -by- n unit, or non-unit, upper or lower triangular matrix.

Input Parameters

<code>uplo</code>	<p>CHARACTER*1. Specifies whether the matrix A is upper or lower triangular:</p> <p><code>uplo = 'U' or 'u'</code></p> <p>if <code>uplo = 'L' or 'l'</code>, then the matrix is low triangular.</p>
<code>trans</code>	<p>CHARACTER*1. Specifies the operation:</p> <p>if <code>trans= 'N' or 'n'</code>, then $x := A*x$;</p> <p>if <code>trans= 'T' or 't'</code>, then $x := A'*x$;</p> <p>if <code>trans= 'C' or 'c'</code>, then $x := \text{conjg}(A')*x$.</p>
<code>diag</code>	<p>CHARACTER*1. Specifies whether the matrix A is unit triangular:</p> <p>if <code>diag = 'U' or 'u'</code> then the matrix is unit triangular;</p> <p>if <code>diag = 'N' or 'n'</code>, then the matrix is not unit triangular.</p>

<i>n</i>	INTEGER. Specifies the order of the matrix <i>A</i> . The value of <i>n</i> must be at least zero.
<i>a</i>	REAL for <code>strmv</code> DOUBLE PRECISION for <code>dtrmv</code> COMPLEX for <code>ctrmv</code> DOUBLE COMPLEX for <code>ztrmv</code> Array, size (lda, n) . Before entry with <i>uplo</i> = 'U' or 'u', the leading <i>n</i> -by- <i>n</i> upper triangular part of the array <i>a</i> must contain the upper triangular matrix and the strictly lower triangular part of <i>a</i> is not referenced. Before entry with <i>uplo</i> = 'L' or 'l', the leading <i>n</i> -by- <i>n</i> lower triangular part of the array <i>a</i> must contain the lower triangular matrix and the strictly upper triangular part of <i>a</i> is not referenced. When <i>diag</i> = 'U' or 'u', the diagonal elements of <i>a</i> are not referenced either, but are assumed to be unity.
<i>lda</i>	INTEGER. Specifies the leading dimension of <i>a</i> as declared in the calling (sub)program. The value of <i>lda</i> must be at least $\max(1, n)$.
<i>x</i>	REAL for <code>strmv</code> DOUBLE PRECISION for <code>dtrmv</code> COMPLEX for <code>ctrmv</code> DOUBLE COMPLEX for <code>ztrmv</code> Array, size at least $(1 + (n - 1) * \text{abs}(\text{incx}))$. Before entry, the incremented array <i>x</i> must contain the <i>n</i> -element vector <i>x</i> .
<i>incx</i>	INTEGER. Specifies the increment for the elements of <i>x</i> . The value of <i>incx</i> must not be zero.

Output Parameters

<i>x</i>	Overwritten with the transformed vector <i>x</i> .
----------	--

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine `trmv` interface are the following:

<i>a</i>	Holds the matrix <i>A</i> of size (n,n) .
<i>x</i>	Holds the vector with the number of elements <i>n</i> .
<i>uplo</i>	Must be 'U' or 'L'. The default value is 'U'.
<i>trans</i>	Must be 'N', 'C', or 'T'. The default value is 'N'.

diag Must be 'N' or 'U'. The default value is 'N'.

?trsv

Solves a system of linear equations whose coefficients are in a triangular matrix.

Syntax

```
call strsv(uplo, trans, diag, n, a, lda, x, incx)
call dtrsv(uplo, trans, diag, n, a, lda, x, incx)
call ctrsv(uplo, trans, diag, n, a, lda, x, incx)
call ztrsv(uplo, trans, diag, n, a, lda, x, incx)
call trsv(a, x [,uplo] [, trans] [,diag])
```

Include Files

- mkl.fi, blas.f90

Description

The ?trsv routines solve one of the systems of equations:

$A*x = b$, or $A'*x = b$, or $\text{conjg}(A')*x = b$,

where:

b and x are n -element vectors,

A is an n -by- n unit, or non-unit, upper or lower triangular matrix.

The routine does not test for singularity or near-singularity.

Such tests must be performed before calling this routine.

Input Parameters

<i>uplo</i>	CHARACTER*1. Specifies whether the matrix A is upper or lower triangular: <i>uplo</i> = 'U' or 'u' if <i>uplo</i> = 'L' or 'l', then the matrix is low triangular.
<i>trans</i>	CHARACTER*1. Specifies the systems of equations: if <i>trans</i> = 'N' or 'n', then $A*x = b$; if <i>trans</i> = 'T' or 't', then $A'*x = b$; if <i>trans</i> = 'C' or 'c', then $\text{conjg}(A')*x = b$.
<i>diag</i>	CHARACTER*1. Specifies whether the matrix A is unit triangular: if <i>diag</i> = 'U' or 'u' then the matrix is unit triangular; if <i>diag</i> = 'N' or 'n', then the matrix is not unit triangular.
<i>n</i>	INTEGER. Specifies the order of the matrix A . The value of n must be at least zero.
<i>a</i>	REAL for strsv

DOUBLE PRECISION for dtrsv

COMPLEX for ctrsv

DOUBLE COMPLEX for ztrsv

Array, size (lda, n) . Before entry with $uplo = 'U'$ or $'u'$, the leading n -by- n upper triangular part of the array a must contain the upper triangular matrix and the strictly lower triangular part of a is not referenced. Before entry with $uplo = 'L'$ or $'l'$, the leading n -by- n lower triangular part of the array a must contain the lower triangular matrix and the strictly upper triangular part of a is not referenced.

When $diag = 'U'$ or $'u'$, the diagonal elements of a are not referenced either, but are assumed to be unity.

lda INTEGER. Specifies the leading dimension of a as declared in the calling (sub)program. The value of *lda* must be at least $\max(1, n)$.

x REAL for strsv
DOUBLE PRECISION for dtrsv
COMPLEX for ctrsv
DOUBLE COMPLEX for ztrsv

Array, size at least $(1 + (n - 1) * \text{abs}(incx))$. Before entry, the incremented array x must contain the n -element right-hand side vector b .

incx INTEGER. Specifies the increment for the elements of x .
The value of *incx* must not be zero.

Output Parameters

x Overwritten with the solution vector x .

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine `trsv` interface are the following:

a Holds the matrix a of size (n,n) .
x Holds the vector with the number of elements n .
uplo Must be $'U'$ or $'L'$. The default value is $'U'$.
trans Must be $'N'$, $'C'$, or $'T'$.
The default value is $'N'$.
diag Must be $'N'$ or $'U'$. The default value is $'N'$.

BLAS Level 3 Routines

BLAS Level 3 routines perform matrix-matrix operations. Table “BLAS Level 3 Routine Groups and Their Data Types” lists the BLAS Level 3 routine groups and the data types associated with them.

BLAS Level 3 Routine Groups and Their Data Types

Routine Group	Data Types	Description
<code>?gemm</code>	s, d, c, z	Computes a matrix-matrix product with general matrices.
<code>?hemm</code>	c, z	Computes a matrix-matrix product where one input matrix is Hermitian.
<code>?gemm_batch</code>	s, d, c, z	Computes scalar-matrix-matrix products and adds the results to scalar matrix products for groups of general matrices.
<code>?herk</code>	c, z	Performs a Hermitian rank-k update.
<code>?her2k</code>	c, z	Performs a Hermitian rank-2k update.
<code>?symm</code>	s, d, c, z	Computes a matrix-matrix product where one input matrix is symmetric.
<code>?syrk</code>	s, d, c, z	Performs a symmetric rank-k update.
<code>?syr2k</code>	s, d, c, z	Performs a symmetric rank-2k update.
<code>?trmm</code>	s, d, c, z	Computes a matrix-matrix product where one input matrix is triangular.
<code>?trsm</code>	s, d, c, z	Solves a triangular matrix equation.

Symmetric Multiprocessing Version of Intel® MKL

Many applications spend considerable time executing BLAS routines. This time can be scaled by the number of processors available on the system through using the symmetric multiprocessing (SMP) feature built into the Intel MKL Library. The performance enhancements based on the parallel use of the processors are available without any programming effort on your part.

To enhance performance, the library uses the following methods:

- The BLAS functions are blocked where possible to restructure the code in a way that increases the localization of data reference, enhances cache memory use, and reduces the dependency on the memory bus.
- The code is distributed across the processors to maximize parallelism.

Optimization Notice

Intel's compilers may or may not optimize to the same degree for non-Intel microprocessors for optimizations that are not unique to Intel microprocessors. These optimizations include SSE2, SSE3, and SSSE3 instruction sets and other optimizations. Intel does not guarantee the availability, functionality, or effectiveness of any optimization on microprocessors not manufactured by Intel. Microprocessor-dependent optimizations in this product are intended for use with Intel microprocessors. Certain optimizations not specific to Intel microarchitecture are reserved for Intel microprocessors. Please refer to the applicable product User and Reference Guides for more information regarding the specific instruction sets covered by this notice.

Notice revision #20110804

?gemm

Computes a matrix-matrix product with general matrices.

Syntax

```
call sgemm(transa, transb, m, n, k, alpha, a, lda, b, ldb, beta, c, ldc)
call dgemm(transa, transb, m, n, k, alpha, a, lda, b, ldb, beta, c, ldc)
call cgemm(transa, transb, m, n, k, alpha, a, lda, b, ldb, beta, c, ldc)
call zgemm(transa, transb, m, n, k, alpha, a, lda, b, ldb, beta, c, ldc)
call sgemm(transa, transb, m, n, k, alpha, a, lda, b, ldb, beta, c, ldc)
call dzgemm(transa, transb, m, n, k, alpha, a, lda, b, ldb, beta, c, ldc)
call gemm(a, b, c [,transa][,transb] [,alpha][,beta])
```

Include Files

- mkl.fi, blas.f90

Description

The ?gemm routines compute a scalar-matrix-matrix product and add the result to a scalar-matrix product, with general matrices. The operation is defined as

$$C := \alpha \text{op}(A) * \text{op}(B) + \beta C,$$

where:

$\text{op}(X)$ is one of $\text{op}(X) = X$, or $\text{op}(X) = X^T$, or $\text{op}(X) = X^H$,

α and β are scalars,

A , B and C are matrices:

$\text{op}(A)$ is an m -by- k matrix,

$\text{op}(B)$ is a k -by- n matrix,

C is an m -by- n matrix.

See also [?gemm3m](#), BLAS-like extension routines, that use matrix multiplication for similar matrix-matrix operations.

Input Parameters

<i>transa</i>	<p>CHARACTER*1. Specifies the form of $\text{op}(A)$ used in the matrix multiplication:</p> <p>if <i>transa</i> = 'N' or 'n', then $\text{op}(A) = A$;</p> <p>if <i>transa</i> = 'T' or 't', then $\text{op}(A) = A^T$;</p> <p>if <i>transa</i> = 'C' or 'c', then $\text{op}(A) = A^H$.</p>
<i>transb</i>	<p>CHARACTER*1. Specifies the form of $\text{op}(B)$ used in the matrix multiplication:</p> <p>if <i>transb</i> = 'N' or 'n', then $\text{op}(B) = B$;</p> <p>if <i>transb</i> = 'T' or 't', then $\text{op}(B) = B^T$;</p> <p>if <i>transb</i> = 'C' or 'c', then $\text{op}(B) = B^H$.</p>

<i>m</i>	<p>INTEGER. Specifies the number of rows of the matrix $\text{op}(A)$ and of the matrix <i>C</i>. The value of <i>m</i> must be at least zero.</p>
<i>n</i>	<p>INTEGER. Specifies the number of columns of the matrix $\text{op}(B)$ and the number of columns of the matrix <i>C</i>.</p> <p>The value of <i>n</i> must be at least zero.</p>
<i>k</i>	<p>INTEGER. Specifies the number of columns of the matrix $\text{op}(A)$ and the number of rows of the matrix $\text{op}(B)$.</p> <p>The value of <i>k</i> must be at least zero.</p>
<i>alpha</i>	<p>REAL for sgemm</p> <p>DOUBLE PRECISION for dgemm</p> <p>COMPLEX for cgemm, scgemm</p> <p>DOUBLE COMPLEX for zgemm, dzgemm</p> <p>Specifies the scalar <i>alpha</i>.</p>
<i>a</i>	<p>REAL for sgemm, scgemm</p> <p>DOUBLE PRECISION for dgemm, dzgemm</p> <p>COMPLEX for cgemm</p> <p>DOUBLE COMPLEX for zgemm</p> <p>Array, size <i>lda</i> by <i>ka</i>, where <i>ka</i> is <i>k</i> when <i>transa</i> = 'N' or 'n', and is <i>m</i> otherwise. Before entry with <i>transa</i> = 'N' or 'n', the leading <i>m</i>-by-<i>k</i> part of the array <i>a</i> must contain the matrix <i>A</i>, otherwise the leading <i>k</i>-by-<i>m</i> part of the array <i>a</i> must contain the matrix <i>A</i>.</p>
<i>lda</i>	<p>INTEGER. Specifies the leading dimension of <i>a</i> as declared in the calling (sub)program.</p> <p>When <i>transa</i> = 'N' or 'n', then <i>lda</i> must be at least $\max(1, m)$, otherwise <i>lda</i> must be at least $\max(1, k)$.</p>
<i>b</i>	<p>REAL for sgemm</p> <p>DOUBLE PRECISION for dgemm</p> <p>COMPLEX for cgemm, scgemm</p> <p>DOUBLE COMPLEX for zgemm, dzgemm</p> <p>Array, size <i>ldb</i> by <i>kb</i>, where <i>kb</i> is <i>n</i> when <i>transa</i> = 'N' or 'n', and is <i>k</i> otherwise. Before entry with <i>transa</i> = 'N' or 'n', the leading <i>k</i>-by-<i>n</i> part of the array <i>b</i> must contain the matrix <i>B</i>, otherwise the leading <i>n</i>-by-<i>k</i> part of the array <i>b</i> must contain the matrix <i>B</i>.</p>
<i>ldb</i>	<p>INTEGER. Specifies the leading dimension of <i>b</i> as declared in the calling (sub)program.</p> <p>When <i>transb</i> = 'N' or 'n', then <i>ldb</i> must be at least $\max(1, k)$, otherwise <i>ldb</i> must be at least $\max(1, n)$.</p>
<i>beta</i>	<p>REAL for sgemm</p>

DOUBLE PRECISION for `dgemm`
 COMPLEX for `cgemm`, `sgemm`
 DOUBLE COMPLEX for `zgemm`, `dzgemm`

Specifies the scalar *beta*.

When *beta* is equal to zero, then *c* need not be set on input.

c

REAL for `sgemm`
 DOUBLE PRECISION for `dgemm`
 COMPLEX for `cgemm`, `sgemm`
 DOUBLE COMPLEX for `zgemm`, `dzgemm`

Array, size *ldc* by *n*. Before entry, the leading *m*-by-*n* part of the array *c* must contain the matrix *C*, except when *beta* is equal to zero, in which case *c* need not be set on entry.

ldc

INTEGER. Specifies the leading dimension of *c* as declared in the calling (sub)program.

The value of *ldc* must be at least $\max(1, m)$.

Output Parameters

c

Overwritten by the *m*-by-*n* matrix $(\alpha * \text{op}(A) * \text{op}(B) + \beta * C)$.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine `gemm` interface are the following:

a

Holds the matrix *A* of size (*ma*,*ka*) where
 $ka = k$ if *transa*='N',
 $ka = m$ otherwise,
 $ma = m$ if *transa*='N',
 $ma = k$ otherwise.

b

Holds the matrix *B* of size (*mb*,*kb*) where
 $kb = n$ if *transb* = 'N',
 $kb = k$ otherwise,
 $mb = k$ if *transb* = 'N',
 $mb = n$ otherwise.

c

Holds the matrix *C* of size (*m*,*n*).

transa

Must be 'N', 'C', or 'T'.

The default value is 'N'.

<i>transb</i>	Must be 'N', 'C', or 'T'. The default value is 'N'.
<i>alpha</i>	The default value is 1.
<i>beta</i>	The default value is 0.

?hemm

Computes a matrix-matrix product where one input matrix is Hermitian.

Syntax

```
call chemm(side, uplo, m, n, alpha, a, lda, b, ldb, beta, c, ldc)
call zhemm(side, uplo, m, n, alpha, a, lda, b, ldb, beta, c, ldc)
call hemm(a, b, c [,side][,uplo] [,alpha][,beta])
```

Include Files

- mkl.fi, blas.f90

Description

The ?hemm routines compute a scalar-matrix-matrix product using a Hermitian matrix *A* and a general matrix *B* and add the result to a scalar-matrix product using a general matrix *C*. The operation is defined as

$$C := \alpha A^* B + \beta C$$

or

$$C := \alpha B^* A + \beta C,$$

where:

alpha and *beta* are scalars,

A is a Hermitian matrix,

B and *C* are *m*-by-*n* matrices.

Input Parameters

<i>side</i>	CHARACTER*1. Specifies whether the Hermitian matrix <i>A</i> appears on the left or right in the operation as follows: if <i>side</i> = 'L' or 'l', then $C := \alpha A^* B + \beta C$; if <i>side</i> = 'R' or 'r', then $C := \alpha B^* A + \beta C$.
<i>uplo</i>	CHARACTER*1. Specifies whether the upper or lower triangular part of the Hermitian matrix <i>A</i> is used: If <i>uplo</i> = 'U' or 'u', then the upper triangular part of the Hermitian matrix <i>A</i> is used. If <i>uplo</i> = 'L' or 'l', then the low triangular part of the Hermitian matrix <i>A</i> is used.
<i>m</i>	INTEGER. Specifies the number of rows of the matrix <i>C</i> .

	<p>The value of m must be at least zero.</p>
n	<p>INTEGER. Specifies the number of columns of the matrix C.</p> <p>The value of n must be at least zero.</p>
α	<p>COMPLEX for chemm</p> <p>DOUBLE COMPLEX for zhemm</p> <p>Specifies the scalar α.</p>
a	<p>COMPLEX for chemm</p> <p>DOUBLE COMPLEX for zhemm</p> <p>Array, size (lda, ka), where ka is m when $side = 'L'$ or $'l'$ and is n otherwise. Before entry with $side = 'L'$ or $'l'$, the m-by-m part of the array a must contain the Hermitian matrix, such that when $uplo = 'U'$ or $'u'$, the leading m-by-m upper triangular part of the array a must contain the upper triangular part of the Hermitian matrix and the strictly lower triangular part of a is not referenced, and when $uplo = 'L'$ or $'l'$, the leading m-by-m lower triangular part of the array a must contain the lower triangular part of the Hermitian matrix, and the strictly upper triangular part of a is not referenced.</p> <p>Before entry with $side = 'R'$ or $'r'$, the n-by-n part of the array a must contain the Hermitian matrix, such that when $uplo = 'U'$ or $'u'$, the leading n-by-n upper triangular part of the array a must contain the upper triangular part of the Hermitian matrix and the strictly lower triangular part of a is not referenced, and when $uplo = 'L'$ or $'l'$, the leading n-by-n lower triangular part of the array a must contain the lower triangular part of the Hermitian matrix, and the strictly upper triangular part of a is not referenced. The imaginary parts of the diagonal elements need not be set, they are assumed to be zero.</p>
lda	<p>INTEGER. Specifies the leading dimension of a as declared in the calling (sub) program. When $side = 'L'$ or $'l'$ then lda must be at least $\max(1, m)$, otherwise lda must be at least $\max(1, n)$.</p>
b	<p>COMPLEX for chemm</p> <p>DOUBLE COMPLEX for zhemm</p> <p>Array, size ldb by n.</p> <p>The leading m-by-n part of the array b must contain the matrix B.</p>
ldb	<p>INTEGER. Specifies the leading dimension of b as declared in the calling (sub)program. ldb must be at least $\max(1, m)$.</p>
β	<p>COMPLEX for chemm</p> <p>DOUBLE COMPLEX for zhemm</p> <p>Specifies the scalar β.</p> <p>When β is supplied as zero, then c need not be set on input.</p>
c	<p>COMPLEX for chemm</p> <p>DOUBLE COMPLEX for zhemm</p>

Array, size (c, n) . Before entry, the leading m -by- n part of the array c must contain the matrix C , except when β is zero, in which case c need not be set on entry.

ldc INTEGER. Specifies the leading dimension of c as declared in the calling (sub)program. *ldc* must be at least $\max(1, m)$.

Output Parameters

c Overwritten by the m -by- n updated matrix.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine `hemm` interface are the following:

<i>a</i>	Holds the matrix A of size (k,k) where $k = m$ if <i>side</i> = 'L', $k = n$ otherwise.
<i>b</i>	Holds the matrix B of size (m,n) .
<i>c</i>	Holds the matrix C of size (m,n) .
<i>side</i>	Must be 'L' or 'R'. The default value is 'L'.
<i>uplo</i>	Must be 'U' or 'L'. The default value is 'U'.
<i>alpha</i>	The default value is 1.
<i>beta</i>	The default value is 0.

?gemm_batch

Computes scalar-matrix-matrix products and adds the results to scalar matrix products for groups of general matrices.

Syntax

```
call sgemm_batch(transa_array, transb_array, m_array, n_array, k_array, alpha_array,
a_array, lda_array, b_array, ldb_array, beta_array, c_array, ldc_array, group_count,
group_size)
```

```
call dgemm_batch(transa_array, transb_array, m_array, n_array, k_array, alpha_array,
a_array, lda_array, b_array, ldb_array, beta_array, c_array, ldc_array, group_count,
group_size)
```

```
call cgemm_batch(transa_array, transb_array, m_array, n_array, k_array, alpha_array,
a_array, lda_array, b_array, ldb_array, beta_array, c_array, ldc_array, group_count,
group_size)
```

```
call zgemm_batch(transa_array, transb_array, m_array, n_array, k_array, alpha_array,
a_array, lda_array, b_array, ldb_array, beta_array, c_array, ldc_array, group_count,
group_size)
```

```
call gemm_batch(a_array, b_array, c_array, group_size [,transa_array][,transb_array]
[,alpha_array][,beta_array])
```

Include Files

- mkl.fi, blas.f90

Description

The ?gemm_batch routines perform a series of matrix-matrix operations with general matrices. They are similar to the ?gemm routine counterparts, but the ?gemm_batch routines perform matrix-matrix operations with groups of matrices, processing a number of groups at once. The groups contain matrices with the same parameters.

The operation is defined as

```
idx = 1
for i = 1..group_count
  alpha and beta in alpha_array(i) and beta_array(i)
  for j = 1..group_size(i)
    A, B, and C matrix in a_array(idx), b_array(idx), and c_array(idx)
    C := alpha*op(A)*op(B) + beta*C,
    idx = idx + 1
  end for
end for
```

where:

$\text{op}(X)$ is one of $\text{op}(X) = X$, or $\text{op}(X) = X^T$, or $\text{op}(X) = X^H$,

alpha and *beta* are scalar elements of *alpha_array* and *beta_array*,

A, *B* and *C* are matrices such that for *m*, *n*, and *k* which are elements of *m_array*, *n_array*, and *k_array*:

$\text{op}(A)$ is an *m*-by-*k* matrix,

$\text{op}(B)$ is a *k*-by-*n* matrix,

C is an *m*-by-*n* matrix.

A, *B*, and *C* represent matrices stored at addresses pointed to by *a_array*, *b_array*, and *c_array*, respectively. The number of entries in *a_array*, *b_array*, and *c_array* is *total_batch_count* = the sum of all of the *group_size* entries.

See also [gemm](#) for a detailed description of multiplication for general matrices and [?gemm3m_batch](#), BLAS-like extension routines for similar matrix-matrix operations.

NOTE

Error checking is not performed for Intel MKL Windows* single dynamic libraries for the ?gemm_batch routines.

Input Parameters

<i>transa_array</i>	CHARACTER*1. Array of size <i>group_count</i> . For the group <i>i</i> , <i>transa_i</i> = <i>transa_array</i> (<i>i</i>) specifies the form of $\text{op}(A)$ used in the matrix multiplication:
	if <i>transa_i</i> = 'N' or 'n', then $\text{op}(A) = A$;
	if <i>transa_i</i> = 'T' or 't', then $\text{op}(A) = A^T$;
	if <i>transa_i</i> = 'C' or 'c', then $\text{op}(A) = A^H$.

<i>transb_array</i>	<p>CHARACTER*1. Array of size <i>group_count</i>. For the group <i>i</i>, <i>transb_i</i> = <i>transb_array(i)</i> specifies the form of $\text{op}(B_i)$ used in the matrix multiplication:</p> <p>if <i>transb_i</i> = 'N' or 'n', then $\text{op}(B) = B$;</p> <p>if <i>transb_i</i> = 'T' or 't', then $\text{op}(B) = B^T$;</p> <p>if <i>transb_i</i> = 'C' or 'c', then $\text{op}(B) = B^H$.</p>
<i>m_array</i>	<p>INTEGER. Array of size <i>group_count</i>. For the group <i>i</i>, <i>m_i</i> = <i>m_array(i)</i> specifies the number of rows of the matrix $\text{op}(A)$ and of the matrix <i>C</i>.</p> <p>The value of each element of <i>m_array</i> must be at least zero.</p>
<i>n_array</i>	<p>INTEGER. Array of size <i>group_count</i>. For the group <i>i</i>, <i>n_i</i> = <i>n_array(i)</i> specifies the number of columns of the matrix $\text{op}(B)$ and the number of columns of the matrix <i>C</i>.</p> <p>The value of each element of <i>n_array</i> must be at least zero.</p>
<i>k_array</i>	<p>INTEGER. Array of size <i>group_count</i>. For the group <i>i</i>, <i>k_i</i> = <i>k_array(i)</i> specifies the number of columns of the matrix $\text{op}(A)$ and the number of rows of the matrix $\text{op}(B)$.</p> <p>The value of each element of <i>k_array</i> must be at least zero.</p>
<i>alpha_array</i>	<p>REAL for <i>sgemm_batch</i></p> <p>DOUBLE PRECISION for <i>dgemm_batch</i></p> <p>COMPLEX for <i>cgemm_batch</i>, <i>scgemm_batch</i></p> <p>DOUBLE COMPLEX for <i>zgemm_batch</i>, <i>dzgemm_batch</i></p> <p>Array of size <i>group_count</i>. For the group <i>i</i>, <i>alpha_array(i)</i> specifies the scalar <i>alpha_i</i>.</p>
<i>a_array</i>	<p>INTEGER*8 for Intel® 64 architecture</p> <p>INTEGER*4 for IA-32 architecture</p> <p>Array, size <i>total_batch_count</i>, of pointers to arrays used to store <i>A</i> matrices.</p>
<i>lda_array</i>	<p>INTEGER. Array of size <i>group_count</i>. For the group <i>i</i>, <i>lda_i</i> = <i>lda_array(i)</i> specifies the leading dimension of the array storing matrix <i>A</i> as declared in the calling (sub)program.</p> <p>When <i>transa_i</i> = 'N' or 'n', then <i>lda_i</i> must be at least $\max(1, m_i)$, otherwise <i>lda_i</i> must be at least $\max(1, k_i)$.</p>
<i>b_array</i>	<p>INTEGER*8 for Intel® 64 architecture</p> <p>INTEGER*4 for IA-32 architecture</p> <p>Array, size <i>total_batch_count</i>, of pointers to arrays used to store <i>B</i> matrices.</p>
<i>ldb_array</i>	<p>INTEGER.</p>

Array of size *group_count*. For the group *i*, $ldb_i = ldb_array(i)$ specifies the leading dimension of the array storing matrix *B* as declared in the calling (sub)program.

When $transb_i = 'N'$ or $'n'$, then ldb_i must be at least $\max(1, k_i)$, otherwise ldb_i must be at least $\max(1, n_i)$.

beta_array

REAL for sgemm_batch
DOUBLE PRECISION for dgemm_batch
COMPLEX for cgemm_batch, scgemm_batch
DOUBLE COMPLEX for zgemm_batch, dzgemm_batch

For the group *i*, *beta_array(i)* specifies the scalar *beta_i*.

When *beta_i* is equal to zero, then *C* matrices in group *i* need not be set on input.

c_array

INTEGER*8 for Intel® 64 architecture
INTEGER*4 for IA-32 architecture

Array, size *total_batch_count*, of pointers to arrays used to store *C* matrices.

ldc_array

INTEGER.

Array of size *group_count*. For the group *i*, $ldc_i = ldc_array(i)$ specifies the leading dimension of all arrays storing matrix *C* in group *i* as declared in the calling (sub)program.

ldc_i must be at least $\max(1, m_i)$.

group_count

INTEGER.

Specifies the number of groups. Must be at least 0.

group_size

INTEGER.

Array of size *group_count*. The element *group_size(i)* specifies the number of matrices in group *i*. Each element in *group_size* must be at least 0.

Output Parameters

c_array

Overwritten by the m_i -by- n_i matrix $(\alpha_i * op(A) * op(B) + \beta_i * C)$ for group *i*.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine *gemm_batch* interface are the following:

a_array

Holds pointers to arrays containing matrices *A* of size (*ma,ka*) where

$ka = k$ if $transa = 'N'$,

$ka = m$ otherwise,

	$ma = m$ if $transa='N'$, $ma = k$ otherwise.
<code>b_array</code>	Holds pointers to arrays containing matrices B of size (mb, kb) where $kb = n$ if $transb_array = 'N'$, $kb = k$ otherwise, $mb = k$ if $transb_array = 'N'$, $mb = n$ otherwise.
<code>c_array</code>	Holds pointers to arrays containing matrices C of size (m, n) .
<code>m_array</code>	Array indicating number of rows of matrices $op(A)$ and C for each group.
<code>n_array</code>	Array indicating number of columns of matrices $op(B)$ and C for each group.
<code>k_array</code>	Array indicating number of rows of matrices $op(A)$ and number of columns of matrices $op(B)$ for each group.
<code>transa_array</code>	Array with each element set to one of 'N', 'C', or 'T'. The default values are 'N'.
<code>transb_array</code>	Array with each element set to one of 'N', 'C', or 'T'. The default values are 'N'.
<code>alpha_array</code>	Array of α values; the default value is 1.
<code>beta_array</code>	Array of β values; the default value is 0.

?herk

Performs a Hermitian rank- k update.

Syntax

```
call cherk(uplo, trans, n, k, alpha, a, lda, beta, c, ldc)
call zherk(uplo, trans, n, k, alpha, a, lda, beta, c, ldc)
call herk(a, c [,uplo] [, trans] [,alpha][,beta])
```

Include Files

- `mkl.fi`, `blas.f90`

Description

The ?herk routines perform a rank- k matrix-matrix operation using a general matrix A and a Hermitian matrix C . The operation is defined as

$$C := \alpha A A^H + \beta C,$$

or

$$C := \alpha A^H A + \beta C,$$

where:

alpha and *beta* are real scalars,

C is an *n*-by-*n* Hermitian matrix,

A is an *n*-by-*k* matrix in the first case and a *k*-by-*n* matrix in the second case.

Input Parameters

<i>uplo</i>	<p>CHARACTER*1. Specifies whether the upper or lower triangular part of the array <i>c</i> is used.</p> <p>If <i>uplo</i> = 'U' or 'u', then the upper triangular part of the array <i>c</i> is used.</p> <p>If <i>uplo</i> = 'L' or 'l', then the low triangular part of the array <i>c</i> is used.</p>
<i>trans</i>	<p>CHARACTER*1. Specifies the operation:</p> <p>if <i>trans</i>= 'N' or 'n', then $C := \alpha A A^H + \beta C$;</p> <p>if <i>trans</i>= 'C' or 'c', then $C := \alpha A^H A + \beta C$.</p>
<i>n</i>	<p>INTEGER. Specifies the order of the matrix <i>C</i>. The value of <i>n</i> must be at least zero.</p>
<i>k</i>	<p>INTEGER. With <i>trans</i>= 'N' or 'n', <i>k</i> specifies the number of columns of the matrix <i>A</i>, and with <i>trans</i>= 'C' or 'c', <i>k</i> specifies the number of rows of the matrix <i>A</i>.</p> <p>The value of <i>k</i> must be at least zero.</p>
<i>alpha</i>	<p>REAL for <i>cherk</i></p> <p>DOUBLE PRECISION for <i>zherk</i></p> <p>Specifies the scalar <i>alpha</i>.</p>
<i>a</i>	<p>COMPLEX for <i>cherk</i></p> <p>DOUBLE COMPLEX for <i>zherk</i></p> <p>Array, size (<i>lda</i>, <i>ka</i>), where <i>ka</i> is <i>k</i> when <i>trans</i>= 'N' or 'n', and is <i>n</i> otherwise. Before entry with <i>trans</i>= 'N' or 'n', the leading <i>n</i>-by-<i>k</i> part of the array <i>a</i> must contain the matrix <i>a</i>, otherwise the leading <i>k</i>-by-<i>n</i> part of the array <i>a</i> must contain the matrix <i>A</i>.</p>
<i>lda</i>	<p>INTEGER. Specifies the leading dimension of <i>a</i> as declared in the calling (sub)program. When <i>trans</i>= 'N' or 'n', then <i>lda</i> must be at least $\max(1, n)$, otherwise <i>lda</i> must be at least $\max(1, k)$.</p>
<i>beta</i>	<p>REAL for <i>cherk</i></p> <p>DOUBLE PRECISION for <i>zherk</i></p> <p>Specifies the scalar <i>beta</i>.</p>
<i>c</i>	<p>COMPLEX for <i>cherk</i></p> <p>DOUBLE COMPLEX for <i>zherk</i></p> <p>Array, size <i>ldc</i> by <i>n</i>.</p> <p>Before entry with <i>uplo</i> = 'U' or 'u', the leading <i>n</i>-by-<i>n</i> upper triangular part of the array <i>c</i> must contain the upper triangular part of the Hermitian matrix and the strictly lower triangular part of <i>c</i> is not referenced.</p>

Before entry with `uplo = 'L' or 'l'`, the leading n -by- n lower triangular part of the array `c` must contain the lower triangular part of the Hermitian matrix and the strictly upper triangular part of `c` is not referenced.

The imaginary parts of the diagonal elements need not be set, they are assumed to be zero.

`ldc`

INTEGER. Specifies the leading dimension of `c` as declared in the calling (sub)program. The value of `ldc` must be at least $\max(1, n)$.

Output Parameters

`c`

With `uplo = 'U' or 'u'`, the upper triangular part of the array `c` is overwritten by the upper triangular part of the updated matrix.

With `uplo = 'L' or 'l'`, the lower triangular part of the array `c` is overwritten by the lower triangular part of the updated matrix.

The imaginary parts of the diagonal elements are set to zero.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine `herk` interface are the following:

`a`

Holds the matrix A of size (ma,ka) where

$ka = k$ if `trans='N'`,

$ka = n$ otherwise,

$ma = n$ if `trans='N'`,

$ma = k$ otherwise.

`c`

Holds the matrix C of size (n,n) .

`uplo`

Must be `'U'` or `'L'`. The default value is `'U'`.

`trans`

Must be `'N'` or `'C'`. The default value is `'N'`.

`alpha`

The default value is 1.

`beta`

The default value is 0.

?her2k

Performs a Hermitian rank-2k update.

Syntax

```
call cher2k(uplo, trans, n, k, alpha, a, lda, b, ldb, beta, c, ldc)
```

```
call zher2k(uplo, trans, n, k, alpha, a, lda, b, ldb, beta, c, ldc)
```

```
call her2k(a, b, c [,uplo][,trans] [,alpha][,beta])
```

Include Files

- `mkl.fi`, `blas.f90`

Description

The `?her2k` routines perform a rank-2k matrix-matrix operation using general matrices A and B and a Hermitian matrix C . The operation is defined as

$$C := \alpha A B^H + \text{conjg}(\alpha) B^H A + \beta C,$$

or

$$C := \alpha A^H B + \text{conjg}(\alpha) B^H A + \beta C,$$

where:

α is a scalar and β is a real scalar,

C is an n -by- n Hermitian matrix,

A and B are n -by- k matrices in the first case and k -by- n matrices in the second case.

Input Parameters

<i>uplo</i>	<p>CHARACTER*1. Specifies whether the upper or lower triangular part of the array c is used.</p> <p>If <i>uplo</i> = 'U' or 'u', then the upper triangular of the array c is used.</p> <p>If <i>uplo</i> = 'L' or 'l', then the low triangular of the array c is used.</p>
<i>trans</i>	<p>CHARACTER*1. Specifies the operation:</p> <p>if <i>trans</i> = 'N' or 'n', then $C := \alpha A B^H + \alpha B A^H + \beta C$;</p> <p>if <i>trans</i> = 'C' or 'c', then $C := \alpha A^H B + \alpha B^H A + \beta C$.</p>
<i>n</i>	<p>INTEGER. Specifies the order of the matrix C. The value of n must be at least zero.</p>
<i>k</i>	<p>INTEGER. With <i>trans</i> = 'N' or 'n' specifies the number of columns of the matrix A, and with <i>trans</i> = 'C' or 'c', k specifies the number of rows of the matrix A.</p> <p>The value of k must be at least equal to zero.</p>
<i>alpha</i>	<p>COMPLEX for <code>cher2k</code></p> <p>DOUBLE COMPLEX for <code>zher2k</code></p> <p>Specifies the scalar α.</p>
<i>a</i>	<p>COMPLEX for <code>cher2k</code></p> <p>DOUBLE COMPLEX for <code>zher2k</code></p> <p>Array, size (lda, ka), where ka is k when <i>trans</i> = 'N' or 'n', and is n otherwise. Before entry with <i>trans</i> = 'N' or 'n', the leading n-by-k part of the array a must contain the matrix A, otherwise the leading k-by-n part of the array a must contain the matrix A.</p>
<i>lda</i>	<p>INTEGER. Specifies the leading dimension of a as declared in the calling (sub)program.</p>

When $trans = 'N'$ or $'n'$, then lda must be at least $\max(1, n)$, otherwise lda must be at least $\max(1, k)$.

β	<p>REAL for cher2k</p> <p>DOUBLE PRECISION for zher2k</p> <p>Specifies the scalar β.</p>
b	<p>COMPLEX for cher2k</p> <p>DOUBLE COMPLEX for zher2k</p> <p>Array, size (ldb, kb), where kb is k when $trans = 'N'$ or $'n'$, and is n otherwise. Before entry with $trans = 'N'$ or $'n'$, the leading n-by-k part of the array b must contain the matrix B, otherwise the leading k-by-n part of the array b must contain the matrix B.</p>
ldb	<p>INTEGER. Specifies the leading dimension of a as declared in the calling (sub)program.</p> <p>When $trans = 'N'$ or $'n'$, then ldb must be at least $\max(1, n)$, otherwise ldb must be at least $\max(1, k)$.</p>
c	<p>COMPLEX for cher2k</p> <p>DOUBLE COMPLEX for zher2k</p> <p>Array, size ldc by n.</p> <p>Before entry with $uplo = 'U'$ or $'u'$, the leading n-by-n upper triangular part of the array c must contain the upper triangular part of the Hermitian matrix and the strictly lower triangular part of c is not referenced.</p> <p>Before entry with $uplo = 'L'$ or $'l'$, the leading n-by-n lower triangular part of the array c must contain the lower triangular part of the Hermitian matrix and the strictly upper triangular part of c is not referenced.</p> <p>The imaginary parts of the diagonal elements need not be set, they are assumed to be zero.</p>
ldc	<p>INTEGER. Specifies the leading dimension of c as declared in the calling (sub)program. The value of ldc must be at least $\max(1, n)$.</p>

Output Parameters

c	<p>With $uplo = 'U'$ or $'u'$, the upper triangular part of the array c is overwritten by the upper triangular part of the updated matrix.</p> <p>With $uplo = 'L'$ or $'l'$, the lower triangular part of the array c is overwritten by the lower triangular part of the updated matrix.</p> <p>The imaginary parts of the diagonal elements are set to zero.</p>
-----	--

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine `her2k` interface are the following:

<i>a</i>	Holds the matrix <i>A</i> of size (<i>ma</i> , <i>ka</i>) where $ka = k$ if <i>trans</i> = 'N', $ka = n$ otherwise, $ma = n$ if <i>trans</i> = 'N', $ma = k$ otherwise.
<i>b</i>	Holds the matrix <i>B</i> of size (<i>mb</i> , <i>kb</i>) where $kb = k$ if <i>trans</i> = 'N', $kb = n$ otherwise, $mb = n$ if <i>trans</i> = 'N', $mb = k$ otherwise.
<i>c</i>	Holds the matrix <i>C</i> of size (<i>n</i> , <i>n</i>).
<i>uplo</i>	Must be 'U' or 'L'. The default value is 'U'.
<i>trans</i>	Must be 'N' or 'C'. The default value is 'N'.
<i>alpha</i>	The default value is 1.
<i>beta</i>	The default value is 0.

?symm

Computes a matrix-matrix product where one input matrix is symmetric.

Syntax

```
call ssymm(side, uplo, m, n, alpha, a, lda, b, ldb, beta, c, ldc)
call dsymm(side, uplo, m, n, alpha, a, lda, b, ldb, beta, c, ldc)
call csymm(side, uplo, m, n, alpha, a, lda, b, ldb, beta, c, ldc)
call zsymm(side, uplo, m, n, alpha, a, lda, b, ldb, beta, c, ldc)
call symm(a, b, c [,side][,uplo] [,alpha][,beta])
```

Include Files

- mkl.fi, blas.f90

Description

The ?symm routines compute a scalar-matrix-matrix product with one symmetric matrix and add the result to a scalar-matrix product. The operation is defined as

```
C := alpha*A*B + beta*C,
```

or

```
C := alpha*B*A + beta*C,
```

where:

alpha and *beta* are scalars,

A is a symmetric matrix,

B and C are m -by- n matrices.

Input Parameters

<i>side</i>	<p>CHARACTER*1. Specifies whether the symmetric matrix A appears on the left or right in the operation:</p> <p>if <i>side</i> = 'L' or 'l', then $C := \alpha * A * B + \beta * C$;</p> <p>if <i>side</i> = 'R' or 'r', then $C := \alpha * B * A + \beta * C$.</p>
<i>uplo</i>	<p>CHARACTER*1. Specifies whether the upper or lower triangular part of the symmetric matrix A is used:</p> <p>if <i>uplo</i> = 'U' or 'u', then the upper triangular part is used;</p> <p>if <i>uplo</i> = 'L' or 'l', then the lower triangular part is used.</p>
<i>m</i>	<p>INTEGER. Specifies the number of rows of the matrix C.</p> <p>The value of m must be at least zero.</p>
<i>n</i>	<p>INTEGER. Specifies the number of columns of the matrix C.</p> <p>The value of n must be at least zero.</p>
<i>alpha</i>	<p>REAL for ssymm</p> <p>DOUBLE PRECISION for dsymm</p> <p>COMPLEX for csymm</p> <p>DOUBLE COMPLEX for zsymm</p> <p>Specifies the scalar α.</p>
<i>a</i>	<p>REAL for ssymm</p> <p>DOUBLE PRECISION for dsymm</p> <p>COMPLEX for csymm</p> <p>DOUBLE COMPLEX for zsymm</p> <p>Array, size (lda, ka), where ka is m when <i>side</i> = 'L' or 'l' and is n otherwise.</p> <p>Before entry with <i>side</i> = 'L' or 'l', the m-by-m part of the array a must contain the symmetric matrix, such that when <i>uplo</i> = 'U' or 'u', the leading m-by-m upper triangular part of the array a must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of a is not referenced, and when <i>side</i> = 'L' or 'l', the leading m-by-m lower triangular part of the array a must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of a is not referenced.</p> <p>Before entry with <i>side</i> = 'R' or 'r', the n-by-n part of the array a must contain the symmetric matrix, such that when <i>uplo</i> = 'U' or 'u' the array a must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of a is not referenced, and when <i>side</i> = 'L' or 'l', the leading n-by-n lower triangular part of the array a must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of a is not referenced.</p>

<i>lda</i>	<p>INTEGER. Specifies the leading dimension of <i>a</i> as declared in the calling (sub)program. When <i>side</i> = 'L' or 'l' then <i>lda</i> must be at least $\max(1, m)$, otherwise <i>lda</i> must be at least $\max(1, n)$.</p>
<i>b</i>	<p>REAL for <i>ssymm</i></p> <p>DOUBLE PRECISION for <i>dsymm</i></p> <p>COMPLEX for <i>csymm</i></p> <p>DOUBLE COMPLEX for <i>zsymm</i></p> <p>Array, size <i>ldb</i> by <i>n</i>.</p> <p>The leading <i>m</i>-by-<i>n</i> part of the array <i>b</i> must contain the matrix <i>B</i>.</p>
<i>ldb</i>	<p>INTEGER. Specifies the leading dimension of <i>b</i> as declared in the calling (sub)program. <i>ldb</i> must be at least $\max(1, m)$.</p>
<i>beta</i>	<p>REAL for <i>ssymm</i></p> <p>DOUBLE PRECISION for <i>dsymm</i></p> <p>COMPLEX for <i>csymm</i></p> <p>DOUBLE COMPLEX for <i>zsymm</i></p> <p>Specifies the scalar <i>beta</i>.</p> <p>When <i>beta</i> is set to zero, then <i>c</i> need not be set on input.</p>
<i>c</i>	<p>REAL for <i>ssymm</i></p> <p>DOUBLE PRECISION for <i>dsymm</i></p> <p>COMPLEX for <i>csymm</i></p> <p>DOUBLE COMPLEX for <i>zsymm</i></p> <p>Array, size (c, n). Before entry, the leading <i>m</i>-by-<i>n</i> part of the array <i>c</i> must contain the matrix <i>C</i>, except when <i>beta</i> is zero, in which case <i>c</i> need not be set on entry.</p>
<i>ldc</i>	<p>INTEGER. Specifies the leading dimension of <i>c</i> as declared in the calling (sub)program. <i>ldc</i> must be at least $\max(1, m)$.</p>

Output Parameters

<i>c</i>	Overwritten by the <i>m</i> -by- <i>n</i> updated matrix.
----------	---

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine *ssymm* interface are the following:

<i>a</i>	<p>Holds the matrix <i>A</i> of size (k, k) where</p> <p>$k = m$ if <i>side</i> = 'L',</p> <p>$k = n$ otherwise.</p>
----------	---

<i>b</i>	Holds the matrix <i>B</i> of size (m,n) .
<i>c</i>	Holds the matrix <i>C</i> of size (m,n) .
<i>side</i>	Must be 'L' or 'R'. The default value is 'L'.
<i>uplo</i>	Must be 'U' or 'L'. The default value is 'U'.
<i>alpha</i>	The default value is 1.
<i>beta</i>	The default value is 0.

?syrk

Performs a symmetric rank-k update.

Syntax

```
call ssyrk(uplo, trans, n, k, alpha, a, lda, beta, c, ldc)
call dsyrk(uplo, trans, n, k, alpha, a, lda, beta, c, ldc)
call csyrk(uplo, trans, n, k, alpha, a, lda, beta, c, ldc)
call zsyrk(uplo, trans, n, k, alpha, a, lda, beta, c, ldc)
call syrk(a, c [,uplo] [, trans] [,alpha][,beta])
```

Include Files

- mkl.fi, blas.f90

Description

The ?syrk routines perform a rank-k matrix-matrix operation for a symmetric matrix *C* using a general matrix *A*. The operation is defined as

```
C := alpha*A*A' + beta*C,
```

or

```
C := alpha*A'*A + beta*C,
```

where:

alpha and *beta* are scalars,

C is an n -by- n symmetric matrix,

A is an n -by- k matrix in the first case and a k -by- n matrix in the second case.

Input Parameters

<i>uplo</i>	<p>CHARACTER*1. Specifies whether the upper or lower triangular part of the array <i>c</i> is used.</p> <p>If <i>uplo</i> = 'U' or 'u', then the upper triangular part of the array <i>c</i> is used.</p> <p>If <i>uplo</i> = 'L' or 'l', then the low triangular part of the array <i>c</i> is used.</p>
<i>trans</i>	<p>CHARACTER*1. Specifies the operation:</p> <p>if <i>trans</i>= 'N' or 'n', then $C := \alpha A A' + \beta C$;</p> <p>if <i>trans</i>= 'T' or 't', then $C := \alpha A' A + \beta C$;</p>

if $trans = 'C'$ or $'c'$, then $C := \alpha * A' * A + \beta * C$.

n	INTEGER. Specifies the order of the matrix C . The value of n must be at least zero.
k	<p>INTEGER. On entry with $trans = 'N'$ or $'n'$, k specifies the number of columns of the matrix a, and on entry with $trans = 'T'$, $'t'$, $'C'$, or $'c'$, k specifies the number of rows of the matrix a.</p> <p>The value of k must be at least zero.</p>
α	<p>REAL for ssyrk</p> <p>DOUBLE PRECISION for dsyrk</p> <p>COMPLEX for csyrk</p> <p>DOUBLE COMPLEX for zsyrk</p> <p>Specifies the scalar α.</p>
a	<p>REAL for ssyrk</p> <p>DOUBLE PRECISION for dsyrk</p> <p>COMPLEX for csyrk</p> <p>DOUBLE COMPLEX for zsyrk</p> <p>Array, size (lda, ka), where ka is k when $trans = 'N'$ or $'n'$, and is n otherwise. Before entry with $trans = 'N'$ or $'n'$, the leading n-by-k part of the array a must contain the matrix A, otherwise the leading k-by-n part of the array a must contain the matrix A.</p> <p>Array, size (lda, ka), where ka is k when $trans = 'N'$ or $'n'$, and is n otherwise. Before entry with $trans = 'N'$ or $'n'$, the leading n-by-k part of the array a must contain the matrix a, otherwise the leading k-by-n part of the array a must contain the matrix A.</p>
lda	INTEGER. Specifies the leading dimension of a as declared in the calling (sub)program. When $trans = 'N'$ or $'n'$, then lda must be at least $\max(1, n)$, otherwise lda must be at least $\max(1, k)$.
β	<p>REAL for ssyrk</p> <p>DOUBLE PRECISION for dsyrk</p> <p>COMPLEX for csyrk</p> <p>DOUBLE COMPLEX for zsyrk</p> <p>Specifies the scalar β.</p>
c	<p>REAL for ssyrk</p> <p>DOUBLE PRECISION for dsyrk</p> <p>COMPLEX for csyrk</p> <p>DOUBLE COMPLEX for zsyrk</p>

Array, size (ldc, n) . Before entry with $uplo = 'U'$ or $'u'$, the leading n -by- n upper triangular part of the array c must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of c is not referenced.

Before entry with $uplo = 'L'$ or $'l'$, the leading n -by- n lower triangular part of the array c must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of c is not referenced.

ldc

INTEGER. Specifies the leading dimension of c as declared in the calling (sub)program. The value of ldc must be at least $\max(1, n)$.

Output Parameters

c

With $uplo = 'U'$ or $'u'$, the upper triangular part of the array c is overwritten by the upper triangular part of the updated matrix.

With $uplo = 'L'$ or $'l'$, the lower triangular part of the array c is overwritten by the lower triangular part of the updated matrix.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine `syrk` interface are the following:

a

Holds the matrix A of size (ma, ka) where

$ka = k$ if $transa='N'$,

$ka = n$ otherwise,

$ma = n$ if $transa='N'$,

$ma = k$ otherwise.

c

Holds the matrix C of size (n, n) .

uplo

Must be $'U'$ or $'L'$. The default value is $'U'$.

trans

Must be $'N'$, $'C'$, or $'T'$.

The default value is $'N'$.

alpha

The default value is 1.

beta

The default value is 0.

?syr2k

Performs a symmetric rank-2k update.

Syntax

```
call ssyr2k(uplo, trans, n, k, alpha, a, lda, b, ldb, beta, c, ldc)
```

```
call dsyr2k(uplo, trans, n, k, alpha, a, lda, b, ldb, beta, c, ldc)
```

```
call csyr2k(uplo, trans, n, k, alpha, a, lda, b, ldb, beta, c, ldc)
```

```
call zsyr2k(uplo, trans, n, k, alpha, a, lda, b, ldb, beta, c, ldc)
call syr2k(a, b, c [,uplo][,trans] [,alpha][,beta])
```

Include Files

- mkl.fi, blas.f90

Description

The ?syr2k routines perform a rank-2k matrix-matrix operation for a symmetric matrix C using general matrices A and B . The operation is defined as

$$C := \alpha A A^T + \alpha B B^T + \beta C,$$

or

$$C := \alpha A^T A + \alpha B^T B + \beta C,$$

where:

α and β are scalars,

C is an n -by- n symmetric matrix,

A and B are n -by- k matrices in the first case, and k -by- n matrices in the second case.

Input Parameters

<i>uplo</i>	<p>CHARACTER*1. Specifies whether the upper or lower triangular part of the array c is used.</p> <p>If <i>uplo</i> = 'U' or 'u', then the upper triangular part of the array c is used.</p> <p>If <i>uplo</i> = 'L' or 'l', then the low triangular part of the array c is used.</p>
<i>trans</i>	<p>CHARACTER*1. Specifies the operation:</p> <p>if <i>trans</i>= 'N' or 'n', then $C := \alpha A A^T + \alpha B B^T + \beta C$;</p> <p>if <i>trans</i>= 'T' or 't', then $C := \alpha A^T A + \alpha B^T B + \beta C$;</p> <p>if <i>trans</i>= 'C' or 'c', then $C := \alpha A A^T + \alpha B B^T + \beta C$.</p>
<i>n</i>	<p>INTEGER. Specifies the order of the matrix C. The value of n must be at least zero.</p>
<i>k</i>	<p>INTEGER. On entry with <i>trans</i>= 'N' or 'n', k specifies the number of columns of the matrices A and B, and on entry with <i>trans</i>= 'T' or 't' or 'C' or 'c', k specifies the number of rows of the matrices A and B. The value of k must be at least zero.</p>
<i>alpha</i>	<p>REAL for ssyr2k</p> <p>DOUBLE PRECISION for dsyr2k</p> <p>COMPLEX for csyr2k</p> <p>DOUBLE COMPLEX for zsyr2k</p> <p>Specifies the scalar α.</p>
<i>a</i>	<p>REAL for ssyr2k</p> <p>DOUBLE PRECISION for dsyr2k</p>

COMPLEX for csyr2k

DOUBLE COMPLEX for zsyr2k

Array, size (lda, ka) , where ka is k when $trans = 'N'$ or $'n'$, and is n otherwise. Before entry with $trans = 'N'$ or $'n'$, the leading n -by- k part of the array a must contain the matrix A , otherwise the leading k -by- n part of the array a must contain the matrix A .

lda

INTEGER. Specifies the leading dimension of a as declared in the calling (sub)program.

When $trans = 'N'$ or $'n'$, then lda must be at least $\max(1, n)$, otherwise lda must be at least $\max(1, k)$.

b

REAL for ssyr2k

DOUBLE PRECISION for dsyr2k

COMPLEX for csyr2k

DOUBLE COMPLEX for zsyr2k

Array, size (ldb, kb) , where kb is k when $trans = 'N'$ or $'n'$, and is n otherwise. Before entry with $trans = 'N'$ or $'n'$, the leading n -by- k part of the array b must contain the matrix B , otherwise the leading k -by- n part of the array b must contain the matrix B .

ldb

INTEGER. Specifies the leading dimension of a as declared in the calling (sub)program.

When $trans = 'N'$ or $'n'$, then ldb must be at least $\max(1, n)$, otherwise ldb must be at least $\max(1, k)$.

beta

REAL for ssyr2k

DOUBLE PRECISION for dsyr2k

COMPLEX for csyr2k

DOUBLE COMPLEX for zsyr2k

Specifies the scalar β .

c

REAL for ssyr2k

DOUBLE PRECISION for dsyr2k

COMPLEX for csyr2k

DOUBLE COMPLEX for zsyr2k

Array, size (ldc, n) . Before entry with $uplo = 'U'$ or $'u'$, the leading n -by- n upper triangular part of the array c must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of c is not referenced.

Before entry with $uplo = 'L'$ or $'l'$, the leading n -by- n lower triangular part of the array c must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of c is not referenced.

ldc

INTEGER. Specifies the leading dimension of c as declared in the calling (sub)program. The value of ldc must be at least $\max(1, n)$.

Output Parameters

c With *uplo* = 'U' or 'u', the upper triangular part of the array *c* is overwritten by the upper triangular part of the updated matrix.
With *uplo* = 'L' or 'l', the lower triangular part of the array *c* is overwritten by the lower triangular part of the updated matrix.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine `syr2k` interface are the following:

<i>a</i>	Holds the matrix <i>A</i> of size (<i>ma,ka</i>) where <i>ka</i> = <i>k</i> if <i>trans</i> = 'N', <i>ka</i> = <i>n</i> otherwise, <i>ma</i> = <i>n</i> if <i>trans</i> = 'N', <i>ma</i> = <i>k</i> otherwise.
<i>b</i>	Holds the matrix <i>B</i> of size (<i>mb,kb</i>) where <i>kb</i> = <i>k</i> if <i>trans</i> = 'N', <i>kb</i> = <i>n</i> otherwise, <i>mb</i> = <i>n</i> if <i>trans</i> = 'N', <i>mb</i> = <i>k</i> otherwise.
<i>c</i>	Holds the matrix <i>C</i> of size (<i>n,n</i>).
<i>uplo</i>	Must be 'U' or 'L'. The default value is 'U'.
<i>trans</i>	Must be 'N', 'C', or 'T'. The default value is 'N'.
<i>alpha</i>	The default value is 1.
<i>beta</i>	The default value is 0.

?trmm

Computes a matrix-matrix product where one input matrix is triangular.

Syntax

```
call strmm(side, uplo, transa, diag, m, n, alpha, a, lda, b, ldb)
call dtrmm(side, uplo, transa, diag, m, n, alpha, a, lda, b, ldb)
call ctrmm(side, uplo, transa, diag, m, n, alpha, a, lda, b, ldb)
call ztrmm(side, uplo, transa, diag, m, n, alpha, a, lda, b, ldb)
call trmm(a, b [,side] [, uplo] [,transa][,diag] [,alpha])
```

Include Files

- `mkl.fi`, `blas.f90`

Description

The `?trmm` routines compute a scalar-matrix-matrix product with one triangular matrix. The operation is defined as

```
 $B := \alpha * \text{op}(A) * B$ 
```

or

```
 $B := \alpha * B * \text{op}(A)$ 
```

where:

α is a scalar,

B is an m -by- n matrix,

A is a unit, or non-unit, upper or lower triangular matrix

$\text{op}(A)$ is one of $\text{op}(A) = A$, or $\text{op}(A) = A'$, or $\text{op}(A) = \text{conjg}(A')$.

Input Parameters

<i>side</i>	<p>CHARACTER*1. Specifies whether $\text{op}(A)$ appears on the left or right of B in the operation:</p> <p>if <i>side</i> = 'L' or 'l', then $B := \alpha * \text{op}(A) * B$;</p> <p>if <i>side</i> = 'R' or 'r', then $B := \alpha * B * \text{op}(A)$.</p>
<i>uplo</i>	<p>CHARACTER*1. Specifies whether the matrix A is upper or lower triangular:</p> <p><i>uplo</i> = 'U' or 'u'</p> <p>if <i>uplo</i> = 'L' or 'l', then the matrix is low triangular.</p>
<i>transa</i>	<p>CHARACTER*1. Specifies the form of $\text{op}(A)$ used in the matrix multiplication:</p> <p>if <i>transa</i> = 'N' or 'n', then $\text{op}(A) = A$;</p> <p>if <i>transa</i> = 'T' or 't', then $\text{op}(A) = A'$;</p> <p>if <i>transa</i> = 'C' or 'c', then $\text{op}(A) = \text{conjg}(A')$.</p>
<i>diag</i>	<p>CHARACTER*1. Specifies whether the matrix A is unit triangular:</p> <p>if <i>diag</i> = 'U' or 'u' then the matrix is unit triangular;</p> <p>if <i>diag</i> = 'N' or 'n', then the matrix is not unit triangular.</p>
<i>m</i>	<p>INTEGER. Specifies the number of rows of B. The value of m must be at least zero.</p>
<i>n</i>	<p>INTEGER. Specifies the number of columns of B. The value of n must be at least zero.</p>
<i>alpha</i>	<p>REAL for <code>strmm</code></p> <p>DOUBLE PRECISION for <code>dtrmm</code></p> <p>COMPLEX for <code>ctrmm</code></p>

DOUBLE COMPLEX for `ztrmm`

Specifies the scalar *alpha*.

When *alpha* is zero, then *a* is not referenced and *b* need not be set before entry.

a

REAL for `strmm`

DOUBLE PRECISION for `dtrmm`

COMPLEX for `ctrmm`

DOUBLE COMPLEX for `ztrmm`

Array, size *lda* by *k*, where *k* is *m* when *side* = 'L' or 'l' and is *n* when *side* = 'R' or 'r'. Before entry with *uplo* = 'U' or 'u', the leading *k* by *k* upper triangular part of the array *a* must contain the upper triangular matrix and the strictly lower triangular part of *a* is not referenced.

Before entry with *uplo* = 'L' or 'l', the leading *k* by *k* lower triangular part of the array *a* must contain the lower triangular matrix and the strictly upper triangular part of *a* is not referenced.

When *diag* = 'U' or 'u', the diagonal elements of *a* are not referenced either, but are assumed to be unity.

lda

INTEGER. Specifies the leading dimension of *a* as declared in the calling (sub)program. When *side* = 'L' or 'l', then *lda* must be at least $\max(1, m)$, when *side* = 'R' or 'r', then *lda* must be at least $\max(1, n)$.

b

REAL for `strmm`

DOUBLE PRECISION for `dtrmm`

COMPLEX for `ctrmm`

DOUBLE COMPLEX for `ztrmm`

Array, size *ldb* by *n*. Before entry, the leading *m*-by-*n* part of the array *b* must contain the matrix *B*.

ldb

INTEGER. Specifies the leading dimension of *b* as declared in the calling (sub)program. *ldb* must be at least $\max(1, m)$.

Output Parameters

b

Overwritten by the transformed matrix.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine `trmm` interface are the following:

a

Holds the matrix *A* of size (*k*,*k*) where

k = *m* if *side* = 'L',

k = *n* otherwise.

<i>b</i>	Holds the matrix <i>B</i> of size (m,n) .
<i>side</i>	Must be 'L' or 'R'. The default value is 'L'.
<i>uplo</i>	Must be 'U' or 'L'. The default value is 'U'.
<i>transa</i>	Must be 'N', 'C', or 'T'. The default value is 'N'.
<i>diag</i>	Must be 'N' or 'U'. The default value is 'N'.
<i>alpha</i>	The default value is 1.

?trsm

Solves a triangular matrix equation.

Syntax

```
call strsm(side, uplo, transa, diag, m, n, alpha, a, lda, b, ldb)
call dtrsm(side, uplo, transa, diag, m, n, alpha, a, lda, b, ldb)
call ctrsm(side, uplo, transa, diag, m, n, alpha, a, lda, b, ldb)
call ztrsm(side, uplo, transa, diag, m, n, alpha, a, lda, b, ldb)
call trsm(a, b [,side] [, uplo] [,transa][,diag] [,alpha])
```

Include Files

- mkl.fi, blas.f90

Description

The ?trsm routines solve one of the following matrix equations:

$\text{op}(A) * X = \alpha * B,$

or

$X * \text{op}(A) = \alpha * B,$

where:

alpha is a scalar,

X and *B* are *m*-by-*n* matrices,

A is a unit, or non-unit, upper or lower triangular matrix

op(*A*) is one of *op*(*A*) = *A*, or *op*(*A*) = *A'*, or *op*(*A*) = *conjg*(*A'*).

The matrix *B* is overwritten by the solution matrix *X*.

Input Parameters

side CHARACTER*1. Specifies whether *op*(*A*) appears on the left or right of *X* in the equation:
 if *side* = 'L' or 'l', then $\text{op}(A) * X = \alpha * B;$
 if *side* = 'R' or 'r', then $X * \text{op}(A) = \alpha * B.$

<i>uplo</i>	<p>CHARACTER*1. Specifies whether the matrix <i>A</i> is upper or lower triangular:</p> <p><i>uplo</i> = 'U' or 'u'</p> <p>if <i>uplo</i> = 'L' or 'l', then the matrix is low triangular.</p>
<i>transa</i>	<p>CHARACTER*1. Specifies the form of $\text{op}(A)$ used in the matrix multiplication:</p> <p>if <i>transa</i> = 'N' or 'n', then $\text{op}(A) = A$;</p> <p>if <i>transa</i> = 'T' or 't';</p> <p>if <i>transa</i> = 'C' or 'c', then $\text{op}(A) = \text{conjg}(A)$.</p>
<i>diag</i>	<p>CHARACTER*1. Specifies whether the matrix <i>A</i> is unit triangular:</p> <p>if <i>diag</i> = 'U' or 'u' then the matrix is unit triangular;</p> <p>if <i>diag</i> = 'N' or 'n', then the matrix is not unit triangular.</p>
<i>m</i>	<p>INTEGER. Specifies the number of rows of <i>B</i>. The value of <i>m</i> must be at least zero.</p>
<i>n</i>	<p>INTEGER. Specifies the number of columns of <i>B</i>. The value of <i>n</i> must be at least zero.</p>
<i>alpha</i>	<p>REAL for <i>strsm</i></p> <p>DOUBLE PRECISION for <i>dtrsm</i></p> <p>COMPLEX for <i>ctrsm</i></p> <p>DOUBLE COMPLEX for <i>ztrsm</i></p> <p>Specifies the scalar <i>alpha</i>.</p> <p>When <i>alpha</i> is zero, then <i>a</i> is not referenced and <i>b</i> need not be set before entry.</p>
<i>a</i>	<p>REAL for <i>strsm</i></p> <p>DOUBLE PRECISION for <i>dtrsm</i></p> <p>COMPLEX for <i>ctrsm</i></p> <p>DOUBLE COMPLEX for <i>ztrsm</i></p> <p>Array, size (<i>lda</i>, <i>k</i>), where <i>k</i> is <i>m</i> when <i>side</i> = 'L' or 'l' and is <i>n</i> when <i>side</i> = 'R' or 'r'. Before entry with <i>uplo</i> = 'U' or 'u', the leading <i>k</i> by <i>k</i> upper triangular part of the array <i>a</i> must contain the upper triangular matrix and the strictly lower triangular part of <i>a</i> is not referenced.</p> <p>Before entry with <i>uplo</i> = 'L' or 'l' lower triangular part of the array <i>a</i> must contain the lower triangular matrix and the strictly upper triangular part of <i>a</i> is not referenced.</p> <p>When <i>diag</i> = 'U' or 'u', the diagonal elements of <i>a</i> are not referenced either, but are assumed to be unity.</p>
<i>lda</i>	<p>INTEGER. Specifies the leading dimension of <i>a</i> as declared in the calling (sub)program. When <i>side</i> = 'L' or 'l', then <i>lda</i> must be at least $\max(1, m)$, when <i>side</i> = 'R' or 'r', then <i>lda</i> must be at least $\max(1, n)$.</p>

<i>b</i>	REAL for <code>strsm</code> DOUBLE PRECISION for <code>dtrsm</code> COMPLEX for <code>ctrsm</code> DOUBLE COMPLEX for <code>ztrsm</code> Array, size <i>ldb</i> by <i>n</i> . Before entry, the leading <i>m</i> -by- <i>n</i> part of the array <i>b</i> must contain the matrix <i>B</i> .
<i>ldb</i>	INTEGER. Specifies the leading dimension of <i>b</i> as declared in the calling (sub)program. <i>ldb</i> must be at least $\max(1, m)$.

Output Parameters

<i>b</i>	Overwritten by the solution matrix <i>X</i> .
----------	---

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine `trsm` interface are the following:

<i>a</i>	Holds the matrix <i>A</i> of size (k,k) where $k = m$ if <i>side</i> = 'L', $k = n$ otherwise.
<i>b</i>	Holds the matrix <i>B</i> of size (m,n) .
<i>side</i>	Must be 'L' or 'R'. The default value is 'L'.
<i>uplo</i>	Must be 'U' or 'L'. The default value is 'U'.
<i>transa</i>	Must be 'N', 'C', or 'T'. The default value is 'N'.
<i>diag</i>	Must be 'N' or 'U'. The default value is 'N'.
<i>alpha</i>	The default value is 1.

Sparse BLAS Level 1 Routines

This section describes Sparse BLAS Level 1, an extension of BLAS Level 1 included in the Intel® Math Kernel Library beginning with the Intel MKL release 2.1. Sparse BLAS Level 1 is a group of routines and functions that perform a number of common vector operations on sparse vectors stored in compressed form.

Sparse vectors are those in which the majority of elements are zeros. Sparse BLAS routines and functions are specially implemented to take advantage of vector sparsity. This allows you to achieve large savings in computer time and memory. If *nz* is the number of non-zero vector elements, the computer time taken by Sparse BLAS operations will be $O(nz)$.

Vector Arguments

Compressed sparse vectors. Let a be a vector stored in an array, and assume that the only non-zero elements of a are the following:

$$a(k_1), a(k_2), a(k_3) \dots a(k_{nz}),$$

where nz is the total number of non-zero elements in a .

In Sparse BLAS, this vector can be represented in compressed form by two arrays, x (values) and $indx$ (indices). Each array has nz elements:

$$x(1)=a(k_1), x(2)=a(k_2), \dots x(nz)=a(k_{nz}),$$

$$indx(1)=k_1, indx(2)=k_2, \dots indx(nz)=k_{nz}.$$

Thus, a sparse vector is fully determined by the triple $(nz, x, indx)$. If you pass a negative or zero value of nz to Sparse BLAS, the subroutines do not modify any arrays or variables.

Full-storage vectors. Sparse BLAS routines can also use a vector argument fully stored in a single array (a full-storage vector). If y is a full-storage vector, its elements must be stored contiguously: the first element in $y(1)$, the second in $y(2)$, and so on. This corresponds to an increment $incy = 1$ in BLAS Level 1. No increment value for full-storage vectors is passed as an argument to Sparse BLAS routines or functions.

Naming Conventions

Similar to BLAS, the names of Sparse BLAS subprograms have prefixes that determine the data type involved: s and d for single- and double-precision real; c and z for single- and double-precision complex respectively.

If a Sparse BLAS routine is an extension of a "dense" one, the subprogram name is formed by appending the suffix i (standing for *indexed*) to the name of the corresponding "dense" subprogram. For example, the Sparse BLAS routine `saxpyi` corresponds to the BLAS routine `saxpy`, and the Sparse BLAS function `cdotci` corresponds to the BLAS function `cdotc`.

Routines and Data Types

Routines and data types supported in the Intel MKL implementation of Sparse BLAS are listed in [Table "Sparse BLAS Routines and Their Data Types"](#).

Sparse BLAS Routines and Their Data Types

Routine/ Function	Data Types	Description
<code>?axpyi</code>	s, d, c, z	Scalar-vector product plus vector (routines)
<code>?doti</code>	s, d	Dot product (functions)
<code>?dotci</code>	c, z	Complex dot product conjugated (functions)
<code>?dotui</code>	c, z	Complex dot product unconjugated (functions)
<code>?gthr</code>	s, d, c, z	Gathering a full-storage sparse vector into compressed form $nz, x, indx$ (routines)
<code>?gthrz</code>	s, d, c, z	Gathering a full-storage sparse vector into compressed form and assigning zeros to gathered elements in the full-storage vector (routines)
<code>?roti</code>	s, d	Givens rotation (routines)

Routine/ Function	Data Types	Description
<code>?sctr</code>	s, d, c, z	Scattering a vector from compressed form to full-storage form (routines)

BLAS Level 1 Routines That Can Work With Sparse Vectors

The following BLAS Level 1 routines will give correct results when you pass to them a compressed-form array x (with the increment `incx=1`):

<code>?asum</code>	sum of absolute values of vector elements
<code>?copy</code>	copying a vector
<code>?nrm2</code>	Euclidean norm of a vector
<code>?scal</code>	scaling a vector
<code>i?amax</code>	index of the element with the largest absolute value for real flavors, or the largest sum $ \operatorname{Re}(x(i)) + \operatorname{Im}(x(i)) $ for complex flavors.
<code>i?amin</code>	index of the element with the smallest absolute value for real flavors, or the smallest sum $ \operatorname{Re}(x(i)) + \operatorname{Im}(x(i)) $ for complex flavors.

The result i returned by `i?amax` and `i?amin` should be interpreted as index in the compressed-form array, so that the largest (smallest) value is $x(i)$; the corresponding index in full-storage array is `indx(i)`.

You can also call `?rotg` to compute the parameters of Givens rotation and then pass these parameters to the Sparse BLAS routines `?roti`.

`?axpyi`

Adds a scalar multiple of compressed sparse vector to a full-storage vector.

Syntax

```
call saxpyi(nz, a, x, indx, y)
call daxpyi(nz, a, x, indx, y)
call caxpyi(nz, a, x, indx, y)
call zaxpyi(nz, a, x, indx, y)
call axpyi(x, indx, y [, a])
```

Include Files

- `mk1.fi`, `blas.f90`

Description

The `?axpyi` routines perform a vector-vector operation defined as

```
y := a*x + y
```

where:

a is a scalar,

x is a sparse vector stored in compressed form,

y is a vector in full storage form.

The `?axpyi` routines reference or modify only the elements of y whose indices are listed in the array $indx$.

The values in $indx$ must be distinct.

Input Parameters

nz	INTEGER. The number of elements in x and $indx$.
a	REAL for <code>saxpyi</code> DOUBLE PRECISION for <code>daxpyi</code> COMPLEX for <code>caxpyi</code> DOUBLE COMPLEX for <code>zaxpyi</code> Specifies the scalar a .
x	REAL for <code>saxpyi</code> DOUBLE PRECISION for <code>daxpyi</code> COMPLEX for <code>caxpyi</code> DOUBLE COMPLEX for <code>zaxpyi</code> Array, size at least nz .
$indx$	INTEGER. Specifies the indices for the elements of x . Array, size at least nz .
y	REAL for <code>saxpyi</code> DOUBLE PRECISION for <code>daxpyi</code> COMPLEX for <code>caxpyi</code> DOUBLE COMPLEX for <code>zaxpyi</code> Array, size at least $\max(indx(i))$.

Output Parameters

y	Contains the updated vector y .
-----	-----------------------------------

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine `axpyi` interface are the following:

x	Holds the vector with the number of elements nz .
$indx$	Holds the vector with the number of elements nz .
y	Holds the vector with the number of elements nz .
a	The default value is 1.

?doti

Computes the dot product of a compressed sparse real vector by a full-storage real vector.

Syntax

```

res = sdoti(nz, x, indx, y )
res = ddoti(nz, x, indx, y )
res = doti(x, indx, y)

```

Include Files

- mkl.fi, blas.f90

Description

The ?doti routines return the dot product of x and y defined as

```
res = x(1)*y(indx(1)) + x(2)*y(indx(2)) + ... + x(nz)*y(indx(nz))
```

where the triple $(nz, x, indx)$ defines a sparse real vector stored in compressed form, and y is a real vector in full storage form. The functions reference only the elements of y whose indices are listed in the array $indx$. The values in $indx$ must be distinct.

Input Parameters

nz	INTEGER. The number of elements in x and $indx$.
x	REAL for sdoti DOUBLE PRECISION for ddoti Array, size at least nz .
$indx$	INTEGER. Specifies the indices for the elements of x . Array, size at least nz .
y	REAL for sdoti DOUBLE PRECISION for ddoti Array, size at least $\max(indx(i))$.

Output Parameters

res	REAL for sdoti DOUBLE PRECISION for ddoti Contains the dot product of x and y , if nz is positive. Otherwise, res contains 0.
-------	---

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine `doti` interface are the following:

<code>x</code>	Holds the vector with the number of elements <code>nz</code> .
<code>indx</code>	Holds the vector with the number of elements <code>nz</code> .
<code>y</code>	Holds the vector with the number of elements <code>nz</code> .

?dotci

Computes the conjugated dot product of a compressed sparse complex vector with a full-storage complex vector.

Syntax

```
res = cdotci(nz, x, indx, y)
```

```
res = zdotci(nzz, x, indx, y)
```

```
res = dotci(x, indx, y)
```

Include Files

- `mkl.fi`, `blas.f90`

Description

The `?dotci` routines return the dot product of `x` and `y` defined as

```
conjg(x(1))*y(indx(1)) + ... + conjg(x(nz))*y(indx(nz))
```

where the triple (`nz`, `x`, `indx`) defines a sparse complex vector stored in compressed form, and `y` is a real vector in full storage form. The functions reference only the elements of `y` whose indices are listed in the array `indx`. The values in `indx` must be distinct.

Input Parameters

<code>nz</code>	INTEGER. The number of elements in <code>x</code> and <code>indx</code> .
<code>x</code>	COMPLEX for <code>cdotci</code> DOUBLE COMPLEX for <code>zdotci</code> Array, size at least <code>nz</code> .
<code>indx</code>	INTEGER. Specifies the indices for the elements of <code>x</code> . Array, size at least <code>nz</code> .
<code>y</code>	COMPLEX for <code>cdotci</code> DOUBLE COMPLEX for <code>zdotci</code> Array, size at least <code>max(indx(i))</code> .

Output Parameters

<code>res</code>	COMPLEX for <code>cdotci</code> DOUBLE COMPLEX for <code>zdotci</code>
------------------	---

Contains the conjugated dot product of x and y , if nz is positive. Otherwise, it contains 0.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine `dotci` interface are the following:

x	Holds the vector with the number of elements (nz).
$indx$	Holds the vector with the number of elements (nz).
y	Holds the vector with the number of elements (nz).

?dotui

Computes the dot product of a compressed sparse complex vector by a full-storage complex vector.

Syntax

```
res = cdotui(nz, x, indx, y )
res = zdotui(nzz, x, indx, y )
res = dotui(x, indx, y)
```

Include Files

- `mkl.fi, blas.f90`

Description

The `?dotui` routines return the dot product of x and y defined as

```
res = x(1)*y(indx(1)) + x(2)*y(indx(2)) + ... + x(nz)*y(indx(nz))
```

where the triple $(nz, x, indx)$ defines a sparse complex vector stored in compressed form, and y is a real vector in full storage form. The functions reference only the elements of y whose indices are listed in the array $indx$. The values in $indx$ must be distinct.

Input Parameters

nz	INTEGER. The number of elements in x and $indx$.
x	COMPLEX for <code>cdotui</code> DOUBLE COMPLEX for <code>zdotui</code> Array, size at least nz .
$indx$	INTEGER. Specifies the indices for the elements of x . Array, size at least nz .
y	COMPLEX for <code>cdotui</code> DOUBLE COMPLEX for <code>zdotui</code>

Array, size at least $\max(\text{indx}(i))$.

Output Parameters

res COMPLEX for `cdotui`
 DOUBLE COMPLEX for `zdotui`
 Contains the dot product of *x* and *y*, if *nz* is positive. Otherwise, *res* contains 0.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine `dotui` interface are the following:

x Holds the vector with the number of elements *nz*.
indx Holds the vector with the number of elements *nz*.
y Holds the vector with the number of elements *nz*.

?gthr

Gathers a full-storage sparse vector's elements into compressed form.

Syntax

```
call sgthr(nz, y, x, indx )
call dgthr(nz, y, x, indx )
call cgthr(nz, y, x, indx )
call zgthr(nz, y, x, indx )
res = gthr(x, indx, y)
```

Include Files

- `mkl.fi, blas.f90`

Description

The `?gthr` routines gather the specified elements of a full-storage sparse vector *y* into compressed form(*nz*, *x*, *indx*). The routines reference only the elements of *y* whose indices are listed in the array *indx*:

$x(i) = y(\text{indx}(i))$, for $i=1, 2, \dots, nz$.

Input Parameters

nz INTEGER. The number of elements of *y* to be gathered.
indx INTEGER. Specifies indices of elements to be gathered.
 Array, size at least *nz*.

y REAL for sgthr
 DOUBLE PRECISION for dgthr
 COMPLEX for cgthr
 DOUBLE COMPLEX for zgthr
 Array, size at least $\max(\text{indx}(i))$.

Output Parameters

x REAL for sgthr
 DOUBLE PRECISION for dgthr
 COMPLEX for cgthr
 DOUBLE COMPLEX for zgthr
 Array, size at least *nz*.
 Contains the vector converted to the compressed form.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine `gthr` interface are the following:

x Holds the vector with the number of elements *nz*.
indx Holds the vector with the number of elements *nz*.
y Holds the vector with the number of elements *nz*.

?gthrz

Gathers a sparse vector's elements into compressed form, replacing them by zeros.

Syntax

```
call sgthrz(nz, y, x, indx )
call dgthrz(nz, y, x, indx )
call cgthrz(nz, y, x, indx )
call zgthrz(nz, y, x, indx )
res = gthrz(x, indx, y)
```

Include Files

- `mkl.fi, blas.f90`

Description

The `?gthrz` routines gather the elements with indices specified by the array *indx* from a full-storage vector *y* into compressed form (*nz*, *x*, *indx*) and overwrite the gathered elements of *y* by zeros. Other elements of *y* are not referenced or modified (see also [?gthr](#)).

Input Parameters

<i>nz</i>	INTEGER. The number of elements of <i>y</i> to be gathered.
<i>indx</i>	INTEGER. Specifies indices of elements to be gathered. Array, size at least <i>nz</i> .
<i>y</i>	REAL for sgthrz DOUBLE PRECISION for dgthrz COMPLEX for cgthrz DOUBLE COMPLEX for zgthrz Array, size at least $\max(indx(i))$.

Output Parameters

<i>x</i>	REAL for sgthrz DOUBLE PRECISION for dgthrz COMPLEX for cgthrz DOUBLE COMPLEX for zgthrz Array, size at least <i>nz</i> . Contains the vector converted to the compressed form.
<i>y</i>	The updated vector <i>y</i> .

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine *gthrz* interface are the following:

<i>x</i>	Holds the vector with the number of elements <i>nz</i> .
<i>indx</i>	Holds the vector with the number of elements <i>nz</i> .
<i>y</i>	Holds the vector with the number of elements <i>nz</i> .

?roti

Applies Givens rotation to sparse vectors one of which is in compressed form.

Syntax

```
call sroti(nz, x, indx, y, c, s)
call droti(nz, x, indx, y, c, s)
call roti(x, indx, y, c, s)
```

Include Files

- `mkl.fi`, `blas.f90`

Description

The `?roti` routines apply the Givens rotation to elements of two real vectors, x (in compressed form nz , x , $indx$) and y (in full storage form):

$$x(i) = c*x(i) + s*y(indx(i))$$

$$y(indx(i)) = c*y(indx(i)) - s*x(i)$$

The routines reference only the elements of y whose indices are listed in the array $indx$. The values in $indx$ must be distinct.

Input Parameters

nz	INTEGER. The number of elements in x and $indx$.
x	REAL for <code>sroti</code> DOUBLE PRECISION for <code>droti</code> Array, size at least nz .
$indx$	INTEGER. Specifies the indices for the elements of x . Array, size at least nz .
y	REAL for <code>sroti</code> DOUBLE PRECISION for <code>droti</code> Array, size at least $\max(indx(i))$.
c	REAL for <code>sroti</code> DOUBLE PRECISION for <code>droti</code> . A scalar.
s	REAL for <code>sroti</code> DOUBLE PRECISION for <code>droti</code> . A scalar.

Output Parameters

x and y	The updated arrays.
-------------	---------------------

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine `roti` interface are the following:

x	Holds the vector with the number of elements nz .
$indx$	Holds the vector with the number of elements nz .

y Holds the vector with the number of elements *nz*.

?sctr

Converts compressed sparse vectors into full storage form.

Syntax

```
call ssctr(nz, x, indx, y )
call dsctr(nz, x, indx, y )
call csctr(nz, x, indx, y )
call zsctr(nz, x, indx, y )
call sctr(x, indx, y)
```

Include Files

- mkl.fi, blas.f90

Description

The ?sctr routines scatter the elements of the compressed sparse vector (*nz*, *x*, *indx*) to a full-storage vector *y*. The routines modify only the elements of *y* whose indices are listed in the array *indx*:

$y(indx(i)) = x(i)$, for $i=1, 2, \dots, nz$.

Input Parameters

<i>nz</i>	INTEGER. The number of elements of <i>x</i> to be scattered.
<i>indx</i>	INTEGER. Specifies indices of elements to be scattered. Array, size at least <i>nz</i> .
<i>x</i>	REAL for ssctr DOUBLE PRECISION for dsctr COMPLEX for csctr DOUBLE COMPLEX for zsctr Array, size at least <i>nz</i> . Contains the vector to be converted to full-storage form.

Output Parameters

<i>y</i>	REAL for ssctr DOUBLE PRECISION for dsctr COMPLEX for csctr DOUBLE COMPLEX for zsctr Array, size at least $\max(indx(i))$. Contains the vector <i>y</i> with updated elements.
----------	--

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine `sctr` interface are the following:

<code>x</code>	Holds the vector with the number of elements <code>nz</code> .
<code>indx</code>	Holds the vector with the number of elements <code>nz</code> .
<code>y</code>	Holds the vector with the number of elements <code>nz</code> .

Sparse BLAS Level 2 and Level 3 Routines

This section describes Sparse BLAS Level 2 and Level 3 routines included in the Intel® Math Kernel Library (Intel® MKL). Sparse BLAS Level 2 is a group of routines and functions that perform operations between a sparse matrix and dense vectors. Sparse BLAS Level 3 is a group of routines and functions that perform operations between a sparse matrix and dense matrices.

The terms and concepts required to understand the use of the Intel MKL Sparse BLAS Level 2 and Level 3 routines are discussed in the [Linear Solvers Basics](#) appendix.

The Sparse BLAS routines can be useful to implement iterative methods for solving large sparse systems of equations or eigenvalue problems. For example, these routines can be considered as building blocks for [Iterative Sparse Solvers based on Reverse Communication Interface \(RCI ISS\)](#) described in the Chapter 8 of the manual.

Intel MKL provides Sparse BLAS Level 2 and Level 3 routines with typical (or conventional) interface similar to the interface used in the NIST* Sparse BLAS library [[Rem05](#)].

Some software packages and libraries (the [PARDISO* Solver](#) used in Intel MKL, *Sparskit 2* [[Saad94](#)], the Compaq* Extended Math Library (CXML)[[CXML01](#)]) use different (early) variation of the compressed sparse row (CSR) format and support only Level 2 operations with simplified interfaces. Intel MKL provides an additional set of Sparse BLAS Level 2 routines with similar simplified interfaces. Each of these routines operates only on a matrix of the fixed type.

The routines described in this section support both one-based indexing and zero-based indexing of the input data (see details in the section [One-based and Zero-based Indexing](#)).

Naming Conventions in Sparse BLAS Level 2 and Level 3

Each Sparse BLAS Level 2 and Level 3 routine has a six- or eight-character base name preceded by the prefix `mkl_` or `mkl_cspblas_`.

The routines with typical (conventional) interface have six-character base names in accordance with the template:

```
mkl_<character> <data> <operation>( )
```

The routines with simplified interfaces have eight-character base names in accordance with the templates:

```
mkl_<character> <data> <mtype> <operation>( )
```

for routines with one-based indexing; and

```
mkl_cspblas_<character> <data><mtype><operation>( )
```

for routines with zero-based indexing.

The `<character>` field indicates the data type:

<code>s</code>	real, single precision
----------------	------------------------

c	complex, single precision
d	real, double precision
z	complex, double precision

The `<data>` field indicates the sparse matrix storage format (see section [Sparse Matrix Storage Formats](#)):

coo	coordinate format
csr	compressed sparse row format and its variations
csc	compressed sparse column format and its variations
dia	diagonal format
sky	skyline storage format
bsr	block sparse row format and its variations

The `<operation>` field indicates the type of operation:

mv	matrix-vector product (Level 2)
mm	matrix-matrix product (Level 3)
sv	solving a single triangular system (Level 2)
sm	solving triangular systems with multiple right-hand sides (Level 3)

The field `<mtype>` indicates the matrix type:

ge	sparse representation of a general matrix
sy	sparse representation of the upper or lower triangle of a symmetric matrix
tr	sparse representation of a triangular matrix

Sparse Matrix Storage Formats

The current version of Intel MKL Sparse BLAS Level 2 and Level 3 routines support the following point entry [[Duff86](#)] storage formats for sparse matrices:

- *compressed sparse row* format (CSR) and its variations;
- *compressed sparse column* format (CSC);
- *coordinate* format;
- *diagonal* format;
- *skyline* storage format;

and one block entry storage format:

- *block sparse row* format (BSR) and its variations.

For more information see "[Sparse Matrix Storage Formats](#)" in Appendix A.

Intel MKL provides auxiliary routines - [matrix converters](#) - that convert sparse matrix from one storage format to another.

Routines and Supported Operations

This section describes operations supported by the Intel MKL Sparse BLAS Level 2 and Level 3 routines. The following notations are used here:

A is a sparse matrix;
 B and C are dense matrices;
 D is a diagonal scaling matrix;
 x and y are dense vectors;
 α and β are scalars;

$\text{op}(A)$ is one of the possible operations:

$\text{op}(A) = A$;
 $\text{op}(A) = A'$ - transpose of A ;
 $\text{op}(A) = \text{conj}(A')$ - conjugated transpose of A .

$\text{inv}(\text{op}(A))$ denotes the inverse of $\text{op}(A)$.

The Intel MKL Sparse BLAS Level 2 and Level 3 routines support the following operations:

- computing the vector product between a sparse matrix and a dense vector:

```
y := alpha*op(A)*x + beta*y
```

- solving a single triangular system:

```
y := alpha*inv(op(A))*x
```

- computing a product between sparse matrix and dense matrix:

```
C := alpha*op(A)*B + beta*C
```

- solving a sparse triangular system with multiple right-hand sides:

```
C := alpha*inv(op(A))*B
```

Intel MKL provides an additional set of the Sparse BLAS Level 2 routines with *simplified interfaces*. Each of these routines operates on a matrix of the fixed type. The following operations are supported:

- computing the vector product between a sparse matrix and a dense vector (for general and symmetric matrices):

```
y := op(A)*x
```

- solving a single triangular system (for triangular matrices):

```
y := inv(op(A))*x
```

Matrix type is indicated by the field `<mtype>` in the routine name (see section [Naming Conventions in Sparse BLAS Level 2 and Level 3](#)).

NOTE

The routines with simplified interfaces support only four sparse matrix storage formats, specifically:

CSR format in the 3-array variation accepted in the direct sparse solvers and in the CXML;
 diagonal format accepted in the CXML;
 coordinate format;
 BSR format in the 3-array variation.

Note that routines with both typical (conventional) and simplified interfaces use the same computational kernels that work with certain internal data structures.

The Intel MKL Sparse BLAS Level 2 and Level 3 routines do not support in-place operations.

Complete list of all routines is given in the [“Sparse BLAS Level 2 and Level 3 Routines”](#).

Interface Consideration

One-Based and Zero-Based Indexing

The Intel MKL Sparse BLAS Level 2 and Level 3 routines support one-based and zero-based indexing of data arrays.

Routines with typical interfaces support zero-based indexing for the following sparse data storage formats: CSR, CSC, BSR, and COO. Routines with simplified interfaces support zero based indexing for the following sparse data storage formats: CSR, BSR, and COO. See the complete list of [Sparse BLAS Level 2 and Level 3 Routines](#).

The one-based indexing uses the convention of starting array indices at 1. The zero-based indexing uses the convention of starting array indices at 0. For example, indices of the 5-element array x can be presented in case of one-based indexing as follows:

Element index: 1 2 3 4 5

Element value: 1.0 5.0 7.0 8.0 9.0

and in case of zero-based indexing as follows:

Element index: 0 1 2 3 4

Element value: 1.0 5.0 7.0 8.0 9.0

The detailed descriptions of the one-based and zero-based variants of the sparse data storage formats are given in the "[Sparse Matrix Storage Formats](#)" in Appendix A.

Most parameters of the routines are identical for both one-based and zero-based indexing, but some of them have certain differences. The following table lists all these differences.

Parameter	One-based Indexing	Zero-based Indexing
<i>val</i>	Array containing non-zero elements of the matrix A , its length is $pntrb(m) - pntrb(1)$.	Array containing non-zero elements of the matrix A , its length is $pntrb(m-1) - pntrb(0)$.
<i>pntrb</i>	Array of length m . This array contains row indices, such that $pntrb(i) - pntrb(1)+1$ is the first index of row i in the arrays <i>val</i> and <i>indx</i>	Array of length m . This array contains row indices, such that $pntrb(i) - pntrb(0)$ is the first index of row i in the arrays <i>val</i> and <i>indx</i> .
<i>pntrb</i>	Array of length m . This array contains row indices, such that $pntrb(i) - pntrb(1)$ is the last index of row i in the arrays <i>val</i> and <i>indx</i> .	Array of length m . This array contains row indices, such that $pntrb(i) - pntrb(0)-1$ is the last index of row i in the arrays <i>val</i> and <i>indx</i> .
<i>ia</i>	Array of length $m + 1$, containing indices of elements in the array a , such that $ia(i)$ is the index in the array a of the first non-zero element from the row i . The value of the last element $ia(m + 1)$ is equal to the number of non-zeros plus one.	Array of length $m+1$, containing indices of elements in the array a , such that $ia(i)$ is the index in the array a of the first non-zero element from the row i . The value of the last element $ia(m)$ is equal to the number of non-zeros.
<i>ldb</i>	Specifies the leading dimension of b as declared in the calling (sub)program.	Specifies the second dimension of b as declared in the calling (sub)program.

Parameter	One-based Indexing	Zero-based Indexing
<i>ldc</i>	Specifies the leading dimension of <i>c</i> as declared in the calling (sub)program.	Specifies the second dimension of <i>c</i> as declared in the calling (sub)program.

Differences Between Intel MKL and NIST* Interfaces

The Intel MKL Sparse BLAS Level 3 routines have the following conventional interfaces:

`mkl_xyyyymm(transa, m, n, k, alpha, matdescra, arg(A), b, ldb, beta, c, ldc)`, for matrix-matrix product;

`mkl_xyyysm(transa, m, n, alpha, matdescra, arg(A), b, ldb, c, ldc)`, for triangular solvers with multiple right-hand sides.

Here *x* denotes data type, and *yyy* - sparse matrix data structure (storage format).

The analogous NIST* Sparse BLAS (NSB) library routines have the following interfaces:

`xyyyymm(transa, m, n, k, alpha, descra, arg(A), b, ldb, beta, c, ldc, work, lwork)`, for matrix-matrix product;

`xyyyysm(transa, m, n, unitd, dv, alpha, descra, arg(A), b, ldb, beta, c, ldc, work, lwork)`, for triangular solvers with multiple right-hand sides.

Some similar arguments are used in both libraries. The argument *transa* indicates what operation is performed and is slightly different in the NSB library (see Table "Parameter *transa*"). The arguments *m* and *k* are the number of rows and column in the matrix *A*, respectively, *n* is the number of columns in the matrix *C*. The arguments *alpha* and *beta* are scalar *alpha* and *beta* respectively (*beta* is not used in the Intel MKL triangular solvers.) The arguments *b* and *c* are rectangular arrays with the leading dimension *ldb* and *ldc*, respectively. `arg(A)` denotes the list of arguments that describe the sparse representation of *A*.

Parameter *transa*

	MKL interface	NSB interface	Operation
data type	CHARACTER*1	INTEGER	
value	N or n	0	$\text{op}(A) = A$
	T or t	1	$\text{op}(A) = A'$
	C or c	2	$\text{op}(A) = A'$

Parameter *matdescra*

The parameter *matdescra* describes the relevant characteristic of the matrix *A*. This manual describes *matdescra* as an array of six elements in line with the NIST* implementation. However, only the first four elements of the array are used in the current versions of the Intel MKL Sparse BLAS routines. Elements *matdescra*(5) and *matdescra*(6) are reserved for future use. Note that whether *matdescra* is described in your application as an array of length 6 or 4 is of no importance because the array is declared as a pointer in the Intel MKL routines. To learn more about declaration of the *matdescra* array, see the Sparse BLAS examples located in the Intel MKL installation directory: `examples/spblasf/` for Fortran. The table below lists elements of the parameter *matdescra*, their Fortran values, and their meanings. The parameter *matdescra* corresponds to the argument *descra* from NSB library.

Possible Values of the Parameter *matdescra* (*descra*)

	MKL interface		NSB interface	Matrix characteristics
	one-based indexing	zero-based indexing		
data type	CHARACTER	Char	INTEGER	
1st element	<i>matdescra</i> (1)	<i>matdescra</i> (0)	<i>descra</i> (1)	matrix structure
value	G	G	0	general
	S	S	1	symmetric ($A = A'$)
	H	H	2	Hermitian ($A = \text{conjg}(A')$)
	T	T	3	triangular
	A	A	4	skew(anti)-symmetric ($A = -A'$)
	D	D	5	diagonal
2nd element	<i>matdescra</i> (2)	<i>matdescra</i> (1)	<i>descra</i> (2)	upper/lower triangular indicator
value	L	L	1	lower
	U	U	2	upper
3rd element	<i>matdescra</i> (3)	<i>matdescra</i> (2)	<i>descra</i> (3)	main diagonal type
value	N	N	0	non-unit
	U	U	1	unit
4th element	<i>matdescra</i> (4)	<i>matdescra</i> (3)	<i>descra</i> (4)	type of indexing
value	F		1	one-based indexing
		C	0	zero-based indexing

In some cases possible element values of the parameter *matdescra* depend on the values of other elements. The [Table "Possible Combinations of Element Values of the Parameter *matdescra*"](#) lists all possible combinations of element values for both multiplication routines and triangular solvers.

Possible Combinations of Element Values of the Parameter *matdescra*

Routines	<i>matdescra</i> (1)	<i>matdescra</i> (2)	<i>matdescra</i> (3)	<i>matdescra</i> (4)
Multiplication Routines	G	ignored	ignored	F (default) or C
	S or H	L (default)	N (default)	F (default) or C
	S or H	L (default)	U	F (default) or C
	S or H	U	N (default)	F (default) or C
	S or H	U	U	F (default) or C
	A	L (default)	ignored	F (default) or C
	A	U	ignored	F (default) or C
Multiplication Routines and Triangular Solvers	T	L	U	F (default) or C

Routines	matdescra(1)	matdescra(2)	matdescra(3)	matdescra(4)
	T	L	N	F (default) or C
	T	U	U	F (default) or C
	T	U	N	F (default) or C
	D	ignored	N (default)	F (default) or C
	D	ignored	U	F (default) or C

For a matrix in the skyline format with the main diagonal declared to be a unit, diagonal elements must be stored in the sparse representation even if they are zero. In all other formats, diagonal elements can be stored (if needed) in the sparse representation if they are not zero.

Operations with Partial Matrices

One of the distinctive feature of the Intel MKL Sparse BLAS routines is a possibility to perform operations only on partial matrices composed of certain parts (triangles and the main diagonal) of the input sparse matrix. It can be done by setting properly first three elements of the parameter *matdescra*.

An arbitrary sparse matrix A can be decomposed as

$$A = L + D + U$$

where L is the strict lower triangle of A , U is the strict upper triangle of A , D is the main diagonal.

Table "Output Matrices for Multiplication Routines" shows correspondence between the output matrices and values of the parameter *matdescra* for the sparse matrix A for multiplication routines.

Output Matrices for Multiplication Routines

matdescra(1)	matdescra(2)	matdescra(3)	Output Matrix
G	ignored	ignored	$\alpha * \text{op}(A) * x + \beta * y$ $\alpha * \text{op}(A) * B + \beta * C$
S or H	L	N	$\alpha * \text{op}(L+D+L') * x + \beta * y$ $\alpha * \text{op}(L+D+L') * B + \beta * C$
S or H	L	U	$\alpha * \text{op}(L+I+L') * x + \beta * y$ $\alpha * \text{op}(L+I+L') * B + \beta * C$
S or H	U	N	$\alpha * \text{op}(U'+D+U) * x + \beta * y$ $\alpha * \text{op}(U'+D+U) * B + \beta * C$
S or H	U	U	$\alpha * \text{op}(U'+I+U) * x + \beta * y$ $\alpha * \text{op}(U'+I+U) * B + \beta * C$
T	L	U	$\alpha * \text{op}(L+I) * x + \beta * y$ $\alpha * \text{op}(L+I) * B + \beta * C$
T	L	N	$\alpha * \text{op}(L+D) * x + \beta * y$ $\alpha * \text{op}(L+D) * B + \beta * C$
T	U	U	$\alpha * \text{op}(U+I) * x + \beta * y$ $\alpha * \text{op}(U+I) * B + \beta * C$
T	U	N	$\alpha * \text{op}(U+D) * x + \beta * y$ $\alpha * \text{op}(U+D) * B + \beta * C$
A	L	ignored	$\alpha * \text{op}(L-L') * x + \beta * y$

matdescra(1)	matdescra(2)	matdescra(3)	Output Matrix
			$\alpha * \text{op}(L-L') * B + \beta * C$
A	U	ignored	$\alpha * \text{op}(U-U') * x + \beta * y$ $\alpha * \text{op}(U-U') * B + \beta * C$
D	ignored	N	$\alpha * D * x + \beta * y$ $\alpha * D * B + \beta * C$
D	ignored	U	$\alpha * x + \beta * y$ $\alpha * B + \beta * C$

Table “Output Matrices for Triangular Solvers” shows correspondence between the output matrices and values of the parameter *matdescra* for the sparse matrix A for triangular solvers.

Output Matrices for Triangular Solvers

matdescra(1)	matdescra(2)	matdescra(3)	Output Matrix
T	L	N	$\alpha * \text{inv}(\text{op}(L+L)) * x$ $\alpha * \text{inv}(\text{op}(L+L)) * B$
T	L	U	$\alpha * \text{inv}(\text{op}(L+L)) * x$ $\alpha * \text{inv}(\text{op}(L+L)) * B$
T	U	N	$\alpha * \text{inv}(\text{op}(U+U)) * x$ $\alpha * \text{inv}(\text{op}(U+U)) * B$
T	U	U	$\alpha * \text{inv}(\text{op}(U+U)) * x$ $\alpha * \text{inv}(\text{op}(U+U)) * B$
D	ignored	N	$\alpha * \text{inv}(D) * x$ $\alpha * \text{inv}(D) * B$
D	ignored	U	$\alpha * x$ $\alpha * B$

Sparse BLAS Level 2 and Level 3 Routines.

Table “Sparse BLAS Level 2 and Level 3 Routines” lists the sparse BLAS Level 2 and Level 3 routines described in more detail later in this section.

Sparse BLAS Level 2 and Level 3 Routines

Routine/Function	Description
Simplified interface, one-based indexing	
<code>mkl_?csrgevmv</code>	Computes matrix - vector product of a sparse general matrix in the CSR format (3-array variation)
<code>mkl_?bsrgevmv</code>	Computes matrix - vector product of a sparse general matrix in the BSR format (3-array variation).
<code>mkl_?coogemv</code>	Computes matrix - vector product of a sparse general matrix in the coordinate format.

Routine/Function	Description
<code>mkl_?diagmv</code>	Computes matrix - vector product of a sparse general matrix in the diagonal format.
<code>mkl_?csrsv</code>	Computes matrix - vector product of a sparse symmetrical matrix in the CSR format (3-array variation)
<code>mkl_?bsrsv</code>	Computes matrix - vector product of a sparse symmetrical matrix in the BSR format (3-array variation).
<code>mkl_?coosv</code>	Computes matrix - vector product of a sparse symmetrical matrix in the coordinate format.
<code>mkl_?diasv</code>	Computes matrix - vector product of a sparse symmetrical matrix in the diagonal format.
<code>mkl_?csrtrsv</code>	Triangular solvers with simplified interface for a sparse matrix in the CSR format (3-array variation).
<code>mkl_?bsrtrsv</code>	Triangular solver with simplified interface for a sparse matrix in the BSR format (3-array variation).
<code>mkl_?cootrsv</code>	Triangular solvers with simplified interface for a sparse matrix in the coordinate format.
<code>mkl_?diatrsv</code>	Triangular solvers with simplified interface for a sparse matrix in the diagonal format.

Simplified interface, zero-based indexing

<code>mkl_cspblas_?csrgemv</code>	Computes matrix - vector product of a sparse general matrix in the CSR format (3-array variation) with zero-based indexing.
<code>mkl_cspblas_?bsrgemv</code>	Computes matrix - vector product of a sparse general matrix in the BSR format (3-array variation) with zero-based indexing.
<code>mkl_cspblas_?coogemv</code>	Computes matrix - vector product of a sparse general matrix in the coordinate format with zero-based indexing.
<code>mkl_cspblas_?csrsv</code>	Computes matrix - vector product of a sparse symmetrical matrix in the CSR format (3-array variation) with zero-based indexing
<code>mkl_cspblas_?bsrsv</code>	Computes matrix - vector product of a sparse symmetrical matrix in the BSR format (3-array variation) with zero-based indexing.
<code>mkl_cspblas_?coosv</code>	Computes matrix - vector product of a sparse symmetrical matrix in the coordinate format with zero-based indexing.
<code>mkl_cspblas_?csrtrsv</code>	Triangular solvers with simplified interface for a sparse matrix in the CSR format (3-array variation) with zero-based indexing.
<code>mkl_cspblas_?bsrtrsv</code>	Triangular solver with simplified interface for a sparse matrix in the BSR format (3-array variation) with zero-based indexing.
<code>mkl_cspblas_?cootrsv</code>	Triangular solver with simplified interface for a sparse matrix in the coordinate format with zero-based indexing.

Routine/Function	Description
Typical (conventional) interface, one-based and zero-based indexing	
<code>mkl_?csrmmv</code>	Computes matrix - vector product of a sparse matrix in the CSR format.
<code>mkl_?bsrmmv</code>	Computes matrix - vector product of a sparse matrix in the BSR format.
<code>mkl_?cscmmv</code>	Computes matrix - vector product for a sparse matrix in the CSC format.
<code>mkl_?coommmv</code>	Computes matrix - vector product for a sparse matrix in the coordinate format.
<code>mkl_?csrsv</code>	Solves a system of linear equations for a sparse matrix in the CSR format.
<code>mkl_?bsrsv</code>	Solves a system of linear equations for a sparse matrix in the BSR format.
<code>mkl_?cscsv</code>	Solves a system of linear equations for a sparse matrix in the CSC format.
<code>mkl_?coosv</code>	Solves a system of linear equations for a sparse matrix in the coordinate format.
<code>mkl_?csrmm</code>	Computes matrix - matrix product of a sparse matrix in the CSR format
<code>mkl_?bsrmm</code>	Computes matrix - matrix product of a sparse matrix in the BSR format.
<code>mkl_?cscmm</code>	Computes matrix - matrix product of a sparse matrix in the CSC format
<code>mkl_?coomm</code>	Computes matrix - matrix product of a sparse matrix in the coordinate format.
<code>mkl_?csrsm</code>	Solves a system of linear matrix equations for a sparse matrix in the CSR format.
<code>mkl_?bsrsm</code>	Solves a system of linear matrix equations for a sparse matrix in the BSR format.
<code>mkl_?cscsm</code>	Solves a system of linear matrix equations for a sparse matrix in the CSC format.
<code>mkl_?coosm</code>	Solves a system of linear matrix equations for a sparse matrix in the coordinate format.

Typical (conventional) interface, one-based indexing

<code>mkl_?diamv</code>	Computes matrix - vector product of a sparse matrix in the diagonal format.
<code>mkl_?skymv</code>	Computes matrix - vector product for a sparse matrix in the skyline storage format.
<code>mkl_?diasv</code>	Solves a system of linear equations for a sparse matrix in the diagonal format.

Routine/Function	Description
<code>mkl_?skysv</code>	Solves a system of linear equations for a sparse matrix in the skyline format.
<code>mkl_?diamm</code>	Computes matrix - matrix product of a sparse matrix in the diagonal format.
<code>mkl_?skymm</code>	Computes matrix - matrix product of a sparse matrix in the skyline storage format.
<code>mkl_?diasm</code>	Solves a system of linear matrix equations for a sparse matrix in the diagonal format.
<code>mkl_?skysm</code>	Solves a system of linear matrix equations for a sparse matrix in the skyline storage format.
Auxiliary routines	
Matrix converters	
<code>mkl_?dnscsr</code>	Converts a sparse matrix in uncompressed representation to CSR format (3-array variation) and vice versa.
<code>mkl_?csrcoo</code>	Converts a sparse matrix in CSR format (3-array variation) to coordinate format and vice versa.
<code>mkl_?csrbsr</code>	Converts a sparse matrix in CSR format to BSR format (3-array variations) and vice versa.
<code>mkl_?csrpsc</code>	Converts a sparse matrix in CSR format to CSC format and vice versa (3-array variations).
<code>mkl_?csrdia</code>	Converts a sparse matrix in CSR format (3-array variation) to diagonal format and vice versa.
<code>mkl_?csrsky</code>	Converts a sparse matrix in CSR format (3-array variation) to sky line format and vice versa.
Operations on sparse matrices	
<code>mkl_?csradd</code>	Computes the sum of two sparse matrices stored in the CSR format (3-array variation) with one-based indexing.
<code>mkl_?csrmultcsr</code>	Computes the product of two sparse matrices stored in the CSR format (3-array variation) with one-based indexing.
<code>mkl_?csrmultd</code>	Computes product of two sparse matrices stored in the CSR format (3-array variation) with one-based indexing. The result is stored in the dense matrix.

`mkl_?csrgemv`

Computes matrix - vector product of a sparse general matrix stored in the CSR format (3-array variation) with one-based indexing.

Syntax

```
call mkl_scsrgemv(transa, m, a, ia, ja, x, y)
call mkl_dcsrgemv(transa, m, a, ia, ja, x, y)
call mkl_ccsrgemv(transa, m, a, ia, ja, x, y)
call mkl_zcsrgemv(transa, m, a, ia, ja, x, y)
```

Include Files

- `mkl.fi`

Description

The `mkl_?csrsgemv` routine performs a matrix-vector operation defined as

```
y := A*x
```

or

```
y := A'*x,
```

where:

x and y are vectors,

A is an m -by- m sparse square matrix in the CSR format (3-array variation), A' is the transpose of A .

NOTE

This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section "**Interfaces**" below.

<i>transa</i>	<p>CHARACTER*1. Specifies the operation.</p> <p>If <i>transa</i> = 'N' or 'n', then as $y := A*x$</p> <p>If <i>transa</i> = 'T' or 't' or 'C' or 'c', then $y := A'*x$,</p>
<i>m</i>	<p>INTEGER. Number of rows of the matrix A.</p>
<i>a</i>	<p>REAL for <code>mkl_scsrsgemv</code>.</p> <p>DOUBLE PRECISION for <code>mkl_dcsrsgemv</code>.</p> <p>COMPLEX for <code>mkl_ccsrsgemv</code>.</p> <p>DOUBLE COMPLEX for <code>mkl_zcsrsgemv</code>.</p> <p>Array containing non-zero elements of the matrix A. Its length is equal to the number of non-zero elements in the matrix A. Refer to <i>values</i> array description in Sparse Matrix Storage Formats for more details.</p>
<i>ia</i>	<p>INTEGER. Array of length $m + 1$, containing indices of elements in the array a, such that $ia(i)$ is the index in the array a of the first non-zero element from the row i. The value of the last element $ia(m + 1)$ is equal to the number of non-zeros plus one. Refer to <i>rowIndex</i> array description in Sparse Matrix Storage Formats for more details.</p>
<i>ja</i>	<p>INTEGER. Array containing the column indices for each non-zero element of the matrix A.</p> <p>Its length is equal to the length of the array a. Refer to <i>columns</i> array description in Sparse Matrix Storage Formats for more details.</p>
<i>x</i>	<p>REAL for <code>mkl_scsrsgemv</code>.</p>

DOUBLE PRECISION for mkl_dcsrgemv.

COMPLEX for mkl_ccsrgemv.

DOUBLE COMPLEX for mkl_zcsrgemv.

Array, size is m .

On entry, the array x must contain the vector x .

Output Parameters

y

REAL for mkl_scsrgemv.

DOUBLE PRECISION for mkl_dcsrgemv.

COMPLEX for mkl_ccsrgemv.

DOUBLE COMPLEX for mkl_zcsrgemv.

Array, size at least m .

On exit, the array y must contain the vector y .

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_scsrgemv(transa, m, a, ia, ja, x, y)
```

```
  CHARACTER*1  transa
```

```
  INTEGER      m
```

```
  INTEGER      ia(*), ja(*)
```

```
  REAL         a(*), x(*), y(*)
```

```
SUBROUTINE mkl_dcsrgemv(transa, m, a, ia, ja, x, y)
```

```
  CHARACTER*1  transa
```

```

```

```
  INTEGER      ia(*), ja(*)
```

```
  DOUBLE COMPLEX  a(*), x(*), y(*)
```

mkl_?bsrgemv

Computes matrix - vector product of a sparse general matrix stored in the BSR format (3-array variation) with one-based indexing.

Syntax

```
call mkl_sbsrgemv(transa, m, lb, a, ia, ja, x, y)
call mkl_dbsrgemv(transa, m, lb, a, ia, ja, x, y)
call mkl_cbsrgemv(transa, m, lb, a, ia, ja, x, y)
call mkl_zbsrgemv(transa, m, lb, a, ia, ja, x, y)
```

Include Files

- mkl.fi

Description

The `mkl_?bsrgemv` routine performs a matrix-vector operation defined as

```
y := A*x
```

or

```
y := A'*x,
```

where:

x and y are vectors,

A is an m -by- m block sparse square matrix in the BSR format (3-array variation), A' is the transpose of A .

NOTE

This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section "**Interfaces**" below.

<i>transa</i>	CHARACTER*1. Specifies the operation. If <i>transa</i> = 'N' or 'n', then the matrix-vector product is computed as $y := A*x$ If <i>transa</i> = 'T' or 't' or 'C' or 'c', then the matrix-vector product is computed as $y := A'*x$,
<i>m</i>	INTEGER. Number of block rows of the matrix A .
<i>lb</i>	INTEGER. Size of the block in the matrix A .
<i>a</i>	REAL for <code>mkl_sbsrgemv</code> . DOUBLE PRECISION for <code>mkl_dbsrgemv</code> . COMPLEX for <code>mkl_cbsrgemv</code> . DOUBLE COMPLEX for <code>mkl_zbsrgemv</code> .

Array containing elements of non-zero blocks of the matrix A . Its length is equal to the number of non-zero blocks in the matrix A multiplied by $lb*lb$. Refer to *values* array description in [BSR Format](#) for more details.

ia INTEGER. Array of length $(m + 1)$, containing indices of block in the array a , such that $ia(i)$ is the index in the array a of the first non-zero element from the row i . The value of the last element $ia(m + 1)$ is equal to the number of non-zero blocks plus one. Refer to *rowIndex* array description in [BSR Format](#) for more details.

ja INTEGER. Array containing the column indices for each non-zero block in the matrix A .
Its length is equal to the number of non-zero blocks of the matrix A . Refer to *columns* array description in [BSR Format](#) for more details.

x REAL for `mk1_sbsrgemv`.
DOUBLE PRECISION for `mk1_dbsrgemv`.
COMPLEX for `mk1_cbsrgemv`.
DOUBLE COMPLEX for `mk1_zbsrgemv`.
Array, size $(m*lb)$.
On entry, the array x must contain the vector x .

Output Parameters

y REAL for `mk1_sbsrgemv`.
DOUBLE PRECISION for `mk1_dbsrgemv`.
COMPLEX for `mk1_cbsrgemv`.
DOUBLE COMPLEX for `mk1_zbsrgemv`.
Array, size at least $(m*lb)$.
On exit, the array y must contain the vector y .

Interfaces

FORTRAN 77:

```

```
INTEGER ia(*), ja(*)
```

```
DOUBLE COMPLEX a(*), x(*), y(*)
```

mkl_?coogemv

Computes matrix-vector product of a sparse general matrix stored in the coordinate format with one-based indexing.

Syntax

```
call mkl_scoogemv(transa, m, val, rowind, colind, nnz, x, y)
```

```
call mkl_dcoogemv(transa, m, val, rowind, colind, nnz, x, y)
```

```
call mkl_ccoogemv(transa, m, val, rowind, colind, nnz, x, y)
```

```
call mkl_zcoogemv(transa, m, val, rowind, colind, nnz, x, y)
```

Include Files

- mkl.fi

Description

The mkl_?coogemv routine performs a matrix-vector operation defined as

```
y := A*x
```

or

```
y := A'*x,
```

where:

x and y are vectors,

A is an m -by- m sparse square matrix in the coordinate format, A' is the transpose of A.

NOTE

This routine supports only one-based indexing of the input arrays.

Input Parameters

mkl_?diagemv

Computes matrix - vector product of a sparse general matrix stored in the diagonal format with one-based indexing.

Syntax

```
call mkl_sdiagemv(transa, m, val, lval, idiag, ndiag, x, y)
```

```
call mkl_ddiagemv(transa, m, val, lval, idiag, ndiag, x, y)
```

```
call mkl_cdiagemv(transa, m, val, lval, idiag, ndiag, x, y)
```

```
call mkl_zdiagemv(transa, m, val, lval, idiag, ndiag, x, y)
```

Include Files

- mkl.fi

Description

The `mkl_?diagemv` routine performs a matrix-vector operation defined as

`y := A*x`

or

`y := A'*x,`

where:

x and y are vectors,

A is an m -by- m sparse square matrix in the diagonal storage format, A' is the transpose of A .

NOTE

This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section "**Interfaces**" below.

<i>transa</i>	<p>CHARACTER*1. Specifies the operation.</p> <p>If <i>transa</i> = 'N' or 'n', then $y := A*x$</p> <p>If <i>transa</i> = 'T' or 't' or 'C' or 'c', then $y := A'*x$,</p>

```

mkl_?csrsymv

Computes matrix - vector product of a sparse symmetrical matrix stored in the CSR format (3-array variation) with one-based indexing.

Syntax

```
call mkl_scsrsvmv(uplo, m, a, ia, ja, x, y)
call mkl_dcsrsvmv(uplo, m, a, ia, ja, x, y)
call mkl_ccsrsvmv(uplo, m, a, ia, ja, x, y)
call mkl_zcsrsvmv(uplo, m, a, ia, ja, x, y)
```

Include Files

- mkl.fi

Description

The `mkl_?csrsvmv` routine performs a matrix-vector operation defined as

```
y := A*x
```

where:

x and y are vectors,

A is an upper or lower triangle of the symmetrical sparse matrix in the CSR format (3-array variation).

NOTE

This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section "**Interfaces**" below.

<i>uplo</i>	<p>CHARACTER*1. Specifies whether the upper or low triangle of the matrix A is used.</p> <p>If <i>uplo</i> = 'U' or 'u', then the upper triangle of the matrix A is used.</p> <p>If <i>uplo</i> = 'L' or 'l', then the low triangle of the matrix A is used.</p>
<i>m</i>	<p>INTEGER. Number of rows of the matrix A.</p>
<i>a</i>	<p>REAL for <code>mkl_scsrsvmv</code>.</p> <p>DOUBLE PRECISION for <code>mkl_dcsrsvmv</code>.</p> <p>COMPLEX for <code>mkl_ccsrsvmv</code>.</p> <p>DOUBLE COMPLEX for <code>mkl_zcsrsvmv</code>.</p> <p>Array containing non-zero elements of the matrix A. Its length is equal to the number of non-zero elements in the matrix A. Refer to <i>values</i> array description in Sparse Matrix Storage Formats for more details.</p>
<i>ia</i>	<p>INTEGER. Array of length $m + 1$, containing indices of elements in the array a, such that $ia(i)$ is the index in the array a of the first non-zero element from the row i. The value of the last element $ia(m + 1)$ is equal to the number of non-zeros plus one. Refer to <i>rowIndex</i> array description in Sparse Matrix Storage Formats for more details.</p>

<i>ja</i>	<p>INTEGER. Array containing the column indices for each non-zero element of the matrix <i>A</i>.</p> <p>Its length is equal to the length of the array <i>a</i>. Refer to <i>columns</i> array description in Sparse Matrix Storage Formats for more details.</p>
<i>x</i>	<p>REAL for <code>mkl_scsrsymv</code>.</p> <p>DOUBLE PRECISION for <code>mkl_dcsrsymv</code>.</p> <p>COMPLEX for <code>mkl_ccsrsymv</code>.</p> <p>DOUBLE COMPLEX for <code>mkl_zcsrsymv</code>.</p> <p>Array, size is <i>m</i>.</p> <p>On entry, the array <i>x</i> must contain the vector <i>x</i>.</p>

Output Parameters

<i>y</i>	<p>REAL for <code>mkl_scsrsymv</code>.</p> <p>DOUBLE PRECISION for <code>mkl_dcsrsymv</code>.</p> <p>COMPLEX for <code>mkl_ccsrsymv</code>.</p> <p>DOUBLE COMPLEX for <code>mkl_zcsrsymv</code>.</p> <p>Array, size at least <i>m</i>.</p> <p>On exit, the array <i>y</i> must contain the vector <i>y</i>.</p>

mkl_?bsrsymv

Computes matrix-vector product of a sparse symmetrical matrix stored in the BSR format (3-array variation) with one-based indexing.

Syntax

```
call mkl_sbsrsymv(uplo, m, lb, a, ia, ja, x, y)
```

```
call mkl_dbsrsymv(uplo, m, lb, a, ia, ja, x, y)
```

```
call mkl_cbsrsymv(uplo, m, lb, a, ia, ja, x, y)
```

```
call mkl_zbsrsymv(uplo, m, lb, a, ia, ja, x, y)
```

Include Files

- mkl.fi

Description

The `mkl_?bsrsymv` routine performs a matrix-vector operation defined as

```
y := A*x
```

where:

x and y are vectors,

A is an upper or lower triangle of the symmetrical sparse matrix in the BSR format (3-array variation).

NOTE

This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section "**Interfaces**" below.

uplo

CHARACTER*1. Specifies whether the upper or low triangle of the matrix A is considered.

If *uplo* = 'U' or 'u', then the upper triangle of the matrix A is used.

If *uplo* = 'L' or 'l', then the low triangle of the matrix A is used.

m

INTEGER. Number of block rows of the matrix A .

<i>lb</i>	INTEGER. Size of the block in the matrix <i>A</i> .
<i>a</i>	<p>REAL for <code>mkl_sbsrsymv</code>.</p> <p>DOUBLE PRECISION for <code>mkl_dbsrsymv</code>.</p> <p>COMPLEX for <code>mkl_cbsrsymv</code>.</p> <p>DOUBLE COMPLEX for <code>mkl_zcsrgemv</code>.</p> <p>Array containing elements of non-zero blocks of the matrix <i>A</i>. Its length is equal to the number of non-zero blocks in the matrix <i>A</i> multiplied by <i>lb*lb</i>. Refer to <i>values</i> array description in BSR Format for more details.</p>
<i>ia</i>	<p>INTEGER. Array of length $(m + 1)$, containing indices of block in the array <i>a</i>, such that <i>ia</i>(<i>i</i>) is the index in the array <i>a</i> of the first non-zero element from the row <i>i</i>. The value of the last element <i>ia</i>(<i>m</i> + 1) is equal to the number of non-zero blocks plus one. Refer to <i>rowIndex</i> array description in BSR Format for more details.</p>
<i>ja</i>	<p>INTEGER. Array containing the column indices for each non-zero block in the matrix <i>A</i>.</p> <p>Its length is equal to the number of non-zero blocks of the matrix <i>A</i>. Refer to <i>columns</i> array description in BSR Format for more details.</p>
<i>x</i>	<p>REAL for <code>mkl_sbsrsymv</code>.</p> <p>DOUBLE PRECISION for <code>mkl_dbsrsymv</code>.</p> <p>COMPLEX for <code>mkl_cbsrsymv</code>.</p> <p>DOUBLE COMPLEX for <code>mkl_zcsrgemv</code>.</p> <p>Array, size $(m*lb)$.</p> <p>On entry, the array <i>x</i> must contain the vector <i>x</i>.</p>

Output Parameters

<i>y</i>	<p>REAL for <code>mkl_sbsrsymv</code>.</p> <p>DOUBLE PRECISION for <code>mkl_dbsrsymv</code>.</p> <p>COMPLEX for <code>mkl_cbsrsymv</code>.</p> <p>DOUBLE COMPLEX for <code>mkl_zcsrgemv</code>.</p> <p>Array, size at least $(m*lb)$.</p> <p>On exit, the array <i>y</i> must contain the vector <i>y</i>.</p>

mkl_?csrtrsv

Triangular solvers with simplified interface for a sparse matrix in the CSR format (3-array variation) with one-based indexing.

Syntax

```
call mkl_scsrtrsv(uplo, transa, diag, m, a, ia, ja, x, y)
call mkl_dcsrtrsv(uplo, transa, diag, m, a, ia, ja, x, y)
call mkl_ccsrtrsv(uplo, transa, diag, m, a, ia, ja, x, y)
call mkl_zcsrtrsv(uplo, transa, diag, m, a, ia, ja, x, y)
```

Include Files

- mkl.fi

Description

The `mkl_?csrtrsv` routine solves a system of linear equations with matrix-vector operations for a sparse matrix stored in the CSR format (3 array variation):

$$A*y = x$$

or

$$A'*y = x,$$

where:

x and y are vectors,

A is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, A' is the transpose of A .

NOTE

This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section "**Interfaces**" below.

<i>uplo</i>	<p>CHARACTER*1. Specifies whether the upper or low triangle of the matrix A is used.</p> <p>If <i>uplo</i> = 'U' or 'u', then the upper triangle of the matrix A is used.</p> <p>If <i>uplo</i> = 'L' or 'l', then the low triangle of the matrix A is used.</p>
<i>transa</i>	<p>CHARACTER*1. Specifies the system of linear equations.</p> <p>If <i>transa</i> = 'N' or 'n', then $A*y = x$</p> <p>If <i>transa</i> = 'T' or 't' or 'C' or 'c', then $A'*y = x$,</p>
<i>diag</i>	<p>CHARACTER*1. Specifies whether A is unit triangular.</p> <p>If <i>diag</i> = 'U' or 'u', then A is a unit triangular.</p> <p>If <i>diag</i> = 'N' or 'n', then A is not unit triangular.</p>
<i>m</i>	INTEGER. Number of rows of the matrix A .
<i>a</i>	<p>REAL for <code>mkl_scsrtrmv</code>.</p> <p>DOUBLE PRECISION for <code>mkl_dcsrtrmv</code>.</p>

COMPLEX for `mkl_ccsrtrmv`.

DOUBLE COMPLEX for `mkl_zcsrtrmv`.

Array containing non-zero elements of the matrix A . Its length is equal to the number of non-zero elements in the matrix A . Refer to *values* array description in [Sparse Matrix Storage Formats](#) for more details.

NOTE

The non-zero elements of the given row of the matrix must be stored in the same order as they appear in the row (from left to right).

No diagonal element can be omitted from a sparse storage if the solver is called with the non-unit indicator.

ia INTEGER. Array of length $m + 1$, containing indices of elements in the array *a*, such that *ia*(*i*) is the index in the array *a* of the first non-zero element from the row *i*. The value of the last element *ia*($m + 1$) is equal to the number of non-zeros plus one. Refer to *rowIndex* array description in [Sparse Matrix Storage Formats](#) for more details.

ja INTEGER. Array containing the column indices for each non-zero element of the matrix A .

Its length is equal to the length of the array *a*. Refer to *columns* array description in [Sparse Matrix Storage Formats](#) for more details.

NOTE

Column indices must be sorted in increasing order for each row.

x REAL for `mkl_scsrtrmv`.
 DOUBLE PRECISION for `mkl_dcsrtrmv`.
 COMPLEX for `mkl_ccsrtrmv`.
 DOUBLE COMPLEX for `mkl_zcsrtrmv`.

Array, size is m .

On entry, the array *x* must contain the vector x .

Output Parameters

y REAL for `mkl_scsrtrmv`.
 DOUBLE PRECISION for `mkl_dcsrtrmv`.
 COMPLEX for `mkl_ccsrtrmv`.
 DOUBLE COMPLEX for `mkl_zcsrtrmv`.

Array, size at least m .

Contains the vector y .

Interfaces

mkl_?bsrtrsv

Triangular solver with simplified interface for a sparse matrix stored in the BSR format (3-array variation) with one-based indexing.

Syntax

```
call mkl_sbsrtrsv(uplo, transa, diag, m, lb, a, ia, ja, x, y)
```

```
call mkl_dbsrtrsv(uplo, transa, diag, m, lb, a, ia, ja, x, y)
```

```
call mkl_cbsrtrsv(uplo, transa, diag, m, lb, a, ia, ja, x, y)
```

```
call mkl_zbsrtrsv(uplo, transa, diag, m, lb, a, ia, ja, x, y)
```

Include Files

- mkl.fi

Description

The `mkl_?bsrtrsv` routine solves a system of linear equations with matrix-vector operations for a sparse matrix stored in the BSR format (3-array variation) :

`y := A*x`

or

`y := A'*x,`

where:

x and y are vectors,

A is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, A' is the transpose of A .

NOTE

This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section "**Interfaces**" below.

<i>uplo</i>	<p>CHARACTER*1. Specifies the upper or low triangle of the matrix A is used.</p> <p>If <i>uplo</i> = 'U' or 'u', then the upper triangle of the matrix A is used.</p> <p>If <i>uplo</i> = 'L' or 'l', then the low triangle of the matrix A is used.</p>
<i>transa</i>	<p>CHARACTER*1. Specifies the operation.</p> <p>If <i>transa</i> = 'N' or 'n', then the matrix-vector product is computed as $y := A*x$</p> <p>If <i>transa</i> = 'T' or 't' or 'C' or 'c', then the matrix-vector product is computed as $y := A'*x$.</p>
<i>diag</i>	<p>CHARACTER*1. Specifies whether A is a unit triangular matrix.</p> <p>If <i>diag</i> = 'U' or 'u', then A is a unit triangular.</p> <p>If <i>diag</i> = 'N' or 'n', then A is not a unit triangular.</p>
<i>m</i>	INTEGER. Number of block rows of the matrix A .
<i>lb</i>	INTEGER. Size of the block in the matrix A .
<i>a</i>	<p>REAL for <code>mkl_sbsrtrsv</code>.</p> <p>DOUBLE PRECISION for <code>mkl_dbsrtrsv</code>.</p> <p>COMPLEX for <code>mkl_cbsrtrsv</code>.</p> <p>DOUBLE COMPLEX for <code>mkl_zbsrtrsv</code>.</p> <p>Array containing elements of non-zero blocks of the matrix A. ```

Include Files

- mkl.fi

Description

The `mkl_?cootrsv` routine solves a system of linear equations with matrix-vector operations for a sparse matrix stored in the coordinate format:

$$A \cdot y = x$$

or

$$A' \cdot y = x,$$

where:

x and y are vectors,

A is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, A' is the transpose of A .

NOTE

This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section "**Interfaces**" below.

<i>uplo</i>	<p>CHARACTER*1. Specifies whether the upper or low triangle of the matrix <i>A</i> is considered.</p> <p>If <i>uplo</i> = 'U' or 'u', then the upper triangle of the matrix <i>A</i> is used.</p> <p>If <i>uplo</i> = 'L' or 'l', then the low triangle of the matrix <i>A</i> is used.</p>

<i>colind</i>	<p>INTEGER. Array of length <i>nnz</i>, contains the column indices for each non-zero element of the matrix <i>A</i>. Refer to <i>columns</i> array description in Coordinate Format for more details.</p>
<i>nnz</i>	<p>INTEGER. Specifies the number of non-zero element of the matrix <i>A</i>.</p> <p>Refer to <i>nnz</i> description in Coordinate Format for more details.</p>
<i>x</i>	<p>REAL for mkl_scootrsv.</p> <p>DOUBLE PRECISION for mkl_dcootrsv.</p> <p>COMPLEX for mkl_ccootrsv.</p> <p>DOUBLE COMPLEX for mkl_zcootrsv.</p>

Array, size is m .

On entry, the array x must contain the vector x .

Output Parameters

y REAL for mkl_scootrsv.
 DOUBLE PRECISION for mkl_dcootrsv.
 COMPLEX for mkl_ccootrsv.
 DOUBLE COMPLEX for mkl_zcootrsv.
 Array, size at least m .
 Contains the vector y .

Interfaces

FORTRAN 77:

```

mkl_?diatrsv

Triangular solvers with simplified interface for a sparse matrix in the diagonal format with one-based indexing.

Syntax

```
call mkl_sdiatrsv(uplo, transa, diag, m, val, lval, idiag, ndiag, x, y)
call mkl_ddiatrsv(uplo, transa, diag, m, val, lval, idiag, ndiag, x, y)
call mkl_cdiatrsv(uplo, transa, diag, m, val, lval, idiag, ndiag, x, y)
call mkl_zdiatrsv(uplo, transa, diag, m, val, lval, idiag, ndiag, x, y)
```

Include Files

- mkl.fi

Description

The `mkl_?diatrsv` routine solves a system of linear equations with matrix-vector operations for a sparse matrix stored in the diagonal format:

$$A*y = x$$

or

$$A'*y = x,$$

where:

x and y are vectors,

A is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, A' is the transpose of A .

NOTE

This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section "**Interfaces**" below.

<i>uplo</i>	<p>CHARACTER*1. Specifies whether the upper or low triangle of the matrix A is used.</p> <p>If <i>uplo</i> = 'U' or 'u', then the upper triangle of the matrix A is used.</p> <p>If <i>uplo</i> = 'L' or 'l', then the low triangle of the matrix A is used.</p>
<i>transa</i>	<p>CHARACTER*1. Specifies the system of linear equations.</p> <p>If <i>transa</i> = 'N' or 'n', then $A*y = x$</p> <p>If <i>transa</i> = 'T' or 't' or 'C' or 'c', then $A'*y = x$,</p>
<i>diag</i>	<p>CHARACTER*1. Specifies whether A is unit triangular.</p> <p>If <i>diag</i> = 'U' or 'u', then A is unit triangular.</p> <p>If <i>diag</i> = 'N' or 'n', then A is not unit triangular.</p>

<i>m</i>	INTEGER. Number of rows of the matrix <i>A</i> .
<i>val</i>	<p>REAL for mkl_sdiatrsv.</p> <p>DOUBLE PRECISION for mkl_ddiatrsv.</p> <p>COMPLEX for mkl_cdiatrsv.</p> <p>DOUBLE COMPLEX for mkl_zdiatrsv.</p> <p>Two-dimensional array of size <i>lval</i> by <i>ndiag</i>, contains non-zero diagonals of the matrix <i>A</i>. Refer to <i>values</i> array description in Diagonal Storage Scheme for more details.</p>
<i>lval</i>	INTEGER. Leading dimension of <i>val</i> , $lval \geq m$. Refer to <i>lval</i> description in Diagonal Storage Scheme for more details.
<i>idiag</i>	INTEGER. Array of length <i>ndiag</i> , contains the distances between main diagonal and each non-zero diagonals in the matrix <i>A</i> .

NOTE

All elements of this array must be sorted in increasing order.

Refer to *distance* array description in [Diagonal Storage Scheme](#) for more details.

<i>ndiag</i>	INTEGER. Specifies the number of non-zero diagonals of the matrix <i>A</i> .
<i>x</i>	<p>REAL for mkl_sdiatrsv.</p> <p>DOUBLE PRECISION for mkl_ddiatrsv.</p> <p>COMPLEX for mkl_cdiatrsv.</p> <p>DOUBLE COMPLEX for mkl_zdiatrsv.</p> <p>Array, size is <i>m</i>.</p> <p>On entry, the array <i>x</i> must contain the vector <i>x</i>.</p>

Output Parameters

<i>y</i>	<p>REAL for mkl_sdiatrsv.</p> <p>DOUBLE PRECISION for mkl_ddiatrsv.</p> <p>COMPLEX for mkl_cdiatrsv.</p> <p>DOUBLE COMPLEX for mkl_zdiatrsv.</p> <p>Array, size at least <i>m</i>.</p> <p>Contains the vector <i>y</i>.</p>

mkl_cspblas_?csrgermv

Computes matrix - vector product of a sparse general matrix stored in the CSR format (3-array variation) with zero-based indexing.

Syntax

```
call mkl_cspblas_scsrgermv(transa, m, a, ia, ja, x, y)
```

```
call mkl_cspblas_dcsrgermv(transa, m, a, ia, ja, x, y)
```

```
call mkl_cspblas_ccsrgermv(transa, m, a, ia, ja, x, y)
```

```
call mkl_cspblas_zcsrgermv(transa, m, a, ia, ja, x, y)
```

Include Files

- mkl.fi

Description

The `mkl_cspblas_?csrgermv` routine performs a matrix-vector operation defined as

$$y := A * x$$

or

$$y := A' * x,$$

where:

x and y are vectors,

A is an m -by- m sparse square matrix in the CSR format (3-array variation) with zero-based indexing, A' is the transpose of A .

NOTE

This routine supports only zero-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section "**Interfaces**" below.

<i>transa</i>	<p>CHARACTER*1. Specifies the operation.</p> <p>If <i>transa</i> = 'N' or 'n', then the matrix-vector product is computed as $y := A * x$</p> <p>If <i>transa</i> = 'T' or 't' or 'C' or 'c', then the matrix-vector product is computed as $y := A' * x$,</p>
<i>m</i>	INTEGER. Number of rows of the matrix A .
<i>a</i>	<p>REAL for <code>mkl_cspblas_scsrgermv</code>.</p> <p>DOUBLE PRECISION for <code>mkl_cspblas_dcsrgermv</code>.</p> <p>COMPLEX for <code>mkl_cspblas_ccsrgermv</code>.</p> <p>DOUBLE COMPLEX for <code>mkl_cspblas_zcsrgermv</code>.</p> <p>Array containing non-zero elements of the matrix A. Its length is equal to the number of non-zero elements in the matrix A. Refer to <i>values</i> array description in Sparse Matrix Storage Formats for more details.</p>
<i>ia</i>	<p>INTEGER. Array of length $m + 1$, containing indices of elements in the array a, such that $ia(I)$ is the index in the array a of the first non-zero element from the row I. The value of the last element $ia(m)$ is equal to the number of non-zeros. Refer to <i>rowIndex</i> array description in Sparse Matrix Storage Formats for more details.</p>
<i>ja</i>	<p>INTEGER. Array containing the column indices for each non-zero element of the matrix A.</p> <p>Its length is equal to the length of the array a. Refer to <i>columns</i> array description in Sparse Matrix Storage Formats for more details.</p>
<i>x</i>	<p>REAL for <code>mkl_cspblas_scsrgermv</code>.</p> <p>DOUBLE PRECISION for <code>mkl_cspblas_dcsrgermv</code>.</p>

COMPLEX for mkl_cspblas_ccsrgemv.

DOUBLE COMPLEX for mkl_cspblas_zcsrgemv.

Array, size is m .

One entry, the array x must contain the vector x .

Output Parameters

y

REAL for mkl_cspblas_scsrgemv.

DOUBLE PRECISION for mkl_cspblas_dcsrgemv.

COMPLEX for mkl_cspblas_ccsrgemv.

DOUBLE COMPLEX for mkl_cspblas_zcsrgemv.

Array, size at least m .

On exit, the array y must contain the vector y .

Interfaces

FORTRAN 77:

```

```
DOUBLE COMPLEX a(*), x(*), y(*)
```

mkl_cspblas_?bsrgemv

Computes matrix - vector product of a sparse general matrix stored in the BSR format (3-array variation) with zero-based indexing.

Syntax

```
call mkl_cspblas_sbsrgemv(transa, m, lb, a, ia, ja, x, y)
call mkl_cspblas_dbsrgemv(transa, m, lb, a, ia, ja, x, y)
call mkl_cspblas_cbsrgemv(transa, m, lb, a, ia, ja, x, y)
call mkl_cspblas_zbsrgemv(transa, m, lb, a, ia, ja, x, y)
```

Include Files

- mkl.fi

Description

The mkl_cspblas_?bsrgemv routine performs a matrix-vector operation defined as

$$y := A * x$$

or

$$y := A' * x,$$

where:

x and y are vectors,

A is an m -by- m block sparse square matrix in the BSR format (3-array variation) with zero-based indexing, A' is the transpose of A .

NOTE

This routine supports only zero-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section "**Interfaces**" below.

<i>transa</i>	CHARACTER*1. Specifies the operation. If <i>transa</i> = 'N' or 'n', then the matrix-vector product is computed as $y := A * x$ If <i>transa</i> = 'T' or 't' or 'C' or 'c', then the matrix-vector product is computed as $y := A' * x$,
<i>m</i>	INTEGER. Number of block rows of the matrix A .
<i>lb</i>	INTEGER. Size of the block in the matrix A .
<i>a</i>	REAL for mkl_cspblas_sbsrgemv. DOUBLE PRECISION for mkl_cspblas_dbsrgemv. COMPLEX for mkl_cspblas_cbsrgemv.

DOUBLE COMPLEX for mkl_cspblas_zbsrgemv.

Array containing elements of non-zero blocks of the matrix A . Its length is equal to the number of non-zero blocks in the matrix A multiplied by $lb*lb$. Refer to *values* array description in [BSR Format](#) for more details.

ia INTEGER. Array of length $(m + 1)$, containing indices of block in the array a , such that $ia(i)$ is the index in the array a of the first non-zero element from the row i . The value of the last element $ia(m + 1)$ is equal to the number of non-zero blocks. Refer to *rowIndex* array description in [BSR Format](#) for more details.

ja INTEGER. Array containing the column indices for each non-zero block in the matrix A .
Its length is equal to the number of non-zero blocks of the matrix A . Refer to *columns* array description in [BSR Format](#) for more details.

x REAL for mkl_cspblas_sbsrgemv.
DOUBLE PRECISION for mkl_cspblas_dbsrgemv.
COMPLEX for mkl_cspblas_cbsrgemv.
DOUBLE COMPLEX for mkl_cspblas_zbsrgemv.
Array, size $(m*lb)$.
On entry, the array x must contain the vector x .

Output Parameters

y REAL for mkl_cspblas_sbsrgemv.
DOUBLE PRECISION for mkl_cspblas_dbsrgemv.
COMPLEX for mkl_cspblas_cbsrgemv.
DOUBLE COMPLEX for mkl_cspblas_zbsrgemv.
Array, size at least $(m*lb)$.
On exit, the array y must contain the vector y .

mkl_cspblas_?coogemv

Computes matrix - vector product of a sparse general matrix stored in the coordinate format with zero-based indexing.

Syntax

```
call mkl_cspblas_scoogemv(transa, m, val, rowind, colind, nnz, x, y)
```

```
call mkl_cspblas_dcoogemv(transa, m, val, rowind, colind, nnz, x, y)
```

```
call mkl_cspblas_ccoogemv(transa, m, val, rowind, colind, nnz, x, y)
```

```
call mkl_cspblas_zcoogemv(transa, m, val, rowind, colind, nnz, x, y)
```

Include Files

- mkl.fi

Description

The `mkl_cspblas_dcoogemv` routine performs a matrix-vector operation defined as

```
y := A*x
```

or

```
y := A'*x,
```

where:

x and y are vectors,

A is an m -by- m sparse square matrix in the coordinate format with zero-based indexing, A' is the transpose of A .

NOTE

This routine supports only zero-based indexing of the input arrays.

Input Parameters

mkl_cspblas_?csrsvmv

Computes matrix-vector product of a sparse symmetrical matrix stored in the CSR format (3-array variation) with zero-based indexing.

Syntax

```
call mkl_cspblas_scsrsvmv(uplo, m, a, ia, ja, x, y)
```

```
call mkl_cspblas_dcsrsvmv(uplo, m, a, ia, ja, x, y)
```

```
call mkl_cspblas_ccsrsvmv(uplo, m, a, ia, ja, x, y)
```

```
call mkl_cspblas_zcsrsvmv(uplo, m, a, ia, ja, x, y)
```

Include Files

- `mkl.fi`

Description

The `mkl_cspblas_?csrsvmv` routine performs a matrix-vector operation defined as

```
y := A*x
```

where:

x and y are vectors,

A is an upper or lower triangle of the symmetrical sparse matrix in the CSR format (3-array variation) with zero-based indexing.

NOTE

This routine supports only zero-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section "**Interfaces**" below.

<i>uplo</i>	<p>CHARACTER*1. Specifies whether the upper or low triangle of the matrix A is used.</p> <p>If <i>uplo</i> = 'U' or 'u', then the upper triangle of the matrix A is used.</p> <p>If <i>uplo</i> = 'L' or 'l', then the low triangle of the matrix A is used.</p>

mkl_cspblas_?bsrsymv

Computes matrix-vector product of a sparse symmetrical matrix stored in the BSR format (3-arrays variation) with zero-based indexing.

Syntax

```
call mkl_cspblas_sbsrsymv(uplo, m, lb, a, ia, ja, x, y)
```

```
call mkl_cspblas_dbsrsymv(uplo, m, lb, a, ia, ja, x, y)
```

```
call mkl_cspblas_cbsrsymv(uplo, m, lb, a, ia, ja, x, y)
```

```
call mkl_cspblas_zbsrsymv(uplo, m, lb, a, ia, ja, x, y)
```

Include Files

- mkl.fi

Description

The `mkl_cspblas_?bsrsymv` routine performs a matrix-vector operation defined as

```
y := A*x
```

where:

x and y are vectors,

A is an upper or lower triangle of the symmetrical sparse matrix in the BSR format (3-array variation) with zero-based indexing.

NOTE

This routine supports only zero-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section "**Interfaces**" below.

uplo CHARACTER*1. Specifies whether the upper or low triangle of the matrix A is used.

If *uplo* = 'U' or 'u', then the upper triangle of the matrix A is used.

If *uplo* = 'L' or 'l', then the low triangle of the matrix A is used.

m INTEGER. Number of block rows of the matrix A .

<i>lb</i>	INTEGER. Size of the block in the matrix <i>A</i> .
<i>a</i>	<p>REAL for mkl_cspblas_sbsrsymv. DOUBLE PRECISION for mkl_cspblas_dbsrsymv. COMPLEX for mkl_cspblas_cbsrsymv. DOUBLE COMPLEX for mkl_cspblas_zbsrsymv.</p> <p>Array containing elements of non-zero blocks of the matrix <i>A</i>. Its length is equal to the number of non-zero blocks in the matrix <i>A</i> multiplied by $lb*lb$. Refer to <i>values</i> array description in BSR Format for more details.</p>
<i>ia</i>	<p>INTEGER. Array of length $(m + 1)$, containing indices of block in the array <i>a</i>, such that <i>ia</i>(<i>i</i>) is the index in the array <i>a</i> of the first non-zero element from the row <i>i</i>. The value of the last element <i>ia</i>($m + 1$) is equal to the number of non-zero blocks plus one. Refer to <i>rowIndex</i> array description in BSR Format for more details.</p>
<i>ja</i>	<p>INTEGER. Array containing the column indices for each non-zero block in the matrix <i>A</i>.</p> <p>Its length is equal to the number of non-zero blocks of the matrix <i>A</i>. Refer to <i>columns</i> array description in BSR Format for more details.</p>
<i>x</i>	<p>REAL for mkl_cspblas_sbsrsymv. DOUBLE PRECISION for mkl_cspblas_dbsrsymv. COMPLEX for mkl_cspblas_cbsrsymv. DOUBLE COMPLEX for mkl_cspblas_zbsrsymv.</p> <p>Array, size $(m*lb)$.</p> <p>On entry, the array <i>x</i> must contain the vector <i>x</i>.</p>

Output Parameters

<i>y</i>	<p>REAL for mkl_cspblas_sbsrsymv. DOUBLE PRECISION for mkl_cspblas_dbsrsymv. COMPLEX for mkl_cspblas_cbsrsymv. DOUBLE COMPLEX for mkl_cspblas_zbsrsymv.</p> <p>Array, size at least $(m*lb)$.</p> <p>On exit, the array <i>y</i> must contain the vector <i>y</i>.</p>

call mkl_cspblas_ccsrtrsv(uplo, transa, diag, m, a, ia, ja, x, y)
```

```
call mkl_cspblas_zcsrtrsv(uplo, transa, diag, m, a, ia, ja, x, y)
```

Include Files

- mkl.fi

Description

The `mkl_cspblas_?csrtrsv` routine solves a system of linear equations with matrix-vector operations for a sparse matrix stored in the CSR format (3-array variation) with zero-based indexing:

$$A * y = x$$

or

$$A' * y = x,$$

where:

x and y are vectors,

A is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, A' is the transpose of A .

NOTE

This routine supports only zero-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section "**Interfaces**" below.

<i>uplo</i>	<p>CHARACTER*1. Specifies whether the upper or low triangle of the matrix A is used.</p> <p>If <i>uplo</i> = 'U' or 'u', then the upper triangle of the matrix A is used.</p> <p>If <i>uplo</i> = 'L' or 'l', then the low triangle of the matrix A is used.</p>
<i>transa</i>	<p>CHARACTER*1. Specifies the system of linear equations.</p> <p>If <i>transa</i> = 'N' or 'n', then $A * y = x$</p> <p>If <i>transa</i> = 'T' or 't' or 'C' or 'c', then $A' * y = x$,</p>
<i>diag</i>	<p>CHARACTER*1. Specifies whether matrix A is unit triangular.</p> <p>If <i>diag</i> = 'U' or 'u', then A is unit triangular.</p> <p>If <i>diag</i> = 'N' or 'n', then A is not unit triangular.</p>
<i>m</i>	INTEGER. Number of rows of the matrix A .
<i>a</i>	<p>REAL for <code>mkl_cspblas_scsrtrsv</code>.</p> <p>DOUBLE PRECISION for <code>mkl_cspblas_dcsrtrsv</code>.</p> <p>COMPLEX for <code>mkl_cspblas_ccsrtrsv</code>.</p> <p>DOUBLE COMPLEX for <code>mkl_cspblas_zcsrtrsv</code>.</p> <p>Array containing non-zero elements of the matrix A. Its length is equal to the number of non-zero elements in the matrix A. Refer to <i>values</i> array description in Sparse Matrix Storage Formats for more details.</p>

NOTE

The non-zero elements of the given row of the matrix must be stored in the same order as they appear in the row (from left to right).

No diagonal element can be omitted from a sparse storage if the solver is called with the non-unit indicator.

ia INTEGER. Array of length $m+1$, containing indices of elements in the array *a*, such that *ia*(*i*) is the index in the array *a* of the first non-zero element from the row *i*. The value of the last element *ia*(*m*) is equal to the number of non-zeros. Refer to *rowIndex* array description in [Sparse Matrix Storage Formats](#) for more details.

ja INTEGER. Array containing the column indices for each non-zero element of the matrix *A*.

Its length is equal to the length of the array *a*. Refer to *columns* array description in [Sparse Matrix Storage Formats](#) for more details.

NOTE

Column indices must be sorted in increasing order for each row.

x REAL for mkl_cspblas_scsrtrsv.
DOUBLE PRECISION for mkl_cspblas_dcsrtrsv.
COMPLEX for mkl_cspblas_ccsrtrsv.
DOUBLE COMPLEX for mkl_cspblas_zcsrtrsv.
Array, size is *m*.
On entry, the array *x* must contain the vector *x*.

Output Parameters

y REAL for mkl_cspblas_scsrtrsv.
DOUBLE PRECISION for mkl_cspblas_dcsrtrsv.
COMPLEX for mkl_cspblas_ccsrtrsv.
DOUBLE COMPLEX for mkl_cspblas_zcsrtrsv.
Array, size at least *m*.
Contains the vector *y*.

mkl_cspblas_?bsrtrsv

Triangular solver with simplified interface for a sparse matrix stored in the BSR format (3-array variation) with zero-based indexing.

Syntax

```
call mkl_cspblas_sbsrtrsv(uplo, transa, diag, m, lb, a, ia, ja, x, y)
```

```
call mkl_cspblas_dbsrtrsv(uplo, transa, diag, m, lb, a, ia, ja, x, y)
```

```
call mkl_cspblas_cbsrtrsv(uplo, transa, diag, m, lb, a, ia, ja, x, y)
```

```
call mkl_cspblas_zbsrtrsv(uplo, transa, diag, m, lb, a, ia, ja, x, y)
```

Include Files

- mkl.fi

Description

The `mkl_cspblas_?bsrtrsv` routine solves a system of linear equations with matrix-vector operations for a sparse matrix stored in the BSR format (3-array variation) with zero-based indexing:

```
y := A*x
```

or

```
y := A'*x,
```

where:

x and y are vectors,

A is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, A' is the transpose of A .

NOTE

This routine supports only zero-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section "**Interfaces**" below.

<i>uplo</i>	<p>CHARACTER*1. Specifies the upper or low triangle of the matrix <i>A</i> is used.</p> <p>If <i>uplo</i> = 'U' or 'u', then the upper triangle of the matrix <i>A</i> is used.</p> <p>If <i>uplo</i> = 'L' or 'l', then the low triangle of the matrix <i>A</i> is used.</p>
<i>transa</i>	<p>CHARACTER*1. Specifies the operation.</p> <p>If <i>transa</i> = 'N' or 'n', then the matrix-vector product is computed as $y := A*x$</p> <p>If <i>transa</i> = 'T' or 't' or 'C' or 'c', then the matrix-vector product is computed as $y := A'*x$.</p>
<i>diag</i>	<p>CHARACTER*1. Specifies whether matrix <i>A</i> is unit triangular or not.</p> <p>If <i>diag</i> = 'U' or 'u', <i>A</i> is unit triangular.</p> <p>If <i>diag</i> = 'N' or 'n', <i>A</i> is not unit triangular.</p>
<i>m</i>	INTEGER. Number of block rows of the matrix <i>A</i> .
<i>lb</i>	INTEGER. Size of the block in the matrix <i>A</i> .
<i>a</i>	<p>REAL for mkl_cspblas_sbsrtrsv.</p> <p>DOUBLE PRECISION for mkl_cspblas_dbsrtrsv.</p> <p>COMPLEX for mkl_cspblas_cbsrtrsv.</p> <p>DOUBLE COMPLEX for mkl_cspblas_zbsrtrsv.</p> <p>Array containing elements of non-zero blocks of the matrix <i>A</i>. Its length is equal to the number of non-zero blocks in the matrix <i>A</i> multiplied by $lb*lb$. Refer to <i>values</i> array description in BSR Format for more details.</p>

NOTE

The non-zero elements of the given row of the matrix must be stored in the same order as they appear in the row (from left to right).

No diagonal element can be omitted from a sparse storage if the solver is called with the non-unit indicator.

<i>ia</i>	<p>INTEGER. Array of length $(m + 1)$, containing indices of block in the array <i>a</i>, such that $ia(I)$ is the index in the array <i>a</i> of the first non-zero element from the row <i>I</i>. The value of the last element $ia(m + 1)$ is equal to the number of non-zero blocks. Refer to <i>rowIndex</i> array description in BSR Format for more details.</p>
-----------	--

ja INTEGER. Array containing the column indices for each non-zero block in the matrix *A*.
 Its length is equal to the number of non-zero blocks of the matrix *A*. Refer to *columns* array description in [BSR Format](#) for more details.

x REAL for mkl_cspblas_sbsrtrsv.
 DOUBLE PRECISION for mkl_cspblas_dbsrtrsv.
 COMPLEX for mkl_cspblas_cbsrtrsv.
 DOUBLE COMPLEX for mkl_cspblas_zbsrtrsv.
 Array, size $(m \times lb)$.
 On entry, the array *x* must contain the vector *x*.

Output Parameters

y REAL for mkl_cspblas_sbsrtrsv.
 DOUBLE PRECISION for mkl_cspblas_dbsrtrsv.
 COMPLEX for mkl_cspblas_cbsrtrsv.
 DOUBLE COMPLEX for mkl_cspblas_zbsrtrsv.
 Array, size at least $(m \times lb)$.
 On exit, the array *y* must contain the vector *y*.

```

```
call mkl_cspblas_zcootrsv(uplo, transa, diag, m, val, rowind, colind, nnz, x, y)
```

Include Files

- mkl.fi

Description

The mkl_cspblas_?cootrsv routine solves a system of linear equations with matrix-vector operations for a sparse matrix stored in the coordinate format with zero-based indexing:

```
 $A * y = x$ 
```

or

```
 $A' * y = x,$ 
```

where:

x and y are vectors,

A is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, A' is the transpose of A .

NOTE

This routine supports only zero-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section "**Interfaces**" below.

uplo

CHARACTER*1. Specifies whether the upper or low triangle of the matrix A is considered.

If *uplo* = 'U' or 'u', then the upper triangle of the matrix A is used.

If *uplo* = 'L' or 'l', then the low triangle of the matrix A is used.

<i>transa</i>	<p>CHARACTER*1. Specifies the system of linear equations.</p> <p>If <i>transa</i> = 'N' or 'n', then $A*y = x$</p> <p>If <i>transa</i> = 'T' or 't' or 'C' or 'c', then $A'*y = x$,</p>
<i>diag</i>	<p>CHARACTER*1. Specifies whether <i>A</i> is unit triangular.</p> <p>If <i>diag</i> = 'U' or 'u', then <i>A</i> is unit triangular.</p> <p>If <i>diag</i> = 'N' or 'n', then <i>A</i> is not unit triangular.</p>

Description

The mkl_?csr_{mv} routine performs a matrix-vector operation defined as

```
y := alpha*A*x + beta*y
```

or

$$y := \alpha A'^*x + \beta y,$$

where:

α and β are scalars,

x and y are vectors,

A is an m -by- k sparse matrix in the CSR format, A' is the transpose of A .

NOTE

This routine supports a CSR format both with one-based indexing and zero-based indexing.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section "**Interfaces**" below.

<i>transa</i>	<p>CHARACTER*1. Specifies the operation.</p> <p>If <i>transa</i> = 'N' or 'n', then $y := \alpha A^*x + \beta y$</p> <p>If <i>transa</i> = 'T' or 't' or 'C' or 'c', then $y := \alpha A'^*x + \beta y$,</p>
<i>m</i>	INTEGER. Number of rows of the matrix A .
<i>k</i>	INTEGER. Number of columns of the matrix A .
<i>alpha</i>	<p>REAL for mkl_scsrnmv.</p> <p>DOUBLE PRECISION for mkl_dcsrnmv.</p> <p>COMPLEX for mkl_ccsrnmv.</p> <p>DOUBLE COMPLEX for mkl_zcsrnmv.</p> <p>Specifies the scalar α.</p>
<i>matdescra</i>	<p>CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table "Possible Values of the Parameter <i>matdescra</i> (<i>descra</i>)". Possible combinations of element values of this parameter are given in Table "Possible Combinations of Element Values of the Parameter <i>matdescra</i>".</p>
<i>val</i>	<p>REAL for mkl_scsrnmv.</p> <p>DOUBLE PRECISION for mkl_dcsrnmv.</p> <p>COMPLEX for mkl_ccsrnmv.</p> <p>DOUBLE COMPLEX for mkl_zcsrnmv.</p> <p>Array containing non-zero elements of the matrix A.</p> <p>For one-based indexing its length is $pntrb(m) - pntrb(1)$.</p> <p>For zero-based indexing its length is $pntrb(m-1) - pntrb(0)$.</p> <p>Refer to <i>values</i> array description in CSR Format for more details.</p>

<i>indx</i>	<p>INTEGER. Array containing the column indices for each non-zero element of the matrix <i>A</i>.</p> <p>Its length is equal to length of the <i>val</i> array.</p> <p>Refer to <i>columns</i> array description in CSR Format for more details.</p>
<i>pntrb</i>	<p>INTEGER. Array of length <i>m</i>.</p> <p>For one-based indexing this array contains row indices, such that <i>pntrb</i>(<i>i</i>) - <i>pntrb</i>(1) + 1 is the first index of row <i>i</i> in the arrays <i>val</i> and <i>indx</i>.</p> <p>For zero-based indexing this array contains row indices, such that <i>pntrb</i>(<i>i</i>) - <i>pntrb</i>(0) is the first index of row <i>i</i> in the arrays <i>val</i> and <i>indx</i>.</p> <p>Refer to <i>pointerb</i> array description in CSR Format for more details.</p>
<i>pntrr</i>	<p>INTEGER. Array of length <i>m</i>.</p> <p>For one-based indexing this array contains row indices, such that <i>pntrr</i>(<i>i</i>) - <i>pntrb</i>(1) is the last index of row <i>i</i> in the arrays <i>val</i> and <i>indx</i>.</p> <p>For zero-based indexing this array contains row indices, such that <i>pntrr</i>(<i>i</i>) - <i>pntrb</i>(0) - 1 is the last index of row <i>i</i> in the arrays <i>val</i> and <i>indx</i>.</p> <p>Refer to <i>pointerE</i> array description in CSR Format for more details.</p>
<i>x</i>	<p>REAL for <code>mkl_scsrmv</code>.</p> <p>DOUBLE PRECISION for <code>mkl_dcscrmv</code>.</p> <p>COMPLEX for <code>mkl_ccsrmv</code>.</p> <p>DOUBLE COMPLEX for <code>mkl_zcsrmv</code>.</p> <p>Array, size at least <i>k</i> if <i>transa</i> = 'N' or 'n' and at least <i>m</i> otherwise. On entry, the array <i>x</i> must contain the vector <i>x</i>.</p>
<i>beta</i>	<p>REAL for <code>mkl_scsrmv</code>.</p> <p>DOUBLE PRECISION for <code>mkl_dcscrmv</code>.</p> <p>COMPLEX for <code>mkl_ccsrmv</code>.</p> <p>DOUBLE COMPLEX for <code>mkl_zcsrmv</code>.</p> <p>Specifies the scalar <i>beta</i>.</p>
<i>y</i>	<p>REAL for <code>mkl_scsrmv</code>.</p> <p>DOUBLE PRECISION for <code>mkl_dcscrmv</code>.</p> <p>COMPLEX for <code>mkl_ccsrmv</code>.</p> <p>DOUBLE COMPLEX for <code>mkl_zcsrmv</code>.</p> <p>Array, size at least <i>m</i> if <i>transa</i> = 'N' or 'n' and at least <i>k</i> otherwise. On entry, the array <i>y</i> must contain the vector <i>y</i>.</p>

Output Parameters

<i>y</i>	Overwritten by the updated vector <i>y</i> .

mkl_?bsrmv

Computes matrix - vector product of a sparse matrix stored in the BSR format.

Syntax

```
call mkl_sbsrmv(transa, m, k, lb, alpha, matdescra, val, indx, pntreb, pntre, x, beta,
y)
call mkl_dbsrmv(transa, m, k, lb, alpha, matdescra, val, indx, pntreb, pntre, x, beta,
y)
call mkl_cbsrmv(transa, m, k, lb, alpha, matdescra, val, indx, pntreb, pntre, x, beta,
y)
call mkl_zbsrmv(transa, m, k, lb, alpha, matdescra, val, indx, pntreb, pntre, x, beta,
y)
```

Include Files

- mkl.fi

Description

The mkl_?bsrmv routine performs a matrix-vector operation defined as

$$y := \alpha A x + \beta y$$

or

$$y := \alpha A' x + \beta y,$$

where:

α and β are scalars,

x and y are vectors,

A is an m -by- k block sparse matrix in the BSR format, A' is the transpose of A .

NOTE

This routine supports a BSR format both with one-based indexing and zero-based indexing.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section "**Interfaces**" below.

<i>transa</i>	CHARACTER*1. Specifies the operation. If <i>transa</i> = 'N' or 'n', then the matrix-vector product is computed as $y := \alpha A x + \beta y$ If <i>transa</i> = 'T' or 't' or 'C' or 'c', then the matrix-vector product is computed as $y := \alpha A' x + \beta y$,
<i>m</i>	INTEGER. Number of block rows of the matrix A .
<i>k</i>	INTEGER. Number of block columns of the matrix A .

<i>lb</i>	INTEGER. Size of the block in the matrix <i>A</i> .
<i>alpha</i>	<p>REAL for <code>mkl_sbsrmv</code>.</p> <p>DOUBLE PRECISION for <code>mkl_dbsrmv</code>.</p> <p>COMPLEX for <code>mkl_cbsrmv</code>.</p> <p>DOUBLE COMPLEX for <code>mkl_zbsrmv</code>.</p> <p>Specifies the scalar <i>alpha</i>.</p>
<i>matdescra</i>	<p>CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table "Possible Values of the Parameter <i>matdescra</i> (<i>descra</i>)". Possible combinations of element values of this parameter are given in Table "Possible Combinations of Element Values of the Parameter <i>matdescra</i>".</p>
<i>val</i>	<p>REAL for <code>mkl_sbsrmv</code>.</p> <p>DOUBLE PRECISION for <code>mkl_dbsrmv</code>.</p> <p>COMPLEX for <code>mkl_cbsrmv</code>.</p> <p>DOUBLE COMPLEX for <code>mkl_zbsrmv</code>.</p> <p>Array containing elements of non-zero blocks of the matrix <i>A</i>. Its length is equal to the number of non-zero blocks in the matrix <i>A</i> multiplied by $lb \times lb$.</p> <p>Refer to <i>values</i> array description in BSR Format for more details.</p>
<i>indx</i>	<p>INTEGER. Array containing the column indices for each non-zero block in the matrix <i>A</i>.</p> <p>Its length is equal to the number of non-zero blocks in the matrix <i>A</i>.</p> <p>Refer to <i>columns</i> array description in BSR Format for more details.</p>
<i>pntrb</i>	<p>INTEGER. Array of length <i>m</i>.</p> <p>For one-based indexing: this array contains row indices, such that $pntrb(i) - pntrb(1) + 1$ is the first index of block row <i>i</i> in the array <i>indx</i>.</p> <p>For zero-based indexing: this array contains row indices, such that $pntrb(i) - pntrb(0)$ is the first index of block row <i>i</i> in the array <i>indx</i>.</p> <p>Refer to <i>pointerB</i> array description in BSR Format for more details.</p>
<i>pntrb</i>	<p>INTEGER. Array of length <i>m</i>.</p> <p>For one-based indexing this array contains row indices, such that $pntrb(i) - pntrb(1)$ is the last index of block row <i>i</i> in the array <i>indx</i>.</p> <p>For zero-based indexing this array contains row indices, such that $pntrb(i) - pntrb(0) - 1$ is the last index of block row <i>i</i> in the array <i>indx</i>.</p> <p>Refer to <i>pointerE</i> array description in BSR Format for more details.</p>
<i>x</i>	<p>REAL for <code>mkl_sbsrmv</code>.</p> <p>DOUBLE PRECISION for <code>mkl_dbsrmv</code>.</p>

COMPLEX for mkl_cbsrmv.

DOUBLE COMPLEX for mkl_zbsrmv.

Array, size at least $(k*lb)$ if *transa* = 'N' or 'n', and at least $(m*lb)$ otherwise. On entry, the array *x* must contain the vector *x*.

beta

REAL for mkl_sbsrmv.

DOUBLE PRECISION for mkl_dbsrmv.

COMPLEX for mkl_cbsrmv.

DOUBLE COMPLEX for mkl_zbsrmv.

Specifies the scalar *beta*.

y

REAL for mkl_sbsrmv.

DOUBLE PRECISION for mkl_dbsrmv.

COMPLEX for mkl_cbsrmv.

DOUBLE COMPLEX for mkl_zbsrmv.

Array, size at least $(m*lb)$ if *transa* = 'N' or 'n', and at least $(k*lb)$ otherwise. On entry, the array *y* must contain the vector *y*.

Output Parameters

y

Overwritten by the updated vector *y*.

mkl_?cscmv

Computes matrix-vector product for a sparse matrix in the CSC format.

Syntax

```

call mkl_scscmv(transa, m, k, alpha, matdescra, val, indx, pntrb, pntre, x, beta, y)
call mkl_dcscmv(transa, m, k, alpha, matdescra, val, indx, pntrb, pntre, x, beta, y)
call mkl_ccscmv(transa, m, k, alpha, matdescra, val, indx, pntrb, pntre, x, beta, y)
call mkl_zcscmv(transa, m, k, alpha, matdescra, val, indx, pntrb, pntre, x, beta, y)

```

Include Files

- mkl.fi

Description

The `mkl_?cscmv` routine performs a matrix-vector operation defined as

```
y := alpha*A*x + beta*y
```

or

```
y := alpha*A'*x + beta*y,
```

where:

alpha and *beta* are scalars,

x and *y* are vectors,

A is an *m*-by-*k* sparse matrix in compressed sparse column (CSC) format, *A'* is the transpose of *A*.

NOTE

This routine supports CSC format both with one-based indexing and zero-based indexing.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

<i>transa</i>	<p>CHARACTER*1. Specifies the operation.</p> <p>If <i>transa</i> = 'N' or 'n', then $y := \alpha * A * x + \beta * y$</p> <p>If <i>transa</i> = 'T' or 't' or 'C' or 'c', then $y := \alpha * A' * x + \beta * y$,</p>
<i>m</i>	INTEGER. Number of rows of the matrix <i>A</i> .
<i>k</i>	INTEGER. Number of columns of the matrix <i>A</i> .
<i>alpha</i>	<p>REAL for mkl_scscmv.</p> <p>DOUBLE PRECISION for mkl_dcscmv.</p> <p>COMPLEX for mkl_ccscmv.</p> <p>DOUBLE COMPLEX for mkl_zcscmv.</p> <p>Specifies the scalar <i>alpha</i>.</p>
<i>matdescra</i>	<p>CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table "Possible Values of the Parameter <i>matdescra</i> (<i>descra</i>)". Possible combinations of element values of this parameter are given in Table "Possible Combinations of Element Values of the Parameter <i>matdescra</i>".</p>
<i>val</i>	<p>REAL for mkl_scscmv.</p> <p>DOUBLE PRECISION for mkl_dcscmv.</p> <p>COMPLEX for mkl_ccscmv.</p> <p>DOUBLE COMPLEX for mkl_zcscmv.</p> <p>Array containing non-zero elements of the matrix <i>A</i>.</p> <p>For one-based indexing its length is $pntre(k) - pntrb(1)$.</p> <p>For zero-based indexing its length is $pntre(m-1) - pntrb(0)$.</p> <p>Refer to <i>values</i> array description in CSC Format for more details.</p>
<i>indx</i>	<p>INTEGER. Array containing the row indices for each non-zero element of the matrix <i>A</i>.</p> <p>Its length is equal to length of the <i>val</i> array.</p> <p>Refer to <i>rows</i> array description in CSC Format for more details.</p>
<i>pntrb</i>	INTEGER. Array of length <i>k</i> .

For one-based indexing this array contains column indices, such that $\text{pntrb}(i) - \text{pntrb}(1) + 1$ is the first index of column i in the arrays *val* and *indx*.

For zero-based indexing this array contains column indices, such that $\text{pntrb}(i) - \text{pntrb}(0)$ is the first index of column i in the arrays *val* and *indx*.

Refer to *pointerb* array description in [CSC Format](#) for more details.

pntrc

INTEGER. Array of length k .

For one-based indexing this array contains column indices, such that $\text{pntrc}(i) - \text{pntrb}(1)$ is the last index of column i in the arrays *val* and *indx*.

For zero-based indexing this array contains column indices, such that $\text{pntrc}(i) - \text{pntrb}(1) - 1$ is the last index of column i in the arrays *val* and *indx*.

Refer to *pointerE* array description in [CSC Format](#) for more details.

x

REAL for `mkl_scscmv`.

DOUBLE PRECISION for `mkl_dcscmv`.

COMPLEX for `mkl_ccscmv`.

DOUBLE COMPLEX for `mkl_zcscmv`.

Array, size at least k if *transa* = 'N' or 'n' and at least m otherwise. On entry, the array *x* must contain the vector *x*.

beta

REAL for `mkl_scscmv`.

DOUBLE PRECISION for `mkl_dcscmv`.

COMPLEX for `mkl_ccscmv`.

DOUBLE COMPLEX for `mkl_zcscmv`.

Specifies the scalar *beta*.

y

REAL for `mkl_scscmv`.

DOUBLE PRECISION for `mkl_dcscmv`.

COMPLEX for `mkl_ccscmv`.

DOUBLE COMPLEX for `mkl_zcscmv`.

Array, size at least m if *transa* = 'N' or 'n' and at least k otherwise. On entry, the array *y* must contain the vector *y*.

Output Parameters

y

Overwritten by the updated vector *y*.

mkl_?coomv

Computes matrix - vector product for a sparse matrix in the coordinate format.

Syntax

```
call mkl_scoomv(transa, m, k, alpha, matdescra, val, rowind, colind, nnz, x, beta, y)
call mkl_dcoomv(transa, m, k, alpha, matdescra, val, rowind, colind, nnz, x, beta, y)
call mkl_ccoomv(transa, m, k, alpha, matdescra, val, rowind, colind, nnz, x, beta, y)
call mkl_zcoomv(transa, m, k, alpha, matdescra, val, rowind, colind, nnz, x, beta, y)
```

Include Files

- mkl.fi

Description

The mkl_?coomv routine performs a matrix-vector operation defined as

```
y := alpha*A*x + beta*y
```

or

```
y := alpha*A'*x + beta*y,
```

where:

alpha and *beta* are scalars,

x and *y* are vectors,

A is an *m*-by-*k* sparse matrix in compressed coordinate format, *A'* is the transpose of *A*.

NOTE

This routine supports a coordinate format both with one-based indexing and zero-based indexing.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section "**Interfaces**" below.

<i>transa</i>	CHARACTER*1. Specifies the operation. If <i>transa</i> = 'N' or 'n', then $y := \alpha A x + \beta y$ If <i>transa</i> = 'T' or 't' or 'C' or 'c', then $y := \alpha A' x + \beta y$,
<i>m</i>	INTEGER. Number of rows of the matrix <i>A</i> .
<i>k</i>	INTEGER. Number of columns of the matrix <i>A</i> .
<i>alpha</i>	REAL for mkl_scoomv. DOUBLE PRECISION for mkl_dcoomv. COMPLEX for mkl_ccoomv. DOUBLE COMPLEX for mkl_zcoomv.

Specifies the scalar *alpha*.

matdescra

CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in [Table "Possible Values of the Parameter *matdescra* \(*descra*\)"](#). Possible combinations of element values of this parameter are given in [Table "Possible Combinations of Element Values of the Parameter *matdescra*"](#).

val

REAL for `mkl_scoomv`.

DOUBLE PRECISION for `mkl_dcoomv`.

COMPLEX for `mkl_ccoomv`.

DOUBLE COMPLEX for `mkl_zcoomv`.

Array of length *nnz*, contains non-zero elements of the matrix *A* in the arbitrary order.

Refer to *values* array description in [Coordinate Format](#) for more details.

rowind

INTEGER. Array of length *nnz*, contains the row indices for each non-zero element of the matrix *A*.

Refer to *rows* array description in [Coordinate Format](#) for more details.

colind

INTEGER. Array of length *nnz*, contains the column indices for each non-zero element of the matrix *A*.

Refer to *columns* array description in [Coordinate Format](#) for more details.

nnz

INTEGER. Specifies the number of non-zero element of the matrix *A*.

Refer to *nnz* description in [Coordinate Format](#) for more details.

x

REAL for `mkl_scoomv`.

DOUBLE PRECISION for `mkl_dcoomv`.

COMPLEX for `mkl_ccoomv`.

DOUBLE COMPLEX for `mkl_zcoomv`.

Array, size at least *k* if *transa* = 'N' or 'n' and at least *m* otherwise. On entry, the array *x* must contain the vector *x*.

beta

REAL for `mkl_scoomv`.

DOUBLE PRECISION for `mkl_dcoomv`.

COMPLEX for `mkl_ccoomv`.

DOUBLE COMPLEX for `mkl_zcoomv`.

Specifies the scalar *beta*.

y

REAL for `mkl_scoomv`.

DOUBLE PRECISION for `mkl_dcoomv`.

COMPLEX for `mkl_ccoomv`.

DOUBLE COMPLEX for `mkl_zcoomv`.

Array, size at least m if $transa = 'N'$ or $'n'$ and at least k otherwise. On entry, the array y must contain the vector y .

Output Parameters

y Overwritten by the updated vector y .

mkl_?csrsv

Solves a system of linear equations for a sparse matrix in the CSR format.

Syntax

```
call mkl_scsrsv(transa, m, alpha, matdescra, val, indx, pntrb, pntre, x, y)
call mkl_dcsrsv(transa, m, alpha, matdescra, val, indx, pntrb, pntre, x, y)
call mkl_ccsrsv(transa, m, alpha, matdescra, val, indx, pntrb, pntre, x, y)
call mkl_zcsrsv(transa, m, alpha, matdescra, val, indx, pntrb, pntre, x, y)
```

Include Files

- mkl.fi

Description

The mkl_?csrsv routine solves a system of linear equations with matrix-vector operations for a sparse matrix in the CSR format:

```
y := alpha*inv(A)*x
```

or

```
y := alpha*inv(A')*x,
```

where:

alpha is scalar, *x* and *y* are vectors, *A* is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, *A'* is the transpose of *A*.

NOTE

This routine supports a CSR format both with one-based indexing and zero-based indexing.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section "**Interfaces**" below.

<i>transa</i>	CHARACTER*1. Specifies the system of linear equations. If <i>transa</i> = 'N' or 'n', then $y := \alpha \cdot \text{inv}(A) \cdot x$ If <i>transa</i> = 'T' or 't' or 'C' or 'c', then $y := \alpha \cdot \text{inv}(A') \cdot x$,
<i>m</i>	INTEGER. Number of columns of the matrix <i>A</i> .
<i>alpha</i>	REAL for mkl_scsrsv. DOUBLE PRECISION for mkl_dcsrsv. COMPLEX for mkl_ccsrsv. DOUBLE COMPLEX for mkl_zcsrsv. Specifies the scalar <i>alpha</i> .

<i>matdescra</i>	<p>CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table "Possible Values of the Parameter <i>matdescra</i> (<i>descra</i>)". Possible combinations of element values of this parameter are given in Table "Possible Combinations of Element Values of the Parameter <i>matdescra</i>".</p>
<i>val</i>	<p>REAL for mkl_scsrsv. DOUBLE PRECISION for mkl_dcsrsv. COMPLEX for mkl_ccsrsv. DOUBLE COMPLEX for mkl_zcsrsv.</p> <p>Array containing non-zero elements of the matrix A.</p> <p>For one-based indexing its length is $pntre(m) - pntrb(1)$. For zero-based indexing its length is $pntre(m-1) - pntrb(0)$. Refer to <i>values</i> array description in CSR Format for more details.</p> <hr/> <p>NOTE The non-zero elements of the given row of the matrix must be stored in the same order as they appear in the row (from left to right). No diagonal element can be omitted from a sparse storage if the solver is called with the non-unit indicator.</p> <hr/>
<i>indx</i>	<p>INTEGER. Array containing the column indices for each non-zero element of the matrix A.</p> <p>Its length is equal to length of the <i>val</i> array.</p> <p>Refer to <i>columns</i> array description in CSR Format for more details.</p> <hr/> <p>NOTE Column indices must be sorted in increasing order for each row.</p> <hr/>
<i>pntrb</i>	<p>INTEGER. Array of length <i>m</i>.</p> <p>For one-based indexing this array contains row indices, such that $pntrb(i) - pntrb(1) + 1$ is the first index of row <i>i</i> in the arrays <i>val</i> and <i>indx</i>. For zero-based indexing this array contains row indices, such that $pntrb(i) - pntrb(0)$ is the first index of row <i>i</i> in the arrays <i>val</i> and <i>indx</i>.</p> <p>Refer to <i>pointerb</i> array description in CSR Format for more details.</p>
<i>pntre</i>	<p>INTEGER. Array of length <i>m</i>.</p> <p>For one-based indexing this array contains row indices, such that $pntre(i) - pntrb(1)$ is the last index of row <i>i</i> in the arrays <i>val</i> and <i>indx</i>. For zero-based indexing this array contains row indices, such that $pntre(i) - pntrb(0) - 1$ is the last index of row <i>i</i> in the arrays <i>val</i> and <i>indx</i>.</p>

Refer to *pointerE* array description in [CSR Format](#) for more details.

<i>x</i>	<p>REAL for mkl_scsrsv.</p> <p>DOUBLE PRECISION for mkl_dcsrsv.</p> <p>COMPLEX for mkl_ccsrsv.</p> <p>DOUBLE COMPLEX for mkl_zcsrsv.</p> <p>Array, size at least <i>m</i>.</p> <p>On entry, the array <i>x</i> must contain the vector <i>x</i>. The elements are accessed with unit increment.</p>
<i>y</i>	<p>REAL for mkl_scsrsv.</p> <p>DOUBLE PRECISION for mkl_dcsrsv.</p> <p>COMPLEX for mkl_ccsrsv.</p> <p>DOUBLE COMPLEX for mkl_zcsrsv.</p> <p>Array, size at least <i>m</i>.</p> <p>On entry, the array <i>y</i> must contain the vector <i>y</i>. The elements are accessed with unit increment.</p>

Output Parameters

<i>y</i>	Contains solution vector <i>x</i> .

mkl_?bsrsv

Solves a system of linear equations for a sparse matrix in the BSR format.

Syntax

```
call mkl_sbsrsv(transa, m, lb, alpha, matdescra, val, indx, pntbr, pntre, x, y)
```

```
call mkl_dbsrsv(transa, m, lb, alpha, matdescra, val, indx, pntbr, pntre, x, y)
```

```
call mkl_cbsrsv(transa, m, lb, alpha, matdescra, val, indx, pntbr, pntre, x, y)
```

```
call mkl_zbsrsv(transa, m, lb, alpha, matdescra, val, indx, pntbr, pntre, x, y)
```

Include Files

- mkl.fi

Description

The `mkl_?bsrsv` routine solves a system of linear equations with matrix-vector operations for a sparse matrix in the BSR format:

```
y := alpha*inv(A)*x
```

or

```
y := alpha*inv(A')* x,
```

where:

alpha is scalar, *x* and *y* are vectors, *A* is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, *A'* is the transpose of *A*.

NOTE

This routine supports a BSR format both with one-based indexing and zero-based indexing.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section "**Interfaces**" below.

<i>transa</i>	<p>CHARACTER*1. Specifies the operation.</p> <p>If <i>transa</i> = 'N' or 'n', then $y := \alpha * \text{inv}(A) * x$</p> <p>If <i>transa</i> = 'T' or 't' or 'C' or 'c', then $y := \alpha * \text{inv}(A') * x$,</p>
<i>m</i>	INTEGER. Number of block columns of the matrix A.
<i>lb</i>	INTEGER. Size of the block in the matrix A.
<i>alpha</i>	<p>REAL for mkl_sbsrsv.</p> <p>DOUBLE PRECISION for mkl_dbsrsv.</p> <p>COMPLEX for mkl_cbsrsv.</p> <p>DOUBLE COMPLEX for mkl_zbsrsv.</p> <p>Specifies the scalar <i>alpha</i>.</p>
<i>matdescra</i>	<p>CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table "Possible Values of the Parameter <i>matdescra</i> (<i>descra</i>)". Possible combinations of element values of this parameter are given in Table "Possible Combinations of Element Values of the Parameter <i>matdescra</i>".</p>
<i>val</i>	<p>REAL for mkl_sbsrsv.</p> <p>DOUBLE PRECISION for mkl_dbsrsv.</p> <p>COMPLEX for mkl_cbsrsv.</p> <p>DOUBLE COMPLEX for mkl_zbsrsv.</p> <p>Array containing elements of non-zero blocks of the matrix A. Its length is equal to the number of non-zero blocks in the matrix A multiplied by $lb * lb$. Refer to the <i>values</i> array description in BSR Format for more details.</p>
<hr/> <p>NOTE</p> <p>The non-zero elements of the given row of the matrix must be stored in the same order as they appear in the row (from left to right).</p> <p>No diagonal element can be omitted from a sparse storage if the solver is called with the non-unit indicator.</p> <hr/>	
<i>indx</i>	<p>INTEGER. Array containing the column indices for each non-zero block in the matrix A.</p> <p>Its length is equal to the number of non-zero blocks in the matrix A.</p>

Refer to the *columns* array description in [BSR Format](#) for more details.

pntrb

INTEGER. Array of length *m*.

For one-based indexing: this array contains row indices, such that $pntrb(i) - pntrb(1) + 1$ is the first index of block row *i* in the array *indx*.

For zero-based indexing: this array contains row indices, such that $pntrb(i) - pntrb(0)$ is the first index of block row *i* in the array *indx*.

Refer to *pointerB* array description in [BSR Format](#) for more details.

pntrb

INTEGER. Array of length *m*.

For one-based indexing this array contains row indices, such that $pntrb(i) - pntrb(1)$ is the last index of block row *i* in the array *indx*.

For zero-based indexing this array contains row indices, such that $pntrb(i) - pntrb(0) - 1$ is the last index of block row *i* in the array *indx*.

Refer to *pointerE* array description in [BSR Format](#) for more details.

x

REAL for mkl_sbsrsv.

DOUBLE PRECISION for mkl_dbsrsv.

COMPLEX for mkl_cbsrsv.

DOUBLE COMPLEX for mkl_zbsrsv.

Array, size at least $(m \cdot lb)$.

On entry, the array *x* must contain the vector *x*. The elements are accessed with unit increment.

y

REAL for mkl_sbsrsv.

DOUBLE PRECISION for mkl_dbsrsv.

COMPLEX for mkl_cbsrsv.

DOUBLE COMPLEX for mkl_zbsrsv.

Array, size at least $(m \cdot lb)$.

On entry, the array *y* must contain the vector *y*. The elements are accessed with unit increment.

Output Parameters

y

Contains solution vector *x*.

mkl_?csrmm

Computes matrix - matrix product of a sparse matrix stored in the CSR format.

Syntax

```
call mkl_scsrmm(transa, m, n, k, alpha, matdescra, val, indx, pntrb, pntre, b, ldb,
beta, c, ldc)
```

```
call mkl_dcsrmm(transa, m, n, k, alpha, matdescra, val, indx, pntrb, pntre, b, ldb,
beta, c, ldc)
```

```
call mkl_ccsrmm(transa, m, n, k, alpha, matdescra, val, indx, pntrb, pntre, b, ldb,
beta, c, ldc)
```

```
call mkl_zcsrmm(transa, m, n, k, alpha, matdescra, val, indx, pntrb, pntre, b, ldb,
beta, c, ldc)
```

Description

The `mkl_?csrmm` routine performs a matrix-matrix operation defined as

$$C := \alpha A * B + \beta A * C$$

or

$$C := \alpha A' * B + \beta A' * C,$$

where:

alpha and *beta* are scalars,

B and *C* are dense matrices, *A* is an *m*-by-*k* sparse matrix in compressed sparse row (CSR) format, *A'* is the transpose of *A*.

NOTE

This routine supports a CSR format both with one-based indexing and zero-based indexing.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section "**Interfaces**" below.

<i>transa</i>	<p>CHARACTER*1. Specifies the operation.</p> <p>If <i>transa</i> = 'N' or 'n', then $C := \alpha A * B + \beta A * C$</p> <p>If <i>transa</i> = 'T' or 't' or 'C' or 'c', then $C := \alpha A' * B + \beta A' * C,$</p>
<i>m</i>	INTEGER. Number of rows of the matrix <i>A</i> .
<i>n</i>	INTEGER. Number of columns of the matrix <i>C</i> .
<i>k</i>	INTEGER. Number of columns of the matrix <i>A</i> .
<i>alpha</i>	<p>REAL for <code>mkl_scsrmm</code>.</p> <p>DOUBLE PRECISION for <code>mkl_dcsrmm</code>.</p> <p>COMPLEX for <code>mkl_ccsrmm</code>.</p> <p>DOUBLE COMPLEX for <code>mkl_zcsrmm</code>.</p> <p>Specifies the scalar <i>alpha</i>.</p>
<i>matdescra</i>	<p>CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table "Possible Values of the Parameter <i>matdescra</i> (<i>descra</i>)". Possible combinations of element values of this parameter are given in Table "Possible Combinations of Element Values of the Parameter <i>matdescra</i>".</p>
<i>val</i>	<p>REAL for <code>mkl_scsrmm</code>.</p> <p>DOUBLE PRECISION for <code>mkl_dcsrmm</code>.</p>

	<p>COMPLEX for <code>mkl_ccsrmm</code>.</p> <p>DOUBLE COMPLEX for <code>mkl_zcsrmm</code>.</p> <p>Array containing non-zero elements of the matrix <i>A</i>.</p> <p>For one-based indexing its length is $pntrb(m) - pntrb(1)$.</p> <p>For zero-based indexing its length is $pntrb(-1) - pntrb(0)$.</p> <p>Refer to <i>values</i> array description in CSR Format for more details.</p>
<i>indx</i>	<p>INTEGER. Array containing the column indices for each non-zero element of the matrix <i>A</i>.</p> <p>Its length is equal to length of the <i>val</i> array.</p> <p>Refer to <i>columns</i> array description in CSR Format for more details.</p>
<i>pntrb</i>	<p>INTEGER. Array of length <i>m</i>.</p> <p>For one-based indexing this array contains row indices, such that $pntrb(I) - pntrb(1) + 1$ is the first index of row <i>I</i> in the arrays <i>val</i> and <i>indx</i>.</p> <p>For zero-based indexing this array contains row indices, such that $pntrb(I) - pntrb(0)$ is the first index of row <i>I</i> in the arrays <i>val</i> and <i>indx</i>.</p> <p>Refer to <i>pointerb</i> array description in CSR Format for more details.</p>
<i>pntrb</i>	<p>INTEGER. Array of length <i>m</i>.</p> <p>For one-based indexing this array contains row indices, such that $pntrb(I) - pntrb(1)$ is the last index of row <i>I</i> in the arrays <i>val</i> and <i>indx</i>.</p> <p>For zero-based indexing this array contains row indices, such that $pntrb(I) - pntrb(0) - 1$ is the last index of row <i>I</i> in the arrays <i>val</i> and <i>indx</i>.</p> <p>Refer to <i>pointerE</i> array description in CSR Format for more details.</p>
<i>b</i>	<p>REAL for <code>mkl_scsrmm</code>.</p> <p>DOUBLE PRECISION for <code>mkl_dcsrmm</code>.</p> <p>COMPLEX for <code>mkl_ccsrmm</code>.</p> <p>DOUBLE COMPLEX for <code>mkl_zcsrmm</code>.</p> <p>Array, size <i>ldb</i> by at least <i>n</i> for non-transposed matrix <i>A</i> and at least <i>m</i> for transposed for one-based indexing, and (at least <i>k</i> for non-transposed matrix <i>A</i> and at least <i>m</i> for transposed, <i>ldb</i>) for zero-based indexing.</p> <p>On entry with <i>transa</i>='N' or 'n', the leading <i>k</i>-by-<i>n</i> part of the array <i>b</i> must contain the matrix <i>B</i>, otherwise the leading <i>m</i>-by-<i>n</i> part of the array <i>b</i> must contain the matrix <i>B</i>.</p>
<i>ldb</i>	<p>INTEGER. Specifies the leading dimension of <i>b</i> for one-based indexing, and the second dimension of <i>b</i> for zero-based indexing, as declared in the calling (sub)program.</p>
<i>beta</i>	<p>REAL for <code>mkl_scsrmm</code>.</p> <p>DOUBLE PRECISION for <code>mkl_dcsrmm</code>.</p>

COMPLEX for mkl_ccsrm.

DOUBLE COMPLEX for mkl_zcsrm.

Specifies the scalar *beta*.

c REAL for mkl_scsrm.

DOUBLE PRECISION for mkl_dcsrm.

COMPLEX for mkl_ccsrm.

DOUBLE COMPLEX for mkl_zcsrm.

Array, size *ldc* by *n* for one-based indexing, and (*m*, *ldc*) for zero-based indexing.

On entry, the leading *m*-by-*n* part of the array *c* must contain the matrix *C*, otherwise the leading *k*-by-*n* part of the array *c* must contain the matrix *C*.

ldc INTEGER. Specifies the leading dimension of *c* for one-based indexing, and the second dimension of *c* for zero-based indexing, as declared in the calling (sub)program.

Output Parameters

c Overwritten by the matrix ($\alpha * A * B + \beta * C$) or ($\alpha * A' * B + \beta * C$).

mkl_?bsrmm

Computes matrix - matrix product of a sparse matrix stored in the BSR format.

Syntax

```

call mkl_sbsrmm(transa, m, n, k, lb, alpha, matdescra, val, indx, pntrb, pntre, b,
ldb, beta, c, ldc)

call mkl_dbsrmm(transa, m, n, k, lb, alpha, matdescra, val, indx, pntrb, pntre, b,
ldb, beta, c, ldc)

call mkl_cbsrmm(transa, m, n, k, lb, alpha, matdescra, val, indx, pntrb, pntre, b,
ldb, beta, c, ldc)

call mkl_zbsrmm(transa, m, n, k, lb, alpha, matdescra, val, indx, pntrb, pntre, b,
ldb, beta, c, ldc)

```

Include Files

- mkl.fi

Description

The `mkl_?bsrmm` routine performs a matrix-matrix operation defined as

$$C := \alpha A * B + \beta A * C$$

or

$$C := \alpha A * A' * B + \beta A * C,$$

where:

alpha and *beta* are scalars,

B and C are dense matrices, A is an m -by- k sparse matrix in block sparse row (BSR) format, A' is the transpose of A .

NOTE

This routine supports a BSR format both with one-based indexing and zero-based indexing.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

<i>transa</i>	<p>CHARACTER*1. Specifies the operation.</p> <p>If <i>transa</i> = 'N' or 'n', then the matrix-matrix product is computed as $C := \alpha * A * B + \beta * C$</p> <p>If <i>transa</i> = 'T' or 't' or 'C' or 'c', then the matrix-vector product is computed as $C := \alpha * A' * B + \beta * C$,</p>
<i>m</i>	INTEGER. Number of block rows of the matrix A .
<i>n</i>	INTEGER. Number of columns of the matrix C .
<i>k</i>	INTEGER. Number of block columns of the matrix A .
<i>lb</i>	INTEGER. Size of the block in the matrix A .
<i>alpha</i>	<p>REAL for mkl_sbsrmm.</p> <p>DOUBLE PRECISION for mkl_dbsrmm.</p> <p>COMPLEX for mkl_cbsrmm.</p> <p>DOUBLE COMPLEX for mkl_zbsrmm.</p> <p>Specifies the scalar <i>alpha</i>.</p>
<i>matdescra</i>	<p>CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table "Possible Values of the Parameter <i>matdescra</i> (<i>descra</i>)". Possible combinations of element values of this parameter are given in Table "Possible Combinations of Element Values of the Parameter <i>matdescra</i>".</p>
<i>val</i>	<p>REAL for mkl_sbsrmm.</p> <p>DOUBLE PRECISION for mkl_dbsrmm.</p> <p>COMPLEX for mkl_cbsrmm.</p> <p>DOUBLE COMPLEX for mkl_zbsrmm.</p> <p>Array containing elements of non-zero blocks of the matrix A. Its length is equal to the number of non-zero blocks in the matrix A multiplied by $lb * lb$. Refer to the <i>values</i> array description in BSR Format for more details.</p>
<i>indx</i>	INTEGER. Array containing the column indices for each non-zero block in the matrix A .

Its length is equal to the number of non-zero blocks in the matrix A . Refer to the *columns* array description in [BSR Format](#) for more details.

pntrb

INTEGER. Array of length m .

For one-based indexing: this array contains row indices, such that $pntrb(I) - pntrb(1) + 1$ is the first index of block row I in the array *indx*.

For zero-based indexing: this array contains row indices, such that $pntrb(I) - pntrb(0)$ is the first index of block row I in the array *indx*.

Refer to *pointerB* array description in [BSR Format](#) for more details.

pntrb

INTEGER. Array of length m .

For one-based indexing this array contains row indices, such that $pntrb(I) - pntrb(1)$ is the last index of block row I in the array *indx*.

For zero-based indexing this array contains row indices, such that $pntrb(I) - pntrb(0) - 1$ is the last index of block row I in the array *indx*.

Refer to *pointerE* array description in [BSR Format](#) for more details.

b

REAL for mkl_sbsrmm.

DOUBLE PRECISION for mkl_dbsrmm.

COMPLEX for mkl_cbsrmm.

DOUBLE COMPLEX for mkl_zbsrmm.

Array, size *ldb* by at least n for non-transposed matrix A and at least m for transposed for one-based indexing, and (at least k for non-transposed matrix A and at least m for transposed, *ldb*) for zero-based indexing.

On entry with *transa*='N' or 'n', the leading n -by- k block part of the array *b* must contain the matrix B , otherwise the leading m -by- n block part of the array *b* must contain the matrix B .

ldb

INTEGER. Specifies the leading dimension (in blocks) of *b* as declared in the calling (sub)program.

beta

REAL for mkl_sbsrmm.

DOUBLE PRECISION for mkl_dbsrmm.

COMPLEX for mkl_cbsrmm.

DOUBLE COMPLEX for mkl_zbsrmm.

Specifies the scalar *beta*.

c

REAL for mkl_sbsrmm.

DOUBLE PRECISION for mkl_dbsrmm.

COMPLEX for mkl_cbsrmm.

DOUBLE COMPLEX for mkl_zbsrmm.

Array, size (*ldc*, n) for one-based indexing, size (k , *ldc*) for zero-based indexing.

On entry, the leading m -by- n block part of the array c must contain the matrix C , otherwise the leading n -by- k block part of the array c must contain the matrix C .

ldc

INTEGER. Specifies the leading dimension (in blocks) of c as declared in the calling (sub)program.

Output Parameters

c

Overwritten by the matrix $(\alpha * A * B + \beta * C)$ or $(\alpha * A' * B + \beta * C)$.

Description

The `mkl_?cscmm` routine performs a matrix-matrix operation defined as

$$C := \alpha A * B + \beta C$$

or

$$C := \alpha A' * B + \beta C,$$

where:

alpha and *beta* are scalars,

B and *C* are dense matrices, *A* is an *m*-by-*k* sparse matrix in compressed sparse column (CSC) format, *A'* is the transpose of *A*.

NOTE

This routine supports CSC format both with one-based indexing and zero-based indexing.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section "**Interfaces**" below.

<i>transa</i>	<p>CHARACTER*1. Specifies the operation.</p> <p>If <i>transa</i> = 'N' or 'n', then $C := \alpha * A * B + \beta * C$</p> <p>If <i>transa</i> = 'T' or 't' or 'C' or 'c', then $C := \alpha * A' * B + \beta * C$,</p>
<i>m</i>	INTEGER. Number of rows of the matrix <i>A</i> .
<i>n</i>	INTEGER. Number of columns of the matrix <i>C</i> .
<i>k</i>	INTEGER. Number of columns of the matrix <i>A</i> .
<i>alpha</i>	<p>REAL for <code>mkl_scscomm</code>.</p> <p>DOUBLE PRECISION for <code>mkl_dcscmm</code>.</p> <p>COMPLEX for <code>mkl_ccscmm</code>.</p> <p>DOUBLE COMPLEX for <code>mkl_zcscmm</code>.</p> <p>Specifies the scalar <i>alpha</i>.</p>
<i>matdescra</i>	<p>CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table "Possible Values of the Parameter <i>matdescra</i> (<i>descra</i>)". Possible combinations of element values of this parameter are given in Table "Possible Combinations of Element Values of the Parameter <i>matdescra</i>".</p>
<i>val</i>	<p>REAL for <code>mkl_scscomm</code>.</p> <p>DOUBLE PRECISION for <code>mkl_dcscmm</code>.</p> <p>COMPLEX for <code>mkl_ccscmm</code>.</p> <p>DOUBLE COMPLEX for <code>mkl_zcscmm</code>.</p> <p>Array containing non-zero elements of the matrix <i>A</i>.</p> <p>For one-based indexing its length is $pntrb(k) - pntrb(1)$.</p> <p>For zero-based indexing its length is $pntrb(m-1) - pntrb(0)$.</p> <p>Refer to <i>values</i> array description in CSC Format for more details.</p>
<i>indx</i>	<p>INTEGER. Array containing the row indices for each non-zero element of the matrix <i>A</i>.</p> <p>Its length is equal to length of the <i>val</i> array.</p> <p>Refer to <i>rows</i> array description in CSC Format for more details.</p>
<i>pntrb</i>	<p>INTEGER. Array of length <i>k</i>.</p> <p>For one-based indexing this array contains column indices, such that $pntrb(i) - pntrb(1) + 1$ is the first index of column <i>i</i> in the arrays <i>val</i> and <i>indx</i>.</p> <p>For zero-based indexing this array contains column indices, such that $pntrb(i) - pntrb(0)$ is the first index of column <i>i</i> in the arrays <i>val</i> and <i>indx</i>.</p> <p>Refer to <i>pointerb</i> array description in CSC Format for more details.</p>

<i>pntrc</i>	<p>INTEGER. Array of length k.</p> <p>For one-based indexing this array contains column indices, such that $pntrc(i) - pntrb(1)$ is the last index of column i in the arrays <i>val</i> and <i>indx</i>.</p> <p>For zero-based indexing this array contains column indices, such that $pntrc(i) - pntrb(1) - 1$ is the last index of column i in the arrays <i>val</i> and <i>indx</i>.</p> <p>Refer to <i>pointerE</i> array description in CSC Format for more details.</p>
<i>b</i>	<p>REAL for mkl_scscmm.</p> <p>DOUBLE PRECISION for mkl_dcscmm.</p> <p>COMPLEX for mkl_ccscmm.</p> <p>DOUBLE COMPLEX for mkl_zcscmm.</p> <p>Array, size ldb by at least n for non-transposed matrix A and at least m for transposed for one-based indexing, and (at least k for non-transposed matrix A and at least m for transposed, ldb) for zero-based indexing.</p> <p>On entry with <i>transa</i> = 'N' or 'n', the leading k-by-n part of the array b must contain the matrix B, otherwise the leading m-by-n part of the array b must contain the matrix B.</p>
<i>ldb</i>	<p>INTEGER. Specifies the leading dimension of b for one-based indexing, and the second dimension of b for zero-based indexing, as declared in the calling (sub)program.</p>
<i>beta</i>	<p>REAL*8. Specifies the scalar <i>beta</i>.</p>
<i>c</i>	<p>REAL for mkl_scscmm.</p> <p>DOUBLE PRECISION for mkl_dcscmm.</p> <p>COMPLEX for mkl_ccscmm.</p> <p>DOUBLE COMPLEX for mkl_zcscmm.</p> <p>Array, size ldc by n for one-based indexing, and (m, ldc) for zero-based indexing.</p> <p>On entry, the leading m-by-n part of the array c must contain the matrix C, otherwise the leading k-by-n part of the array c must contain the matrix C.</p>
<i>ldc</i>	<p>INTEGER. Specifies the leading dimension of c for one-based indexing, and the second dimension of c for zero-based indexing, as declared in the calling (sub)program.</p>

Output Parameters

<i>c</i>	Overwritten by the matrix $(\alpha * A * B + \beta * C)$ or $(\alpha * A' * B + \beta * C)$.

beta, c, ldc)
```

Include Files

- mkl.fi

Description

The mkl_?coomm routine performs a matrix-matrix operation defined as

$$C := \alpha A * B + \beta C$$

or

$$C := \alpha A' * B + \beta C,$$

where:

α and β are scalars,

B and C are dense matrices, A is an m -by- k sparse matrix in the coordinate format, A' is the transpose of A .

NOTE

This routine supports a coordinate format both with one-based indexing and zero-based indexing.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section "**Interfaces**" below.

<i>transa</i>	CHARACTER*1. Specifies the operation. If <i>transa</i> = 'N' or 'n', then $C := \alpha A * B + \beta C$ If <i>transa</i> = 'T' or 't' or 'C' or 'c', then $C := \alpha A' * B + \beta C$,
<i>m</i>	INTEGER. Number of rows of the matrix A .
<i>n</i>	INTEGER. Number of columns of the matrix C .
<i>k</i>	INTEGER. Number of columns of the matrix A .
<i>alpha</i>	REAL for mkl_scoomm.

	<p>DOUBLE PRECISION for <code>mkl_dcoomm</code>.</p> <p>COMPLEX for <code>mkl_ccoomm</code>.</p> <p>DOUBLE COMPLEX for <code>mkl_zcoomm</code>.</p> <p>Specifies the scalar <i>alpha</i>.</p>
<i>matdescra</i>	<p>CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table "Possible Values of the Parameter <i>matdescra</i> (<i>descra</i>)". Possible combinations of element values of this parameter are given in Table "Possible Combinations of Element Values of the Parameter <i>matdescra</i>".</p>
<i>val</i>	<p>REAL for <code>mkl_scoomm</code>.</p> <p>DOUBLE PRECISION for <code>mkl_dcoomm</code>.</p> <p>COMPLEX for <code>mkl_ccoomm</code>.</p> <p>DOUBLE COMPLEX for <code>mkl_zcoomm</code>.</p> <p>Array of length <i>nnz</i>, contains non-zero elements of the matrix <i>A</i> in the arbitrary order.</p> <p>Refer to <i>values</i> array description in Coordinate Format for more details.</p>
<i>rowind</i>	<p>INTEGER. Array of length <i>nnz</i>, contains the row indices for each non-zero element of the matrix <i>A</i>.</p> <p>Refer to <i>rows</i> array description in Coordinate Format for more details.</p>
<i>colind</i>	<p>INTEGER. Array of length <i>nnz</i>, contains the column indices for each non-zero element of the matrix <i>A</i>.</p> <p>Refer to <i>columns</i> array description in Coordinate Format for more details.</p>
<i>nnz</i>	<p>INTEGER. Specifies the number of non-zero element of the matrix <i>A</i>.</p> <p>Refer to <i>nnz</i> description in Coordinate Format for more details.</p>
<i>b</i>	<p>REAL for <code>mkl_scoomm</code>.</p> <p>DOUBLE PRECISION for <code>mkl_dcoomm</code>.</p> <p>COMPLEX for <code>mkl_ccoomm</code>.</p> <p>DOUBLE COMPLEX for <code>mkl_zcoomm</code>.</p> <p>Array, size <i>ldb</i> by at least <i>n</i> for non-transposed matrix <i>A</i> and at least <i>m</i> for transposed for one-based indexing, and (at least <i>k</i> for non-transposed matrix <i>A</i> and at least <i>m</i> for transposed, <i>ldb</i>) for zero-based indexing.</p> <p>On entry with <i>transa</i> = 'N' or 'n', the leading <i>k</i>-by-<i>n</i> part of the array <i>b</i> must contain the matrix <i>B</i>, otherwise the leading <i>m</i>-by-<i>n</i> part of the array <i>b</i> must contain the matrix <i>B</i>.</p>
<i>ldb</i>	<p>INTEGER. Specifies the leading dimension of <i>b</i> for one-based indexing, and the second dimension of <i>b</i> for zero-based indexing, as declared in the calling (sub)program.</p>
<i>beta</i>	<p>REAL for <code>mkl_scoomm</code>.</p>

	DOUBLE PRECISION for mkl_dcoomm.
	COMPLEX for mkl_ccoomm.
	DOUBLE COMPLEX for mkl_zcoomm.
	Specifies the scalar <i>beta</i> .
<i>c</i>	REAL for mkl_scoomm. DOUBLE PRECISION for mkl_dcoomm. COMPLEX for mkl_ccoomm. DOUBLE COMPLEX for mkl_zcoomm. Array, size <i>ldc</i> by <i>n</i> for one-based indexing, and (<i>m</i> , <i>ldc</i>) for zero-based indexing. On entry, the leading <i>m</i> -by- <i>n</i> part of the array <i>c</i> must contain the matrix <i>C</i> , otherwise the leading <i>k</i> -by- <i>n</i> part of the array <i>c</i> must contain the matrix <i>C</i> .
<i>ldc</i>	INTEGER. Specifies the leading dimension of <i>c</i> for one-based indexing, and the second dimension of <i>c</i> for zero-based indexing, as declared in the calling (sub)program.

Output Parameters

<i>c</i>	Overwritten by the matrix $(\alpha A * B + \beta C)$ or $(\alpha A' * B + \beta C)$.

Description

The mkl_?csrsm routine solves a system of linear equations with matrix-matrix operations for a sparse matrix in the CSR format:

```
C := alpha*inv(A)*B
```

or

```
C := alpha*inv(A')*B,
```

where:

α is scalar, B and C are dense matrices, A is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, A' is the transpose of A .

NOTE

This routine supports a CSR format both with one-based indexing and zero-based indexing.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

<i>transa</i>	<p>CHARACTER*1. Specifies the system of linear equations.</p> <p>If <i>transa</i> = 'N' or 'n', then $C := \alpha \cdot \text{inv}(A) * B$</p> <p>If <i>transa</i> = 'T' or 't' or 'C' or 'c', then $C := \alpha \cdot \text{inv}(A') * B$,</p>
<i>m</i>	INTEGER. Number of columns of the matrix A .
<i>n</i>	INTEGER. Number of columns of the matrix C .
<i>alpha</i>	<p>REAL for mkl_scsrsm.</p> <p>DOUBLE PRECISION for mkl_dcsrsm.</p> <p>COMPLEX for mkl_ccsrsm.</p> <p>DOUBLE COMPLEX for mkl_zcsrsm.</p> <p>Specifies the scalar α.</p>
<i>matdescra</i>	<p>CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table "Possible Values of the Parameter <i>matdescra</i> (<i>descra</i>)". Possible combinations of element values of this parameter are given in Table "Possible Combinations of Element Values of the Parameter <i>matdescra</i>".</p>
<i>val</i>	<p>REAL for mkl_scsrsm.</p> <p>DOUBLE PRECISION for mkl_dcsrsm.</p> <p>COMPLEX for mkl_ccsrsm.</p> <p>DOUBLE COMPLEX for mkl_zcsrsm.</p> <p>Array containing non-zero elements of the matrix A.</p> <p>For one-based indexing its length is $\text{pntrc}(m) - \text{pntrb}(1)$.</p> <p>For zero-based indexing its length is $\text{pntrc}(m-1) - \text{pntrb}(0)$.</p> <p>Refer to <i>values</i> array description in CSR Format for more details.</p>

NOTE

The non-zero elements of the given row of the matrix must be stored in the same order as they appear in the row (from left to right).

No diagonal element can be omitted from a sparse storage if the solver is called with the non-unit indicator.

indx

INTEGER. Array containing the column indices for each non-zero element of the matrix *A*.

Its length is equal to length of the *val* array.

Refer to *columns* array description in [CSR Format](#) for more details.

NOTE

Column indices must be sorted in increasing order for each row.

pntrb

INTEGER. Array of length *m*.

For one-based indexing this array contains row indices, such that *pntrb(i) - pntrb(1) + 1* is the first index of row *i* in the arrays *val* and *indx*.

For zero-based indexing this array contains row indices, such that *pntrb(i) - pntrb(0)* is the first index of row *i* in the arrays *val* and *indx*.

Refer to *pointerb* array description in [CSR Format](#) for more details.

pntrE

INTEGER. Array of length *m*.

For one-based indexing this array contains row indices, such that *pntrE(i) - pntrb(1)* is the last index of row *i* in the arrays *val* and *indx*.

For zero-based indexing this array contains row indices, such that *pntrE(i) - pntrb(0) - 1* is the last index of row *i* in the arrays *val* and *indx*.

Refer to *pointerE* array description in [CSR Format](#) for more details.

b

REAL for *mkl_scsrsm*.

DOUBLE PRECISION for *mkl_dcsrsm*.

COMPLEX for *mkl_ccsrsm*.

DOUBLE COMPLEX for *mkl_zcsrsm*.

Array, size (*ldb*, *n*) for one-based indexing, and (*m*, *ldb*) for zero-based indexing.

On entry the leading *m*-by-*n* part of the array *b* must contain the matrix *B*.

ldb

INTEGER. Specifies the leading dimension of *b* for one-based indexing, and the second dimension of *b* for zero-based indexing, as declared in the calling (sub)program.

ldc

INTEGER. Specifies the leading dimension of *c* for one-based indexing, and the second dimension of *c* for zero-based indexing, as declared in the calling (sub)program.

Output Parameters

`c` REAL*8.
 Array, size `ldc` by `n` for one-based indexing, and `(m, ldc)` for zero-based indexing.
 The leading `m-by-n` part of the array `c` contains the output matrix `C`.

Description

The `mkl_?cscsm` routine solves a system of linear equations with matrix-matrix operations for a sparse matrix in the CSC format:

```
C := alpha*inv(A)*B
```

or

```
C := alpha*inv(A')*B,
```

where:

alpha is scalar, *B* and *C* are dense matrices, *A* is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, *A'* is the transpose of *A*.

NOTE

This routine supports a CSC format both with one-based indexing and zero-based indexing.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section "**Interfaces**" below.

<i>transa</i>	<p>CHARACTER*1. Specifies the system of equations.</p> <p>If <i>transa</i> = 'N' or 'n', then $C := \alpha * \text{inv}(A) * B$</p> <p>If <i>transa</i> = 'T' or 't' or 'C' or 'c', then $C := \alpha * \text{inv}(A') * B$,</p>
<i>m</i>	INTEGER. Number of columns of the matrix <i>A</i> .
<i>n</i>	INTEGER. Number of columns of the matrix <i>C</i> .
<i>alpha</i>	<p>REAL for mkl_scscsm.</p> <p>DOUBLE PRECISION for mkl_dcscsm.</p> <p>COMPLEX for mkl_ccscsm.</p> <p>DOUBLE COMPLEX for mkl_zcscsm.</p> <p>Specifies the scalar <i>alpha</i>.</p>
<i>matdescra</i>	<p>CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table "Possible Values of the Parameter <i>matdescra</i> (<i>descra</i>)". Possible combinations of element values of this parameter are given in Table "Possible Combinations of Element Values of the Parameter <i>matdescra</i>".</p>
<i>val</i>	<p>REAL for mkl_scscsm.</p> <p>DOUBLE PRECISION for mkl_dcscsm.</p> <p>COMPLEX for mkl_ccscsm.</p> <p>DOUBLE COMPLEX for mkl_zcscsm.</p> <p>Array containing non-zero elements of the matrix <i>A</i>.</p> <p>For one-based indexing its length is $\text{pntre}(k) - \text{pntrb}(1)$.</p> <p>For zero-based indexing its length is $\text{pntre}(m-1) - \text{pntrb}(0)$.</p> <p>Refer to <i>values</i> array description in CSC Format for more details.</p> <hr/> <p>NOTE</p> <p>The non-zero elements of the given row of the matrix must be stored in the same order as they appear in the row (from left to right).</p> <p>No diagonal element can be omitted from a sparse storage if the solver is called with the non-unit indicator.</p> <hr/>
<i>indx</i>	<p>INTEGER. Array containing the row indices for each non-zero element of the matrix <i>A</i>. Its length is equal to length of the <i>val</i> array.</p> <p>Refer to <i>rows</i> array description in CSC Format for more details.</p> <hr/> <p>NOTE</p> <p>Row indices must be sorted in increasing order for each column.</p> <hr/>
<i>pntrb</i>	INTEGER. Array of length <i>m</i> .

For one-based indexing this array contains column indices, such that $pntreb(I) - pntreb(1) + 1$ is the first index of column I in the arrays *val* and *indx*.

For zero-based indexing this array contains column indices, such that $pntreb(I) - pntreb(0)$ is the first index of column I in the arrays *val* and *indx*.

Refer to *pointerb* array description in [CSC Format](#) for more details.

pntre

INTEGER. Array of length m .

For one-based indexing this array contains column indices, such that $pntre(I) - pntreb(1)$ is the last index of column I in the arrays *val* and *indx*.

For zero-based indexing this array contains column indices, such that $pntre(I) - pntreb(1) - 1$ is the last index of column I in the arrays *val* and *indx*.

Refer to *pointerE* array description in [CSC Format](#) for more details.

b

REAL for mkl_scscsm.

DOUBLE PRECISION for mkl_dcscsm.

COMPLEX for mkl_ccscsm.

DOUBLE COMPLEX for mkl_zcscsm.

Array, size ldb by n for one-based indexing, and (m, ldb) for zero-based indexing.

On entry the leading m -by- n part of the array *b* must contain the matrix B .

ldb

INTEGER. Specifies the leading dimension of *b* for one-based indexing, and the second dimension of *b* for zero-based indexing, as declared in the calling (sub)program.

ldc

INTEGER. Specifies the leading dimension of *c* for one-based indexing, and the second dimension of *c* for zero-based indexing, as declared in the calling (sub)program.

Output Parameters

c

REAL for mkl_scscsm.

DOUBLE PRECISION for mkl_dcscsm.

COMPLEX for mkl_ccscsm.

DOUBLE COMPLEX for mkl_zcscsm.

Array, size ldc by n for one-based indexing, and (m, ldc) for zero-based indexing.

The leading m -by- n part of the array *c* contains the output matrix C .

mkl_?coosm

Solves a system of linear matrix equations for a sparse matrix in the coordinate format.

Syntax

```
call mkl_scoosm(transa, m, n, alpha, matdescra, val, rowind, colind, nnz, b, ldb, c,
ldb)
call mkl_dcoosm(transa, m, n, alpha, matdescra, val, rowind, colind, nnz, b, ldb, c,
ldb)
call mkl_ccoosm(transa, m, n, alpha, matdescra, val, rowind, colind, nnz, b, ldb, c,
ldb)
call mkl_zcoosm(transa, m, n, alpha, matdescra, val, rowind, colind, nnz, b, ldb, c,
ldb)
```

Include Files

- mkl.fi

Description

The `mkl_?coosm` routine solves a system of linear equations with matrix-matrix operations for a sparse matrix in the coordinate format:

```
C := alpha*inv(A)*B
```

or

```
C := alpha*inv(A')*B,
```

where:

alpha is scalar, *B* and *C* are dense matrices, *A* is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, *A'* is the transpose of *A*.

NOTE

This routine supports a coordinate format both with one-based indexing and zero-based indexing.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section "**Interfaces**" below.

<i>transa</i>	CHARACTER*1. Specifies the system of linear equations. If <i>transa</i> = 'N' or 'n', then the matrix-matrix product is computed as $C := \alpha \cdot \text{inv}(A) \cdot B$ If <i>transa</i> = 'T' or 't' or 'C' or 'c', then the matrix-vector product is computed as $C := \alpha \cdot \text{inv}(A') \cdot B$,
<i>m</i>	INTEGER. Number of rows of the matrix <i>A</i> .
<i>n</i>	INTEGER. Number of columns of the matrix <i>C</i> .
<i>alpha</i>	REAL for <code>mkl_scoosm</code> .

	DOUBLE PRECISION for <code>mkl_dcoosm</code> .
	COMPLEX for <code>mkl_ccoosm</code> .
	DOUBLE COMPLEX for <code>mkl_zcoosm</code> .
	Specifies the scalar <i>alpha</i> .
<i>matdescra</i>	<p>CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table "Possible Values of the Parameter <i>matdescra</i> (<i>descra</i>)". Possible combinations of element values of this parameter are given in Table "Possible Combinations of Element Values of the Parameter <i>matdescra</i>".</p>
<i>val</i>	<p>REAL for <code>mkl_scoosm</code>.</p> <p>DOUBLE PRECISION for <code>mkl_dcoosm</code>.</p> <p>COMPLEX for <code>mkl_ccoosm</code>.</p> <p>DOUBLE COMPLEX for <code>mkl_zcoosm</code>.</p> <p>Array of length <i>nnz</i>, contains non-zero elements of the matrix <i>A</i> in the arbitrary order.</p> <p>Refer to <i>values</i> array description in Coordinate Format for more details.</p>
<i>rowind</i>	<p>INTEGER. Array of length <i>nnz</i>, contains the row indices for each non-zero element of the matrix <i>A</i>.</p> <p>Refer to <i>rows</i> array description in Coordinate Format for more details.</p>
<i>colind</i>	<p>INTEGER. Array of length <i>nnz</i>, contains the column indices for each non-zero element of the matrix <i>A</i>.</p> <p>Refer to <i>columns</i> array description in Coordinate Format for more details.</p>
<i>nnz</i>	<p>INTEGER. Specifies the number of non-zero element of the matrix <i>A</i>.</p> <p>Refer to <i>nnz</i> description in Coordinate Format for more details.</p>
<i>b</i>	<p>REAL for <code>mkl_scoosm</code>.</p> <p>DOUBLE PRECISION for <code>mkl_dcoosm</code>.</p> <p>COMPLEX for <code>mkl_ccoosm</code>.</p> <p>DOUBLE COMPLEX for <code>mkl_zcoosm</code>.</p> <p>Array, size <i>ldb</i> by <i>n</i> for one-based indexing, and (m, \textit{ldb}) for zero-based indexing.</p> <p>Before entry the leading <i>m</i>-by-<i>n</i> part of the array <i>b</i> must contain the matrix <i>B</i>.</p>
<i>ldb</i>	<p>INTEGER. Specifies the leading dimension of <i>b</i> for one-based indexing, and the second dimension of <i>b</i> for zero-based indexing, as declared in the calling (sub)program.</p>
<i>ldc</i>	<p>INTEGER. Specifies the leading dimension of <i>c</i> for one-based indexing, and the second dimension of <i>c</i> for zero-based indexing, as declared in the calling (sub)program.</p>

Output Parameters

c REAL for mkl_scoosm.
 DOUBLE PRECISION for mkl_dcoosm.
 COMPLEX for mkl_ccoosm.
 DOUBLE COMPLEX for mkl_zcoosm.
 Array, size *ldc* by *n* for one-based indexing, and (*m*, *ldc*) for zero-based indexing.
 The leading *m*-by-*n* part of the array *c* contains the output matrix *C*.

mkl_?bsrsm

Solves a system of linear matrix equations for a sparse matrix in the BSR format.

Syntax

```
call mkl_scsrsm(transa, m, n, lb, alpha, matdescra, val, indx, pntbr, pntre, b, ldb, c, ldc)
```

```
call mkl_dcsrsm(transa, m, n, lb, alpha, matdescra, val, indx, pntbr, pntre, b, ldb, c, ldc)
```

```
call mkl_ccsrsm(transa, m, n, lb, alpha, matdescra, val, indx, pntbr, pntre, b, ldb, c, ldc)
```

```
call mkl_zcsrsm(transa, m, n, lb, alpha, matdescra, val, indx, pntbr, pntre, b, ldb, c, ldc)
```

Include Files

- mkl.fi

Description

The `mkl_?bsrsm` routine solves a system of linear equations with matrix-matrix operations for a sparse matrix in the BSR format:

```
C := alpha*inv(A)*B
```

or

```
C := alpha*inv(A')*B,
```

where:

alpha is scalar, *B* and *C* are dense matrices, *A* is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, *A'* is the transpose of *A*.

NOTE

This routine supports a BSR format both with one-based indexing and zero-based indexing.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section "**Interfaces**" below.

<i>transa</i>	<p>CHARACTER*1. Specifies the operation.</p> <p>If <i>transa</i> = 'N' or 'n', then the matrix-matrix product is computed as $C := \alpha * \text{inv}(A) * B$.</p> <p>If <i>transa</i> = 'T' or 't' or 'C' or 'c', then the matrix-vector product is computed as $C := \alpha * \text{inv}(A') * B$.</p>
<i>m</i>	INTEGER. Number of block columns of the matrix A.
<i>n</i>	INTEGER. Number of columns of the matrix C.
<i>lb</i>	INTEGER. Size of the block in the matrix A.
<i>alpha</i>	<p>REAL for mkl_sbsrsm.</p> <p>DOUBLE PRECISION for mkl_dbsrsm.</p> <p>COMPLEX for mkl_cbsrsm.</p> <p>DOUBLE COMPLEX for mkl_zbsrsm.</p> <p>Specifies the scalar <i>alpha</i>.</p>
<i>matdescra</i>	<p>CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table "Possible Values of the Parameter <i>matdescra</i> (<i>descra</i>)". Possible combinations of element values of this parameter are given in Table "Possible Combinations of Element Values of the Parameter <i>matdescra</i>".</p>
<i>val</i>	<p>REAL for mkl_sbsrsm.</p> <p>DOUBLE PRECISION for mkl_dbsrsm.</p> <p>COMPLEX for mkl_cbsrsm.</p> <p>DOUBLE COMPLEX for mkl_zbsrsm.</p> <p>Array containing elements of non-zero blocks of the matrix A. Its length is equal to the number of non-zero blocks in the matrix A multiplied by $lb * lb$. Refer to the <i>values</i> array description in BSR Format for more details.</p>
<hr/> <p>NOTE</p> <p>The non-zero elements of the given row of the matrix must be stored in the same order as they appear in the row (from left to right).</p> <p>No diagonal element can be omitted from a sparse storage if the solver is called with the non-unit indicator.</p> <hr/>	
<i>indx</i>	<p>INTEGER. Array containing the column indices for each non-zero element of the matrix A.</p> <p>Its length is equal to the number of non-zero blocks in the matrix A.</p> <p>Refer to the <i>columns</i> array description in BSR Format for more details.</p>
<i>pntrb</i>	INTEGER. Array of length <i>m</i> .

For one-based indexing: this array contains row indices, such that $\text{pntrb}(i) - \text{pntrb}(1) + 1$ is the first index of block row i in the array indx .

For zero-based indexing: this array contains row indices, such that $\text{pntrb}(i) - \text{pntrb}(0)$ is the first index of block row i in the array indx .

Refer to *pointerB* array description in [BSR Format](#) for more details.

pntrc

INTEGER. Array of length m .

For one-based indexing this array contains row indices, such that $\text{pntrc}(i) - \text{pntrb}(1)$ is the last index of block row i in the array indx .

For zero-based indexing this array contains row indices, such that $\text{pntrc}(i) - \text{pntrb}(0) - 1$ is the last index of block row i in the array indx .

Refer to *pointerE* array description in [BSR Format](#) for more details.

b

REAL for `mkl_sbsrsm`.

DOUBLE PRECISION for `mkl_dbsrsm`.

COMPLEX for `mkl_cbsrsm`.

DOUBLE COMPLEX for `mkl_zbsrsm`.

Array, size (ldb, n) for one-based indexing, size (m, ldb) for zero-based indexing.

On entry the leading m -by- n part of the array b must contain the matrix B .

ldb

INTEGER. Specifies the leading dimension (in blocks) of b as declared in the calling (sub)program.

ldc

INTEGER. Specifies the leading dimension (in blocks) of c as declared in the calling (sub)program.

Output Parameters

c

REAL for `mkl_sbsrsm`.

DOUBLE PRECISION for `mkl_dbsrsm`.

COMPLEX for `mkl_cbsrsm`.

DOUBLE COMPLEX for `mkl_zbsrsm`.

Array, size (ldc, n) for one-based indexing, size (m, ldc) for zero-based indexing.

The leading m -by- n part of the array c contains the output matrix C .

mkl_?diamv

Computes matrix - vector product for a sparse matrix in the diagonal format with one-based indexing.

Syntax

```
call mkl_sdiamv(transa, m, k, alpha, matdescra, val, lval, iddiag, ndiag, x, beta, y)
```

```
call mkl_ddiamv(transa, m, k, alpha, matdescra, val, lval, idiag, ndiag, x, beta, y)
call mkl_cdiamv(transa, m, k, alpha, matdescra, val, lval, idiag, ndiag, x, beta, y)
call mkl_zdiamv(transa, m, k, alpha, matdescra, val, lval, idiag, ndiag, x, beta, y)
```

Include Files

- mkl.fi

Description

The `mkl_?diamv` routine performs a matrix-vector operation defined as

$$y := \alpha A x + \beta y$$

or

$$y := \alpha A' x + \beta y,$$

where:

α and β are scalars,

x and y are vectors,

A is an m -by- k sparse matrix stored in the diagonal format, A' is the transpose of A .

NOTE

This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section "**Interfaces**" below.

<i>transa</i>	<p>CHARACTER*1. Specifies the operation.</p> <p>If <i>transa</i> = 'N' or 'n', then $y := \alpha A x + \beta y$,</p> <p>If <i>transa</i> = 'T' or 't' or 'C' or 'c', then $y := \alpha A' x + \beta y$.</p>
<i>m</i>	INTEGER. Number of rows of the matrix A .
<i>k</i>	INTEGER. Number of columns of the matrix A .
<i>alpha</i>	<p>REAL for <code>mkl_sdiamv</code>.</p> <p>DOUBLE PRECISION for <code>mkl_ddiamv</code>.</p> <p>COMPLEX for <code>mkl_cdiamv</code>.</p> <p>DOUBLE COMPLEX for <code>mkl_zdiamv</code>.</p> <p>Specifies the scalar α.</p>
<i>matdescra</i>	<p>CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table "Possible Values of the Parameter <i>matdescra</i> (<i>descra</i>)". Possible combinations of element values of this parameter are given in Table "Possible Combinations of Element Values of the Parameter <i>matdescra</i>".</p>

<i>val</i>	<p>REAL for mkl_sdiamv.</p> <p>DOUBLE PRECISION for mkl_ddiamv.</p> <p>COMPLEX for mkl_cdiamv.</p> <p>DOUBLE COMPLEX for mkl_zdiamv.</p> <p>Two-dimensional array of size <i>lval</i> by <i>ndiag</i>, contains non-zero diagonals of the matrix <i>A</i>. Refer to <i>values</i> array description in Diagonal Storage Scheme for more details.</p>
<i>lval</i>	<p>INTEGER. Leading dimension of <i>val</i>, $lval \geq m$. Refer to <i>lval</i> description in Diagonal Storage Scheme for more details.</p>
<i>idiag</i>	<p>INTEGER. Array of length <i>ndiag</i>, contains the distances between main diagonal and each non-zero diagonals in the matrix <i>A</i>.</p> <p>Refer to <i>distance</i> array description in Diagonal Storage Scheme for more details.</p>
<i>ndiag</i>	<p>INTEGER. Specifies the number of non-zero diagonals of the matrix <i>A</i>.</p>
<i>x</i>	<p>REAL for mkl_sdiamv.</p> <p>DOUBLE PRECISION for mkl_ddiamv.</p> <p>COMPLEX for mkl_cdiamv.</p> <p>DOUBLE COMPLEX for mkl_zdiamv.</p> <p>Array, size at least <i>k</i> if <i>transa</i> = 'N' or 'n', and at least <i>m</i> otherwise. On entry, the array <i>x</i> must contain the vector <i>x</i>.</p>
<i>beta</i>	<p>REAL for mkl_sdiamv.</p> <p>DOUBLE PRECISION for mkl_ddiamv.</p> <p>COMPLEX for mkl_cdiamv.</p> <p>DOUBLE COMPLEX for mkl_zdiamv.</p> <p>Specifies the scalar <i>beta</i>.</p>
<i>y</i>	<p>REAL for mkl_sdiamv.</p> <p>DOUBLE PRECISION for mkl_ddiamv.</p> <p>COMPLEX for mkl_cdiamv.</p> <p>DOUBLE COMPLEX for mkl_zdiamv.</p> <p>Array, size at least <i>m</i> if <i>transa</i> = 'N' or 'n', and at least <i>k</i> otherwise. On entry, the array <i>y</i> must contain the vector <i>y</i>.</p>

Output Parameters

<i>y</i>	Overwritten by the updated vector <i>y</i> .

mkl_?skymv

Computes matrix - vector product for a sparse matrix in the skyline storage format with one-based indexing.

Syntax

```
call mkl_sskymv(transa, m, k, alpha, matdescra, val, pntr, x, beta, y)
call mkl_dskymv(transa, m, k, alpha, matdescra, val, pntr, x, beta, y)
call mkl_cskymv(transa, m, k, alpha, matdescra, val, pntr, x, beta, y)
call mkl_zskymv(transa, m, k, alpha, matdescra, val, pntr, x, beta, y)
```

Include Files

- mkl.fi

Description

The mkl_?skymv routine performs a matrix-vector operation defined as

```
y := alpha*A*x + beta*y
```

or

```
y := alpha*A'*x + beta*y,
```

where:

alpha and *beta* are scalars,

x and *y* are vectors,

A is an *m*-by-*k* sparse matrix stored using the skyline storage scheme, *A'* is the transpose of *A*.

NOTE

This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section "**Interfaces**" below.

<i>transa</i>	CHARACTER*1. Specifies the operation. If <i>transa</i> = 'N' or 'n', then $y := \alpha A x + \beta y$ If <i>transa</i> = 'T' or 't' or 'C' or 'c', then $y := \alpha A' x + \beta y$,
<i>m</i>	INTEGER. Number of rows of the matrix <i>A</i> .
<i>k</i>	INTEGER. Number of columns of the matrix <i>A</i> .
<i>alpha</i>	REAL for mkl_sskymv. DOUBLE PRECISION for mkl_dskymv. COMPLEX for mkl_cskymv. DOUBLE COMPLEX for mkl_zskymv.

Specifies the scalar *alpha*.

matdescra

CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in [Table "Possible Values of the Parameter *matdescra* \(*descra*\)"](#). Possible combinations of element values of this parameter are given in [Table "Possible Combinations of Element Values of the Parameter *matdescra*"](#).

NOTE

General matrices (*matdescra*(1)='G') is not supported.

val

REAL for *mkl_sskymv*.

DOUBLE PRECISION for *mkl_dskymv*.

COMPLEX for *mkl_cskymv*.

DOUBLE COMPLEX for *mkl_zskymv*.

Array containing the set of elements of the matrix *A* in the skyline profile form.

If *matdescrsa*(2) = 'L', then *val* contains elements from the low triangle of the matrix *A*.

If *matdescrsa*(2) = 'U', then *val* contains elements from the upper triangle of the matrix *A*.

Refer to *values* array description in [Skyline Storage Scheme](#) for more details.

pntr

INTEGER. Array of length $(m + 1)$ for lower triangle, and $(k + 1)$ for upper triangle.

It contains the indices specifying in the *val* the positions of the first element in each row (column) of the matrix *A*. Refer to *pointers* array description in [Skyline Storage Scheme](#) for more details.

x

REAL for *mkl_sskymv*.

DOUBLE PRECISION for *mkl_dskymv*.

COMPLEX for *mkl_cskymv*.

DOUBLE COMPLEX for *mkl_zskymv*.

Array, size at least *k* if *transa* = 'N' or 'n' and at least *m* otherwise. On entry, the array *x* must contain the vector *x*.

beta

REAL for *mkl_sskymv*.

DOUBLE PRECISION for *mkl_dskymv*.

COMPLEX for *mkl_cskymv*.

DOUBLE COMPLEX for *mkl_zskymv*.

Specifies the scalar *beta*.

y

REAL for *mkl_sskymv*.

DOUBLE PRECISION for mkl_dskymv.

COMPLEX for mkl_cskymv.

DOUBLE COMPLEX for mkl_zskymv.

Array, size at least m if *transa* = 'N' or 'n' and at least k otherwise. On entry, the array *y* must contain the vector *y*.

Output Parameters

y Overwritten by the updated vector *y*.

mkl_?diasv

Solves a system of linear equations for a sparse matrix in the diagonal format with one-based indexing.

Syntax

```
call mkl_sdiasv(transa, m, alpha, matdescra, val, lval, idiag, ndiag, x, y)
```

```
call mkl_ddiasv(transa, m, alpha, matdescra, val, lval, idiag, ndiag, x, y)
```

```
call mkl_cdiasv(transa, m, alpha, matdescra, val, lval, idiag, ndiag, x, y)
```

```
call mkl_zdiasv(transa, m, alpha, matdescra, val, lval, idiag, ndiag, x, y)
```

Include Files

- mkl.fi

Description

The `mkl_?diasv` routine solves a system of linear equations with matrix-vector operations for a sparse matrix stored in the diagonal format:

```
y := alpha*inv(A)*x
```

or

```
y := alpha*inv(A')* x,
```

where:

alpha is scalar, *x* and *y* are vectors, *A* is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, *A'* is the transpose of *A*.

NOTE

This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section "**Interfaces**" below.

transa CHARACTER*1. Specifies the system of linear equations.

If *transa* = 'N' or 'n', then $y := \alpha \cdot \text{inv}(A) \cdot x$

	If <i>transa</i> = 'T' or 't' or 'C' or 'c', then $y := \alpha * \text{inv}(A') * x$,
<i>m</i>	INTEGER. Number of rows of the matrix <i>A</i> .
<i>alpha</i>	REAL for mkl_sdiasv. DOUBLE PRECISION for mkl_ddiasv. COMPLEX for mkl_cdiasv. DOUBLE COMPLEX for mkl_zdiasv. Specifies the scalar <i>alpha</i> .
<i>matdescra</i>	CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table "Possible Values of the Parameter <i>matdescra</i> (<i>descra</i>)" . Possible combinations of element values of this parameter are given in Table "Possible Combinations of Element Values of the Parameter <i>matdescra</i>" .
<i>val</i>	REAL for mkl_sdiasv. DOUBLE PRECISION for mkl_ddiasv. COMPLEX for mkl_cdiasv. DOUBLE COMPLEX for mkl_zdiasv. Two-dimensional array of size <i>lval</i> by <i>ndiag</i> , contains non-zero diagonals of the matrix <i>A</i> . Refer to <i>values</i> array description in Diagonal Storage Scheme for more details.
<i>lval</i>	INTEGER. Leading dimension of <i>val</i> , $lval \geq m$. Refer to <i>lval</i> description in Diagonal Storage Scheme for more details.
<i>idiag</i>	INTEGER. Array of length <i>ndiag</i> , contains the distances between main diagonal and each non-zero diagonals in the matrix <i>A</i> .

NOTE

All elements of this array must be sorted in increasing order.

Refer to *distance* array description in [Diagonal Storage Scheme](#) for more details.

<i>ndiag</i>	INTEGER. Specifies the number of non-zero diagonals of the matrix <i>A</i> .
<i>x</i>	REAL for mkl_sdiasv. DOUBLE PRECISION for mkl_ddiasv. COMPLEX for mkl_cdiasv. DOUBLE COMPLEX for mkl_zdiasv. Array, size at least <i>m</i> . On entry, the array <i>x</i> must contain the vector <i>x</i> . The elements are accessed with unit increment.

y REAL for mkl_sdiasv.
 DOUBLE PRECISION for mkl_ddiasv.
 COMPLEX for mkl_cdiasv.
 DOUBLE COMPLEX for mkl_zdiasv.
 Array, size at least m .
 On entry, the array y must contain the vector y . The elements are accessed with unit increment.

Output Parameters

y Contains solution vector x .

- mkl.fi

Description

The `mkl_?skysv` routine solves a system of linear equations with matrix-vector operations for a sparse matrix in the skyline storage format:

```
y := alpha*inv(A)*x
```

or

```
y := alpha*inv(A')*x,
```

where:

alpha is scalar, *x* and *y* are vectors, *A* is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, *A'* is the transpose of *A*.

NOTE

This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section "**Interfaces**" below.

transa CHARACTER*1. Specifies the system of linear equations.

If *transa* = 'N' or 'n', then $y := \alpha \cdot \text{inv}(A) \cdot x$

If *transa* = 'T' or 't' or 'C' or 'c', then $y := \alpha \cdot \text{inv}(A') \cdot x$,

<i>m</i>	INTEGER. Number of rows of the matrix <i>A</i> .
<i>alpha</i>	<p>REAL for mkl_sskysv.</p> <p>DOUBLE PRECISION for mkl_dskysv.</p> <p>COMPLEX for mkl_cskysv.</p> <p>DOUBLE COMPLEX for mkl_zskysv.</p> <p>Specifies the scalar <i>alpha</i>.</p>
<i>matdescra</i>	<p>CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table "Possible Values of the Parameter <i>matdescra</i> (<i>descra</i>)". Possible combinations of element values of this parameter are given in Table "Possible Combinations of Element Values of the Parameter <i>matdescra</i>".</p> <hr/> <p>NOTE General matrices (<i>matdescra</i>(1)='G') is not supported.</p> <hr/>
<i>val</i>	<p>REAL for mkl_sskysv.</p> <p>DOUBLE PRECISION for mkl_dskysv.</p> <p>COMPLEX for mkl_cskysv.</p> <p>DOUBLE COMPLEX for mkl_zskysv.</p> <p>Array containing the set of elements of the matrix <i>A</i> in the skyline profile form.</p> <p>If <i>matdescra</i>(2) = 'L', then <i>val</i> contains elements from the low triangle of the matrix <i>A</i>.</p> <p>If <i>matdescra</i>(2) = 'U', then <i>val</i> contains elements from the upper triangle of the matrix <i>A</i>.</p> <p>Refer to <i>values</i> array description in Skyline Storage Scheme for more details.</p>
<i>pntr</i>	<p>INTEGER. Array of length (<i>m</i> + 1) for lower triangle, and (<i>k</i> + 1) for upper triangle.</p> <p>It contains the indices specifying in the <i>val</i> the positions of the first element in each row (column) of the matrix <i>A</i>. Refer to <i>pointers</i> array description in Skyline Storage Scheme for more details.</p>
<i>x</i>	<p>REAL for mkl_sskysv.</p> <p>DOUBLE PRECISION for mkl_dskysv.</p> <p>COMPLEX for mkl_cskysv.</p> <p>DOUBLE COMPLEX for mkl_zskysv.</p> <p>Array, size at least <i>m</i>.</p> <p>On entry, the array <i>x</i> must contain the vector <i>x</i>. The elements are accessed with unit increment.</p>

y REAL for mkl_sskysv.
 DOUBLE PRECISION for mkl_dskysv.
 COMPLEX for mkl_cskysv.
 DOUBLE COMPLEX for mkl_zskysv.
 Array, size at least m .
 On entry, the array y must contain the vector y . The elements are accessed with unit increment.

Output Parameters

y Contains solution vector x .

mkl_?diamm

Computes matrix-matrix product of a sparse matrix stored in the diagonal format with one-based indexing.

Syntax

```
call mkl_sdiamm(transa, m, n, k, alpha, matdescra, val, lval, idiag, ndiag, b, ldb, beta, c, ldc)
```

```
call mkl_ddiamm(transa, m, n, k, alpha, matdescra, val, lval, idiag, ndiag, b, ldb, beta, c, ldc)
```

```
call mkl_cdiamm(transa, m, n, k, alpha, matdescra, val, lval, idiag, ndiag, b, ldb, beta, c, ldc)
```

```
call mkl_zdiamm(transa, m, n, k, alpha, matdescra, val, lval, idiag, ndiag, b, ldb, beta, c, ldc)
```

Include Files

- mkl.fi

Description

The `mkl_?diamm` routine performs a matrix-matrix operation defined as

```
 $C := \alpha A * B + \beta C$ 
```

or

```
 $C := \alpha A' * B + \beta C,$ 
```

where:

alpha and *beta* are scalars,

B and *C* are dense matrices, *A* is an *m*-by-*k* sparse matrix in the diagonal format, *A'* is the transpose of *A*.

NOTE

This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section "**Interfaces**" below.

<i>transa</i>	<p>CHARACTER*1. Specifies the operation.</p> <p>If <i>transa</i> = 'N' or 'n', then $C := \alpha * A * B + \beta * C$,</p> <p>If <i>transa</i> = 'T' or 't' or 'C' or 'c', then $C := \alpha * A' * B + \beta * C$.</p>
<i>m</i>	INTEGER. Number of rows of the matrix <i>A</i> .
<i>n</i>	INTEGER. Number of columns of the matrix <i>C</i> .
<i>k</i>	INTEGER. Number of columns of the matrix <i>A</i> .
<i>alpha</i>	<p>REAL for mkl_sdiamm.</p> <p>DOUBLE PRECISION for mkl_ddiamm.</p> <p>COMPLEX for mkl_cdiamm.</p> <p>DOUBLE COMPLEX for mkl_zdiamm.</p> <p>Specifies the scalar <i>alpha</i>.</p>
<i>matdescra</i>	<p>CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table "Possible Values of the Parameter <i>matdescra</i> (<i>descra</i>)". Possible combinations of element values of this parameter are given in Table "Possible Combinations of Element Values of the Parameter <i>matdescra</i>".</p>
<i>val</i>	<p>REAL for mkl_sdiamm.</p> <p>DOUBLE PRECISION for mkl_ddiamm.</p> <p>COMPLEX for mkl_cdiamm.</p> <p>DOUBLE COMPLEX for mkl_zdiamm.</p> <p>Two-dimensional array of size <i>lval</i> by <i>ndiag</i>, contains non-zero diagonals of the matrix <i>A</i>. Refer to <i>values</i> array description in Diagonal Storage Scheme for more details.</p>
<i>lval</i>	INTEGER. Leading dimension of <i>val</i> , $lval \geq m$. Refer to <i>lval</i> description in Diagonal Storage Scheme for more details.
<i>idiag</i>	<p>INTEGER. Array of length <i>ndiag</i>, contains the distances between main diagonal and each non-zero diagonals in the matrix <i>A</i>.</p> <p>Refer to <i>distance</i> array description in Diagonal Storage Scheme for more details.</p>
<i>ndiag</i>	INTEGER. Specifies the number of non-zero diagonals of the matrix <i>A</i> .
<i>b</i>	<p>REAL for mkl_sdiamm.</p> <p>DOUBLE PRECISION for mkl_ddiamm.</p> <p>COMPLEX for mkl_cdiamm.</p> <p>DOUBLE COMPLEX for mkl_zdiamm.</p> <p>Array, size (<i>ldb</i>, <i>n</i>).</p>

On entry with *transa* = 'N' or 'n', the leading *k*-by-*n* part of the array *b* must contain the matrix *B*, otherwise the leading *m*-by-*n* part of the array *b* must contain the matrix *B*.

ldb INTEGER. Specifies the leading dimension of *b* as declared in the calling (sub)program.

beta REAL for mkl_sdiamm.
DOUBLE PRECISION for mkl_ddiamm.
COMPLEX for mkl_cdiamm.
DOUBLE COMPLEX for mkl_zdiamm.
Specifies the scalar *beta*.

c REAL for mkl_sdiamm.
DOUBLE PRECISION for mkl_ddiamm.
COMPLEX for mkl_cdiamm.
DOUBLE COMPLEX for mkl_zdiamm.
Array, size *ldc* by *n*.
On entry, the leading *m*-by-*n* part of the array *c* must contain the matrix *C*, otherwise the leading *k*-by-*n* part of the array *c* must contain the matrix *C*.

ldc INTEGER. Specifies the leading dimension of *c* as declared in the calling (sub)program.

Output Parameters

c Overwritten by the matrix ($\alpha A^*B + \beta C$) or ($\alpha A^*B + \beta C$).

Interfaces

mkl_?skymm

Computes matrix-matrix product of a sparse matrix stored using the skyline storage scheme with one-based indexing.

Syntax

```
call mkl_sskymm(transa, m, n, k, alpha, matdescra, val, pntr, b, ldb, beta, c, ldc)
```

```
call mkl_dskymm(transa, m, n, k, alpha, matdescra, val, pntr, b, ldb, beta, c, ldc)
```

```
call mkl_cskymm(transa, m, n, k, alpha, matdescra, val, pntr, b, ldb, beta, c, ldc)
```

```
call mkl_zskymm(transa, m, n, k, alpha, matdescra, val, pntr, b, ldb, beta, c, ldc)
```

Include Files

- mkl.fi

Description

The `mk1_?skymm` routine performs a matrix-matrix operation defined as

$$C := \alpha * A * B + \beta * C$$

or

$$C := \alpha * A' * B + \beta * C,$$

where:

α and β are scalars,

B and C are dense matrices, A is an m -by- k sparse matrix in the skyline storage format, A' is the transpose of A .

NOTE

This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section "**Interfaces**" below.

<i>transa</i>	<p>CHARACTER*1. Specifies the operation.</p> <p>If <i>transa</i> = 'N' or 'n', then $C := \alpha * A * B + \beta * C$,</p> <p>If <i>transa</i> = 'T' or 't' or 'C' or 'c', then $C := \alpha * A' * B + \beta * C$,</p>
<i>m</i>	INTEGER. Number of rows of the matrix A .
<i>n</i>	INTEGER. Number of columns of the matrix C .
<i>k</i>	INTEGER. Number of columns of the matrix A .
<i>alpha</i>	<p>REAL for <code>mk1_sskymm</code>.</p> <p>DOUBLE PRECISION for <code>mk1_dskymm</code>.</p> <p>COMPLEX for <code>mk1_cskymm</code>.</p> <p>DOUBLE COMPLEX for <code>mk1_zskymm</code>.</p> <p>Specifies the scalar α.</p>
<i>matdescra</i>	<p>CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table "Possible Values of the Parameter <i>matdescra</i> (<i>descra</i>)". Possible combinations of element values of this parameter are given in Table "Possible Combinations of Element Values of the Parameter <i>matdescra</i>".</p>

NOTE

General matrices (*matdescra* (1)='G') is not supported.

val REAL for `mk1_sskymm`.

DOUBLE PRECISION for mkl_dskymm.

COMPLEX for mkl_cskymm.

DOUBLE COMPLEX for mkl_zskymm.

Array containing the set of elements of the matrix A in the skyline profile form.

If $matdescrsa(2) = 'L'$, then val contains elements from the low triangle of the matrix A .

If $matdescrsa(2) = 'U'$, then val contains elements from the upper triangle of the matrix A .

Refer to *values* array description in [Skyline Storage Scheme](#) for more details.

pntr

INTEGER. Array of length $(m + 1)$ for lower triangle, and $(k + 1)$ for upper triangle.

It contains the indices specifying the positions of the first element of the matrix A in each row (for the lower triangle) or column (for upper triangle) in the *val* array. Refer to *pointers* array description in [Skyline Storage Scheme](#) for more details.

b

REAL for mkl_sskymm.

DOUBLE PRECISION for mkl_dskymm.

COMPLEX for mkl_cskymm.

DOUBLE COMPLEX for mkl_zskymm.

Array, size (ldb, n) .

On entry with $transa = 'N'$ or $'n'$, the leading k -by- n part of the array b must contain the matrix B , otherwise the leading m -by- n part of the array b must contain the matrix B .

ldb

INTEGER. Specifies the leading dimension of b as declared in the calling (sub)program.

beta

REAL for mkl_sskymm.

DOUBLE PRECISION for mkl_dskymm.

COMPLEX for mkl_cskymm.

DOUBLE COMPLEX for mkl_zskymm.

Specifies the scalar *beta*.

c

REAL for mkl_sskymm.

DOUBLE PRECISION for mkl_dskymm.

COMPLEX for mkl_cskymm.

DOUBLE COMPLEX for mkl_zskymm.

Array, size ldc by n .

On entry, the leading m -by- n part of the array c must contain the matrix C , otherwise the leading k -by- n part of the array c must contain the matrix C .

ldc INTEGER. Specifies the leading dimension of *c* as declared in the calling (sub)program.

Output Parameters

c Overwritten by the matrix $(\alpha * A * B + \beta * C)$ or $(\alpha * A' * B + \beta * C)$.

Interfaces

mkl_?diasm

Solves a system of linear matrix equations for a sparse matrix in the diagonal format with one-based indexing.

Syntax

```

call mkl_sdiasm(transa, m, n, alpha, matdescra, val, lval, idiag, ndiag, b, ldb, c,
ldc)
call mkl_ddiasm(transa, m, n, alpha, matdescra, val, lval, idiag, ndiag, b, ldb, c,
ldc)
call mkl_cdiasm(transa, m, n, alpha, matdescra, val, lval, idiag, ndiag, b, ldb, c,
ldc)
call mkl_zdiasm(transa, m, n, alpha, matdescra, val, lval, idiag, ndiag, b, ldb, c,
ldc)

```

Include Files

- mkl.fi

Description

The mkl_?diasm routine solves a system of linear equations with matrix-matrix operations for a sparse matrix in the diagonal format:

```
C := alpha*inv(A)*B
```

or

```
C := alpha*inv(A')*B,
```

where:

α is scalar, B and C are dense matrices, A is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, A' is the transpose of A .

NOTE

This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section "**Interfaces**" below.

<i>transa</i>	<p>CHARACTER*1. Specifies the system of linear equations.</p> <p>If <i>transa</i> = 'N' or 'n', then $C := \alpha * \text{inv}(A) * B$,</p> <p>If <i>transa</i> = 'T' or 't' or 'C' or 'c', then $C := \alpha * \text{inv}(A') * B$.</p>
<i>m</i>	INTEGER. Number of rows of the matrix <i>A</i> .
<i>n</i>	INTEGER. Number of columns of the matrix <i>C</i> .
<i>alpha</i>	<p>REAL for mkl_sdiasm.</p> <p>DOUBLE PRECISION for mkl_ddiasm.</p> <p>COMPLEX for mkl_cdiasm.</p> <p>DOUBLE COMPLEX for mkl_zdiasm.</p> <p>Specifies the scalar <i>alpha</i>.</p>
<i>matdescra</i>	<p>CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table "Possible Values of the Parameter <i>matdescra</i> (<i>descra</i>)". Possible combinations of element values of this parameter are given in Table "Possible Combinations of Element Values of the Parameter <i>matdescra</i>".</p>
<i>val</i>	<p>REAL for mkl_sdiasm.</p> <p>DOUBLE PRECISION for mkl_ddiasm.</p> <p>COMPLEX for mkl_cdiasm.</p> <p>DOUBLE COMPLEX for mkl_zdiasm.</p> <p>Two-dimensional array of size <i>lval</i> by <i>ndiag</i>, contains non-zero diagonals of the matrix <i>A</i>. Refer to <i>values</i> array description in Diagonal Storage Scheme for more details.</p>
<i>lval</i>	INTEGER. Leading dimension of <i>val</i> , $lval \geq m$. Refer to <i>lval</i> description in Diagonal Storage Scheme for more details.
<i>idiag</i>	<p>INTEGER. Array of length <i>ndiag</i>, contains the distances between main diagonal and each non-zero diagonals in the matrix <i>A</i>.</p>

NOTE

All elements of this array must be sorted in increasing order.

Refer to *distance* array description in [Diagonal Storage Scheme](#) for more details.

<i>ndiag</i>	INTEGER. Specifies the number of non-zero diagonals of the matrix <i>A</i> .
<i>b</i>	<p>REAL for mkl_sdiasm.</p> <p>DOUBLE PRECISION for mkl_ddiasm.</p> <p>COMPLEX for mkl_cdiasm.</p> <p>DOUBLE COMPLEX for mkl_zdiasm.</p>

Array, size (ldb, n) .

On entry the leading m -by- n part of the array b must contain the matrix B .

ldb INTEGER. Specifies the leading dimension of b as declared in the calling (sub)program.

ldc INTEGER. Specifies the leading dimension of c as declared in the calling (sub)program.

Output Parameters

c REAL for mkl_sdiasm.
DOUBLE PRECISION for mkl_ddiasm.
COMPLEX for mkl_cdiasm.
DOUBLE COMPLEX for mkl_zdiasm.
Array, size ldc by n .
The leading m -by- n part of the array c contains the matrix C .

Interfaces

mkl_?skysm

Solves a system of linear matrix equations for a sparse matrix stored using the skyline storage scheme with one-based indexing.

Syntax

```

call mkl_sskysm(transa, m, n, alpha, matdescra, val, pntr, b, ldb, c, ldc)
call mkl_dskysm(transa, m, n, alpha, matdescra, val, pntr, b, ldb, c, ldc)
call mkl_cskysm(transa, m, n, alpha, matdescra, val, pntr, b, ldb, c, ldc)
call mkl_zskysm(transa, m, n, alpha, matdescra, val, pntr, b, ldb, c, ldc)

```

Include Files

- mkl.fi

Description

The `mkl_?skysm` routine solves a system of linear equations with matrix-matrix operations for a sparse matrix in the skyline storage format:

```
C := alpha*inv(A)*B
```

or

```
C := alpha*inv(A')*B,
```

where:

alpha is scalar, *B* and *C* are dense matrices, *A* is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, *A'* is the transpose of *A*.

NOTE

This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section "**Interfaces**" below.

<i>transa</i>	<p>CHARACTER*1. Specifies the system of linear equations.</p> <p>If <i>transa</i> = 'N' or 'n', then $C := \alpha * \text{inv}(A) * B$,</p> <p>If <i>transa</i> = 'T' or 't' or 'C' or 'c', then $C := \alpha * \text{inv}(A') * B$,</p>
<i>m</i>	INTEGER. Number of rows of the matrix <i>A</i> .
<i>n</i>	INTEGER. Number of columns of the matrix <i>C</i> .
<i>alpha</i>	<p>REAL for mkl_sskysm.</p> <p>DOUBLE PRECISION for mkl_dskysm.</p> <p>COMPLEX for mkl_cskysm.</p> <p>DOUBLE COMPLEX for mkl_zskysm.</p> <p>Specifies the scalar <i>alpha</i>.</p>
<i>matdescra</i>	<p>CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table "Possible Values of the Parameter <i>matdescra</i> (<i>descra</i>)". Possible combinations of element values of this parameter are given in Table "Possible Combinations of Element Values of the Parameter <i>matdescra</i>".</p>

NOTE

General matrices (*matdescra*(1)='G') is not supported.

<i>val</i>	<p>REAL for mkl_sskysm.</p> <p>DOUBLE PRECISION for mkl_dskysm.</p> <p>COMPLEX for mkl_cskysm.</p> <p>DOUBLE COMPLEX for mkl_zskysm.</p> <p>Array containing the set of elements of the matrix <i>A</i> in the skyline profile form.</p> <p>If <i>matdescra</i>(2) = 'L', then <i>val</i> contains elements from the low triangle of the matrix <i>A</i>.</p> <p>If <i>matdescra</i>(2) = 'U', then <i>val</i> contains elements from the upper triangle of the matrix <i>A</i>.</p> <p>Refer to <i>values</i> array description in Skyline Storage Scheme for more details.</p>

Description

This routine converts a sparse matrix *A* between formats: stored as a rectangular array (dense representation) and stored using compressed sparse row (CSR) format (3-array variation).

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section "**Interfaces**" below.

<i>job</i>	<p>INTEGER</p> <p>Array, contains the following conversion parameters:</p> <ul style="list-style-type: none"> • <i>job</i>(1) : Conversion type. <ul style="list-style-type: none"> • If <i>job</i>(1)=0, the rectangular matrix <i>A</i> is converted to the CSR format; • if <i>job</i>(1)=1, the rectangular matrix <i>A</i> is restored from the CSR format. • <i>job</i>(2) : index base for the rectangular matrix <i>A</i>. <ul style="list-style-type: none"> • If <i>job</i>(2)=0, zero-based indexing for the rectangular matrix <i>A</i> is used; • if <i>job</i>(2)=1, one-based indexing for the rectangular matrix <i>A</i> is used. • <i>job</i>(3) : Index base for the matrix in CSR format. <ul style="list-style-type: none"> • If <i>job</i>(3)=0, zero-based indexing for the matrix in CSR format is used; • if <i>job</i>(3)=1, one-based indexing for the matrix in CSR format is used. • <i>job</i>(4) : Portion of matrix. <ul style="list-style-type: none"> • If <i>job</i>(4)=0, <i>adns</i> is a lower triangular part of matrix <i>A</i>; • If <i>job</i>(4)=1, <i>adns</i> is an upper triangular part of matrix <i>A</i>; • If <i>job</i>(4)=2, <i>adns</i> is a whole matrix <i>A</i>. • <i>job</i>(5)=<i>nzmax</i>: maximum number of the non-zero elements allowed if <i>job</i>(1)=0. • <i>job</i>(6) : job indicator for conversion to CSR format. <ul style="list-style-type: none"> • If <i>job</i>(6)=0, only array <i>ia</i> is generated for the output storage. • If <i>job</i>(6)>0, arrays <i>acsr</i>, <i>ia</i>, <i>ja</i> are generated for the output storage.
<i>m</i>	INTEGER. Number of rows of the matrix <i>A</i> .
<i>n</i>	INTEGER. Number of columns of the matrix <i>A</i> .
<i>adns</i>	<p>(input/output)</p> <p>REAL for mkl_sdnscsr.</p> <p>DOUBLE PRECISION for mkl_ddnscsr.</p> <p>COMPLEX for mkl_cdnscsr.</p> <p>DOUBLE COMPLEX for mkl_zdnscsr.</p> <p>If the conversion type is from uncompressed to CSR, on input <i>adns</i> contains an uncompressed (dense) representation of matrix <i>A</i>.</p>
<i>lda</i>	INTEGER. Specifies the leading dimension of <i>adns</i> as declared in the calling (sub)program.

For zero-based indexing of A , lda must be at least $\max(1, n)$.

For one-based indexing of A , lda must be at least $\max(1, m)$.

acsr

(input/output)

REAL for mkl_sdnscsr.

DOUBLE PRECISION for mkl_ddnscsr.

COMPLEX for mkl_cdnscsr.

DOUBLE COMPLEX for mkl_zdnscsr.

If conversion type is from CSR to uncompressed, on input *acsr* contains the non-zero elements of the matrix A . Its length is equal to the number of non-zero elements in the matrix A . Refer to *values* array description in [Sparse Matrix Storage Formats](#) for more details.

ja

(input/output)INTEGER. If conversion type is from CSR to uncompressed, on input *ja* contains the column indices for each non-zero element of the matrix A .

Its length is equal to the length of the array *acsr*. Refer to *columns* array description in [Sparse Matrix Storage Formats](#) for more details.

ia

(input/output)INTEGER. Array of length $m + 1$.

If conversion type is from CSR to uncompressed, on input *ia* contains indices of elements in the array *acsr*, such that $ia(i)$ is the index in the array *acsr* of the first non-zero element from the row i .

The value of $ia(m + 1)$ is equal to the number of non-zeros plus one. Refer to *rowIndex* array description in [Sparse Matrix Storage Formats](#) for more details.

Output Parameters

adns

If conversion type is from CSR to uncompressed, on output *adns* contains the uncompressed (dense) representation of matrix A .

acsr, ja, ia

If conversion type is from uncompressed to CSR, on output *acsr*, *ja*, and *ia* contain the compressed sparse row (CSR) format (3-array variation) of matrix A (see [Sparse Matrix Storage Formats](#) for a description of the storage format).

info

INTEGER. Integer info indicator only for restoring the matrix A from the CSR format.

If $info=0$, the execution is successful.

If $info=i$, the routine is interrupted processing the i -th row because there is no space in the arrays *acsr* and *ja* according to the value *nzmax*.

Interfaces

INTEGER      ja(*), ia(m+1)
```

```
DOUBLE COMPLEX  adns(*), acsr(*)
```

mkl_?csrcoo

Converts a sparse matrix in the CSR format to the coordinate format and vice versa.

Syntax

```
call mkl_scsrcoo(job, n, acsr, ja, ia, nnz, acoo, rowind, colind, info)
```

```
call mkl_dcsrcoo(job, n, acsr, ja, ia, nnz, acoo, rowind, colind, info)
```

```
call mkl_ccsrcoo(job, n, acsr, ja, ia, nnz, acoo, rowind, colind, info)
```

```
call mkl_zcsrcoo(job, n, acsr, ja, ia, nnz, acoo, rowind, colind, info)
```

Description

This routine converts a sparse matrix A stored in the compressed sparse row (CSR) format (3-array variation) to coordinate format and vice versa.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section "**Interfaces**" below.

<i>job</i>	<p>INTEGER</p> <p>Array, contains the following conversion parameters:</p> <p><i>job</i>(1)</p> <p>If <i>job</i>(1)=0, the matrix in the CSR format is converted to the coordinate format;</p> <p>if <i>job</i>(1)=1, the matrix in the coordinate format is converted to the CSR format.</p> <p>if <i>job</i>(1)=2, the matrix in the coordinate format is converted to the CSR format, and the column indices in CSR representation are sorted in the increasing order within each row.</p> <p><i>job</i>(2)</p> <p>If <i>job</i>(2)=0, zero-based indexing for the matrix in CSR format is used;</p> <p>if <i>job</i>(2)=1, one-based indexing for the matrix in CSR format is used.</p> <p><i>job</i>(3)</p> <p>If <i>job</i>(3)=0, zero-based indexing for the matrix in coordinate format is used;</p> <p>if <i>job</i>(3)=1, one-based indexing for the matrix in coordinate format is used.</p> <p><i>job</i>(5)</p> <p><i>job</i>(5)=<i>nzmax</i> - maximum number of the non-zero elements allowed if <i>job</i>(1)=0.</p> <p><i>job</i>(6) - job indicator.</p> <p>For conversion to the coordinate format:</p> <p>If <i>job</i>(6)=1, only array <i>rowind</i> is filled in for the output storage.</p> <p>If <i>job</i>(6)=2, arrays <i>rowind</i>, <i>colind</i> are filled in for the output storage.</p> <p>If <i>job</i>(6)=3, all arrays <i>rowind</i>, <i>colind</i>, <i>acoo</i> are filled in for the output storage.</p> <p>For conversion to the CSR format:</p> <p>If <i>job</i>(6)=0, all arrays <i>acsr</i>, <i>ja</i>, <i>ia</i> are filled in for the output storage.</p> <p>If <i>job</i>(6)=1, only array <i>ia</i> is filled in for the output storage.</p> <p>If <i>job</i>(6)=2, then it is assumed that the routine already has been called with the <i>job</i>(6)=1, and the user allocated the required space for storing the output arrays <i>acsr</i> and <i>ja</i>.</p>
<i>n</i>	INTEGER. Dimension of the matrix <i>A</i> .
<i>nnz</i>	<p>INTEGER. Specifies the number of non-zero elements of the matrix <i>A</i> for <i>job</i>(1)≠0.</p>

Refer to *nnz* description in [Coordinate Format](#) for more details.

acsr

(input/output)

REAL for mkl_scsrcoo.

DOUBLE PRECISION for mkl_dcsrcoo.

COMPLEX for mkl_ccsrcoo.

DOUBLE COMPLEX for mkl_zcsrcoo.

Array containing non-zero elements of the matrix *A*. Its length is equal to the number of non-zero elements in the matrix *A*. Refer to *values* array description in [Sparse Matrix Storage Formats](#) for more details.

ja

(input/output) INTEGER. Array containing the column indices for each non-zero element of the matrix *A*.

Its length is equal to the length of the array *acsr*. Refer to *columns* array description in [Sparse Matrix Storage Formats](#) for more details.

ia

(input/output) INTEGER. Array of length $n + 1$, containing indices of elements in the array *acsr*, such that $ia(i)$ is the index in the array *acsr* of the first non-zero element from the row *i*. The value of the last element $ia(n + 1)$ is equal to the number of non-zeros plus one. Refer to *rowIndex* array description in [Sparse Matrix Storage Formats](#) for more details.

acoo

(input/output)

REAL for mkl_scsrcoo.

DOUBLE PRECISION for mkl_dcsrcoo.

COMPLEX for mkl_ccsrcoo.

DOUBLE COMPLEX for mkl_zcsrcoo.

Array containing non-zero elements of the matrix *A*. Its length is equal to the number of non-zero elements in the matrix *A*. Refer to *values* array description in [Sparse Matrix Storage Formats](#) for more details.

rowind

(input/output) INTEGER. Array of length *nnz*, contains the row indices for each non-zero element of the matrix *A*.

Refer to *rows* array description in [Coordinate Format](#) for more details.

colind

(input/output) INTEGER. Array of length *nnz*, contains the column indices for each non-zero element of the matrix *A*. Refer to *columns* array description in [Coordinate Format](#) for more details.

Output Parameters

nnz

Returns the number of converted elements of the matrix *A* for *job*(1)=0.

info

INTEGER. Integer info indicator only for converting the matrix *A* from the CSR format.

If *info*=0, the execution is successful.

If *info*=1, the routine is interrupted because there is no space in the arrays *acoo*, *rowind*, *colind* according to the value *nzmax*.

Description

This routine converts a sparse matrix *A* stored in the compressed sparse row (CSR) format (3-array variation) to the block sparse row (BSR) format and vice versa.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section "**Interfaces**" below.

<i>job</i>	<p>INTEGER</p> <p>Array, contains the following conversion parameters:</p> <p><i>job</i>(1)</p> <p>If <i>job</i>(1)=0, the matrix in the CSR format is converted to the BSR format; if <i>job</i>(1)=1, the matrix in the BSR format is converted to the CSR format.</p> <p><i>job</i>(2)</p> <p>If <i>job</i>(2)=0, zero-based indexing for the matrix in CSR format is used; if <i>job</i>(2)=1, one-based indexing for the matrix in CSR format is used.</p> <p><i>job</i>(3)</p> <p>If <i>job</i>(3)=0, zero-based indexing for the matrix in the BSR format is used; if <i>job</i>(3)=1, one-based indexing for the matrix in the BSR format is used.</p> <p><i>job</i>(4) is only used for conversion to CSR format. By default, the converter saves the blocks without checking whether an element is zero or not. If <i>job</i>(4)=1, then the converter only saves non-zero elements in blocks.</p> <p><i>job</i>(6) - job indicator.</p> <p>For conversion to the BSR format:</p> <p>If <i>job</i>(6)=0, only arrays <i>jab</i>, <i>iab</i> are generated for the output storage. If <i>job</i>(6)>0, all output arrays <i>absr</i>, <i>jab</i>, and <i>iab</i> are filled in for the output storage. If <i>job</i>(6)=-1, <i>iab</i>(1) returns the number of non-zero blocks.</p> <p>For conversion to the CSR format:</p> <p>If <i>job</i>(6)=0, only arrays <i>ja</i>, <i>ia</i> are generated for the output storage.</p>
<i>m</i>	<p>INTEGER. Actual row dimension of the matrix <i>A</i> for convert to the BSR format; block row dimension of the matrix <i>A</i> for convert to the CSR format.</p>
<i>mblk</i>	<p>INTEGER. Size of the block in the matrix <i>A</i>.</p>
<i>ldabsr</i>	<p>INTEGER. Leading dimension of the array <i>absr</i> as declared in the calling program. <i>ldabsr</i> must be greater than or equal to <i>mblk</i>*<i>mblk</i>.</p>
<i>acsr</i>	<p>(input/output)</p> <p>REAL for mkl_scsrbsr.</p> <p>DOUBLE PRECISION for mkl_dcsrbsr.</p> <p>COMPLEX for mkl_ccsrbsr.</p>

DOUBLE COMPLEX for mkl_zcsrbsr.

Array containing non-zero elements of the matrix *A*. Its length is equal to the number of non-zero elements in the matrix *A*. Refer to *values* array description in [Sparse Matrix Storage Formats](#) for more details.

ja

(input/output)INTEGER. Array containing the column indices for each non-zero element of the matrix *A*.

Its length is equal to the length of the array *acsr*. Refer to *columns* array description in [Sparse Matrix Storage Formats](#) for more details.

ia

(input/output)INTEGER. Array of length $m + 1$, containing indices of elements in the array *acsr*, such that $ia(I)$ is the index in the array *acsr* of the first non-zero element from the row *I*. The value of the last element $ia(m + 1)$ is equal to the number of non-zeros plus one. Refer to *rowIndex* array description in [Sparse Matrix Storage Formats](#) for more details.

absr

(input/output)

REAL for mkl_scsrbsr.

DOUBLE PRECISION for mkl_dcsrbsr.

COMPLEX for mkl_ccsrbsr.

DOUBLE COMPLEX for mkl_zcsrbsr.

Array containing elements of non-zero blocks of the matrix *A*. Its length is equal to the number of non-zero blocks in the matrix *A* multiplied by $mblk * mblk$. Refer to *values* array description in [BSR Format](#) for more details.

jab

(input/output)INTEGER. Array containing the column indices for each non-zero block of the matrix *A*.

Its length is equal to the number of non-zero blocks of the matrix *A*. Refer to *columns* array description in [BSR Format](#) for more details.

iab

(input/output)INTEGER. Array of length $(m + 1)$, containing indices of blocks in the array *absr*, such that $iab(i)$ is the index in the array *absr* of the first non-zero element from the *i*-th row. The value of the last element $iab(m + 1)$ is equal to the number of non-zero blocks plus one. Refer to *rowIndex* array description in [BSR Format](#) for more details.

Output Parameters

info

INTEGER. Integer info indicator only for converting the matrix *A* from the CSR format.

If $info=0$, the execution is successful.

If $info=1$, it means that *mblk* is equal to 0.

If $info=2$, it means that *ldabsr* is less than $mblk * mblk$ and there is no space for all blocks.

Interfaces

FORTRAN 77:

<i>m</i>	INTEGER. Dimension of the square matrix A.
<i>acsr</i>	<p>(input/output)</p> <p>REAL for mkl_scsrsc.</p> <p>DOUBLE PRECISION for mkl_dcsrsc.</p> <p>COMPLEX for mkl_ccsrsc.</p> <p>DOUBLE COMPLEX for mkl_zcsrsc.</p> <p>Array containing non-zero elements of the square matrix A. Its length is equal to the number of non-zero elements in the matrix A. Refer to <i>values</i> array description in Sparse Matrix Storage Formats for more details.</p>
<i>ja</i>	<p>(input/output)INTEGER. Array containing the column indices for each non-zero element of the matrix A.</p> <p>Its length is equal to the length of the array <i>acsr</i>. Refer to <i>columns</i> array description in Sparse Matrix Storage Formats for more details.</p>

<i>ia</i>	(input/output)INTEGER. Array of length $m + 1$, containing indices of elements in the array <i>acsr</i> , such that <i>ia</i> (<i>i</i>) is the index in the array <i>acsr</i> of the first non-zero element from the row <i>i</i> . The value of the last element <i>ia</i> ($m + 1$) is equal to the number of non-zeros plus one. Refer to <i>rowIndex</i> array description in Sparse Matrix Storage Formats for more details.
<i>acsc</i>	(input/output) REAL for mkl_scsrsc. DOUBLE PRECISION for mkl_dcsrsc. COMPLEX for mkl_ccsrsc. DOUBLE COMPLEX for mkl_zcsrsc. Array containing non-zero elements of the square matrix A. Its length is equal to the number of non-zero elements in the matrix A. Refer to <i>values</i> array description in Sparse Matrix Storage Formats for more details.
<i>ja1</i>	(input/output)INTEGER. Array containing the row indices for each non-zero element of the matrix A. Its length is equal to the length of the array <i>acsc</i> . Refer to <i>columns</i> array description in Sparse Matrix Storage Formats for more details.
<i>ia1</i>	(input/output)INTEGER. Array of length $m + 1$, containing indices of elements in the array <i>acsc</i> , such that <i>ia1</i> (<i>i</i>) is the index in the array <i>acsc</i> of the first non-zero element from the column <i>i</i> . The value of the last element <i>ia1</i> ($m + 1$) is equal to the number of non-zeros plus one. Refer to <i>rowIndex</i> array description in Sparse Matrix Storage Formats for more details.

Output Parameters

<i>info</i>	INTEGER. This parameter is not used now.

call mkl_ccsrdia(job, m, acsr, ja, ia, adia, ndiag, distance, idiag, acsr_rem, ja_rem, ia_rem, info)
```

```
call mkl_zcsrdia(job, m, acsr, ja, ia, adia, ndiag, distance, idiag, acsr_rem, ja_rem, ia_rem, info)
```

Include Files

- mkl.fi

Description

This routine converts a sparse matrix *A* stored in the compressed sparse row (CSR) format (3-array variation) to the diagonal format and vice versa.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section "**Interfaces**" below.

job INTEGER

Array, contains the following conversion parameters:

job(1)

If *job*(1)=0, the matrix in the CSR format is converted to the diagonal format;

if $job(1)=1$, the matrix in the diagonal format is converted to the CSR format.

$job(2)$

If $job(2)=0$, zero-based indexing for the matrix in CSR format is used;

if $job(2)=1$, one-based indexing for the matrix in CSR format is used.

$job(3)$

If $job(3)=0$, zero-based indexing for the matrix in the diagonal format is used;

if $job(3)=1$, one-based indexing for the matrix in the diagonal format is used.

$job(6)$ - job indicator.

For conversion to the diagonal format:

If $job(6)=0$, diagonals are not selected internally, and $acsr_rem$, ja_rem , ia_rem are not filled in for the output storage.

If $job(6)=1$, diagonals are not selected internally, and $acsr_rem$, ja_rem , ia_rem are filled in for the output storage.

If $job(6)=10$, diagonals are selected internally, and $acsr_rem$, ja_rem , ia_rem are not filled in for the output storage.

If $job(6)=11$, diagonals are selected internally, and csr_rem , ja_rem , ia_rem are filled in for the output storage.

For conversion to the CSR format:

If $job(6)=0$, each entry in the array $adia$ is checked whether it is zero. Zero entries are not included in the array $acsr$.

If $job(6) \neq 0$, each entry in the array $adia$ is not checked whether it is zero.

m

INTEGER. Dimension of the matrix A .

$acsr$

(input/output)

REAL for mkl_scsrdia.

DOUBLE PRECISION for mkl_dcsrdia.

COMPLEX for mkl_ccsrdia.

DOUBLE COMPLEX for mkl_zcsrdia.

Array containing non-zero elements of the matrix A . Its length is equal to the number of non-zero elements in the matrix A . Refer to *values* array description in [Sparse Matrix Storage Formats](#) for more details.

ja

(input/output)INTEGER. Array containing the column indices for each non-zero element of the matrix A .

Its length is equal to the length of the array $acsr$. Refer to *columns* array description in [Sparse Matrix Storage Formats](#) for more details.

ia

(input/output)INTEGER. Array of length $m + 1$, containing indices of elements in the array $acsr$, such that $ia(i)$ is the index in the array $acsr$ of the first non-zero element from the row i . The value of the last

element $ia(m + 1)$ is equal to the number of non-zeros plus one. Refer to *rowIndex* array description in [Sparse Matrix Storage Formats](#) for more details.

adia

(input/output)

REAL for mkl_scsrdia.

DOUBLE PRECISION for mkl_dcsrdia.

COMPLEX for mkl_ccsrdia.

DOUBLE COMPLEX for mkl_zcsrdia.

Array of size (*ndiag* x *idiag*) containing diagonals of the matrix *A*.

The key point of the storage is that each element in the array *adia* retains the row number of the original matrix. To achieve this diagonals in the lower triangular part of the matrix are padded from the top, and those in the upper triangular part are padded from the bottom.

ndiag

INTEGER.

Specifies the leading dimension of the array *adia* as declared in the calling (sub)program, must be at least $\max(1, m)$.

distance

INTEGER.

Array of length *idiag*, containing the distances between the main diagonal and each non-zero diagonal to be extracted. The distance is positive if the diagonal is above the main diagonal, and negative if the diagonal is below the main diagonal. The main diagonal has a distance equal to zero.

idiag

INTEGER.

Number of diagonals to be extracted. For conversion to diagonal format on return this parameter may be modified.

acsr_rem, ja_rem, ia_rem

Remainder of the matrix in the CSR format if it is needed for conversion to the diagonal format.

Output Parameters

info

INTEGER. This parameter is not used now.

Interfaces

mkl_?csrsky

Converts a sparse matrix in CSR format to the skyline format and vice versa.

Syntax

```
call mkl_scsrsky(job, m, acsr, ja, ia, asky, pointers, info)
```

```
call mkl_dcsrsky(job, m, acsr, ja, ia, asky, pointers, info)
```

```
call mkl_ccsrsky(job, m, acsr, ja, ia, asky, pointers, info)
```

```
call mkl_zcsrsky(job, m, acsr, ja, ia, asky, pointers, info)
```

Include Files

- mkl.fi

Description

This routine converts a sparse matrix A stored in the compressed sparse row (CSR) format (3-array variation) to the skyline format and vice versa.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section "**Interfaces**" below.

```
job                                INTEGER
```

Array, contains the following conversion parameters:

job(1)

If *job*(1)=0, the matrix in the CSR format is converted to the skyline format;

if *job*(1)=1, the matrix in the skyline format is converted to the CSR format.

job(2)

If *job*(2)=0, zero-based indexing for the matrix in CSR format is used;

if *job*(2)=1, one-based indexing for the matrix in CSR format is used.

job(3)

If *job*(3)=0, zero-based indexing for the matrix in the skyline format is used;

if *job*(3)=1, one-based indexing for the matrix in the skyline format is used.

job(4)

For conversion to the skyline format:

If *job*(4)=0, the upper part of the matrix *A* in the CSR format is converted.

If *job*(4)=1, the lower part of the matrix *A* in the CSR format is converted.

For conversion to the CSR format:

If *job*(4)=0, the matrix is converted to the upper part of the matrix *A* in the CSR format.

If *job*(4)=1, the matrix is converted to the lower part of the matrix *A* in the CSR format.

job(5)

job(5)=*nzmax* - maximum number of the non-zero elements of the matrix *A* if *job*(1)=0.

job(6) - job indicator.

Only for conversion to the skyline format:

If *job*(6)=0, only arrays *pointers* is filled in for the output storage.

If *job*(6)=1, all output arrays *asky* and *pointers* are filled in for the output storage.

m

INTEGER. Dimension of the matrix *A*.

acsr

(input/output)

REAL for *mkl_scsrsky*.

DOUBLE PRECISION for *mkl_dcsrsky*.

COMPLEX for *mkl_ccsrsky*.

DOUBLE COMPLEX for *mkl_zcsrsky*.

Array containing non-zero elements of the matrix A . Its length is equal to the number of non-zero elements in the matrix A . Refer to *values* array description in [Sparse Matrix Storage Formats](#) for more details.

ja

(input/output)INTEGER. Array containing the column indices for each non-zero element of the matrix A .

Its length is equal to the length of the array *acsr*. Refer to *columns* array description in [Sparse Matrix Storage Formats](#) for more details.

ia

(input/output)INTEGER. Array of length $m + 1$, containing indices of elements in the array *acsr*, such that $ia(i)$ is the index in the array *acsr* of the first non-zero element from the row i . The value of the last element $ia(m + 1)$ is equal to the number of non-zeros plus one. Refer to *rowIndex* array description in [Sparse Matrix Storage Formats](#) for more details.

asky

(input/output)

REAL for mkl_scsrsky.

DOUBLE PRECISION for mkl_dcsrsky.

COMPLEX for mkl_ccsrsky.

DOUBLE COMPLEX for mkl_zcsrsky.

Array, for a lower triangular part of A it contains the set of elements from each row starting from the first non-zero element to and including the diagonal element. For an upper triangular matrix it contains the set of elements from each column of the matrix starting with the first non-zero element down to and including the diagonal element. Encountered zero elements are included in the sets. Refer to *values* array description in [Skyline Storage Format](#) for more details.

pointers

(input/output)INTEGER.

Array with dimension $(m+1)$, where m is number of rows for lower triangle (columns for upper triangle), $pointers(i) - pointers(1) + 1$ gives the index of element in the array *asky* that is first non-zero element in row (column) i . The value of $pointers(m + 1)$ is set to $nnz + pointers(1)$, where nnz is the number of elements in the array *asky*. Refer to *pointers* array description in [Skyline Storage Format](#) for more details

Output Parameters

info

INTEGER. Integer info indicator only for converting the matrix A from the CSR format.

If $info=0$, the execution is successful.

If $info=1$, the routine is interrupted because there is no space in the array *asky* according to the value *nzmax*.

mkl_?csradd

Computes the sum of two matrices stored in the CSR format (3-array variation) with one-based indexing.

Syntax

```
call mkl_scsradd(trans, request, sort, m, n, a, ja, ia, beta, b, jb, ib, c, jc, ic, nzmax, info)
```

```
call mkl_dcsradd(trans, request, sort, m, n, a, ja, ia, beta, b, jb, ib, c, jc, ic, nzmax, info)
```

```
call mkl_ccsradd(trans, request, sort, m, n, a, ja, ia, beta, b, jb, ib, c, jc, ic, nzmax, info)
```

```
call mkl_zcsradd(trans, request, sort, m, n, a, ja, ia, beta, b, jb, ib, c, jc, ic, nzmax, info)
```

Include Files

- `mkl.fi`

Description

The `mkl_?csradd` routine performs a matrix-matrix operation defined as

$$C := A + \text{beta} * \text{op}(B)$$

where:

A , B , C are the sparse matrices in the CSR format (3-array variation).

$\text{op}(B)$ is one of $\text{op}(B) = B$, or $\text{op}(B) = B'$, or $\text{op}(A) = \text{conjg}(B')$

beta is a scalar.

The routine works correctly if and only if the column indices in sparse matrix representations of matrices A and B are arranged in the increasing order for each row. If not, use the parameter `sort` (see below) to reorder column indices and the corresponding elements of the input matrices.

NOTE

This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section "**Interfaces**" below.

<i>trans</i>	<p>CHARACTER*1. Specifies the operation.</p> <p>If <i>trans</i> = 'N' or 'n', then $C := A + \text{beta} * B$</p> <p>If <i>trans</i> = 'T' or 't' or 'C' or 'c', then $C := A + \text{beta} * B'$.</p>
<i>request</i>	<p>INTEGER.</p> <p>If <i>request</i>=0, the routine performs addition. The memory for the output arrays <i>ic</i>, <i>jc</i>, <i>c</i> must be allocated beforehand.</p> <p>If <i>request</i>=1, the routine only computes the values of the array <i>ic</i> of length $m + 1$. The memory for the <i>ic</i> array must be allocated beforehand. On exit the value $ic(m+1) - 1$ is the actual number of the elements in the arrays <i>c</i> and <i>jc</i>.</p> <p>If <i>request</i>=2, after the routine is called previously with the parameter <i>request</i>=1 and after the output arrays <i>jc</i> and <i>c</i> are allocated in the calling program with length at least $ic(m+1) - 1$, the routine performs addition.</p>
<i>sort</i>	<p>INTEGER. Specifies the type of reordering. If this parameter is not set (default), the routine does not perform reordering.</p> <p>If <i>sort</i>=1, the routine arranges the column indices <i>ja</i> for each row in the increasing order and reorders the corresponding values of the matrix <i>A</i> in the array <i>a</i>.</p> <p>If <i>sort</i>=2, the routine arranges the column indices <i>jb</i> for each row in the increasing order and reorders the corresponding values of the matrix <i>B</i> in the array <i>b</i>.</p>

If *sort=3*, the routine performs reordering for both input matrices *A* and *B*.

m INTEGER. Number of rows of the matrix *A*.

n INTEGER. Number of columns of the matrix *A*.

a REAL for mkl_scsradd.
DOUBLE PRECISION for mkl_dcsradd.
COMPLEX for mkl_ccsradd.
DOUBLE COMPLEX for mkl_zcsradd.

Array containing non-zero elements of the matrix *A*. Its length is equal to the number of non-zero elements in the matrix *A*. Refer to *values* array description in [Sparse Matrix Storage Formats](#) for more details.

ja INTEGER. Array containing the column indices for each non-zero element of the matrix *A*. For each row the column indices must be arranged in the increasing order.

The length of this array is equal to the length of the array *a*. Refer to *columns* array description in [Sparse Matrix Storage Formats](#) for more details.

ia INTEGER. Array of length $m + 1$, containing indices of elements in the array *a*, such that *ia*(*i*) is the index in the array *a* of the first non-zero element from the row *i*. The value of the last element *ia*($m + 1$) is equal to the number of non-zero elements of the matrix *A* plus one. Refer to *rowIndex* array description in [Sparse Matrix Storage Formats](#) for more details.

beta REAL for mkl_scsradd.
DOUBLE PRECISION for mkl_dcsradd.
COMPLEX for mkl_ccsradd.
DOUBLE COMPLEX for mkl_zcsradd.

Specifies the scalar *beta*.

b REAL for mkl_scsradd.
DOUBLE PRECISION for mkl_dcsradd.
COMPLEX for mkl_ccsradd.
DOUBLE COMPLEX for mkl_zcsradd.

Array containing non-zero elements of the matrix *B*. Its length is equal to the number of non-zero elements in the matrix *B*. Refer to *values* array description in [Sparse Matrix Storage Formats](#) for more details.

jb INTEGER. Array containing the column indices for each non-zero element of the matrix *B*. For each row the column indices must be arranged in the increasing order.

The length of this array is equal to the length of the array *b*. Refer to *columns* array description in [Sparse Matrix Storage Formats](#) for more details.

<i>ib</i>	<p>INTEGER. Array of length $m + 1$ when <i>trans</i> = 'N' or 'n', or $n + 1$ otherwise.</p> <p>This array contains indices of elements in the array <i>b</i>, such that <i>ib</i>(<i>i</i>) is the index in the array <i>b</i> of the first non-zero element from the row <i>i</i>. The value of the last element <i>ib</i>($m + 1$) or <i>ib</i>($n + 1$) is equal to the number of non-zero elements of the matrix <i>B</i> plus one. Refer to <i>rowIndex</i> array description in Sparse Matrix Storage Formats for more details.</p>
<i>nzmax</i>	<p>INTEGER. The length of the arrays <i>c</i> and <i>jc</i>.</p> <p>This parameter is used only if <i>request</i>=0. The routine stops calculation if the number of elements in the result matrix <i>C</i> exceeds the specified value of <i>nzmax</i>.</p>

Output Parameters

<i>c</i>	<p>REAL for mkl_scsradd.</p> <p>DOUBLE PRECISION for mkl_dcsradd.</p> <p>COMPLEX for mkl_ccsradd.</p> <p>DOUBLE COMPLEX for mkl_zcsradd.</p> <p>Array containing non-zero elements of the result matrix <i>C</i>. Its length is equal to the number of non-zero elements in the matrix <i>C</i>. Refer to <i>values</i> array description in Sparse Matrix Storage Formats for more details.</p>
<i>jc</i>	<p>INTEGER. Array containing the column indices for each non-zero element of the matrix <i>C</i>.</p> <p>The length of this array is equal to the length of the array <i>c</i>. Refer to <i>columns</i> array description in Sparse Matrix Storage Formats for more details.</p>
<i>ic</i>	<p>INTEGER. Array of length $m + 1$, containing indices of elements in the array <i>c</i>, such that <i>ic</i>(<i>i</i>) is the index in the array <i>c</i> of the first non-zero element from the row <i>i</i>. The value of the last element <i>ic</i>($m + 1$) is equal to the number of non-zero elements of the matrix <i>C</i> plus one. Refer to <i>rowIndex</i> array description in Sparse Matrix Storage Formats for more details.</p>
<i>info</i>	<p>INTEGER.</p> <p>If <i>info</i>=0, the execution is successful.</p> <p>If <i>info</i>=<i>I</i>>0, the routine stops calculation in the <i>I</i>-th row of the matrix <i>C</i> because number of elements in <i>C</i> exceeds <i>nzmax</i>.</p> <p>If <i>info</i>=-1, the routine calculates only the size of the arrays <i>c</i> and <i>jc</i> and returns this value plus 1 as the last element of the array <i>ic</i>.</p>

call mkl_zcsrmultcsr(trans, request, sort, m, n, k, a, ja, ia, b, jb, ib, c, jc, ic, nzmax, info)

Include Files

- `mkl.fi`

Description

The `mkl_?csrmultcsr` routine performs a matrix-matrix operation defined as

$$C := \text{op}(A) * B$$

where:

A, B, C are the sparse matrices in the CSR format (3-array variation);

$\text{op}(A)$ is one of $\text{op}(A) = A$, or $\text{op}(A) = A'$, or $\text{op}(A) = \text{conjg}(A')$.

You can use the parameter `sort` to perform or not perform reordering of non-zero entries in input and output sparse matrices. The purpose of reordering is to rearrange non-zero entries in compressed sparse row matrix so that column indices in compressed sparse representation are sorted in the increasing order for each row.

The following table shows correspondence between the value of the parameter `sort` and the type of reordering performed by this routine for each sparse matrix involved:

Value of the parameter <i>sort</i>	Reordering of <i>A</i> (arrays <i>a, ja, ia</i>)	Reordering of <i>B</i> (arrays <i>b, jb, ib</i>)	Reordering of <i>C</i> (arrays <i>c, jc, ic</i>)
1	yes	no	yes
2	no	yes	yes
3	yes	yes	yes
4	yes	no	no
5	no	yes	no
6	yes	yes	no
7	no	no	no
arbitrary value not equal to 1, 2,..., 7	no	no	yes

NOTE

This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section "**Interfaces**" below.

<i>trans</i>	CHARACTER*1. Specifies the operation. If <i>trans</i> = 'N' or 'n', then $C := A * B$ If <i>trans</i> = 'T' or 't' or 'C' or 'c', then $C := A' * B$.
<i>request</i>	INTEGER. If <i>request</i> =0, the routine performs multiplication, the memory for the output arrays <i>ic, jc, c</i> must be allocated beforehand.

If *request*=1, the routine computes only values of the array *ic* of length *m* + 1, the memory for this array must be allocated beforehand. On exit the value *ic*(*m*+1) - 1 is the actual number of the elements in the arrays *c* and *jc*.

If *request*=2, the routine has been called previously with the parameter *request*=1, the output arrays *jc* and *c* are allocated in the calling program and they are of the length *ic*(*m*+1) - 1 at least.

<i>sort</i>	INTEGER. Specifies whether the routine performs reordering of non-zeros entries in input and/or output sparse matrices (see table above).
<i>m</i>	INTEGER. Number of rows of the matrix <i>A</i> .
<i>n</i>	INTEGER. Number of columns of the matrix <i>A</i> .
<i>k</i>	INTEGER. Number of columns of the matrix <i>B</i> .
<i>a</i>	REAL for <code>mkl_scsrmultcsr</code> . DOUBLE PRECISION for <code>mkl_dcsrmultcsr</code> . COMPLEX for <code>mkl_ccsrmultcsr</code> . DOUBLE COMPLEX for <code>mkl_zcsrmultcsr</code> . Array containing non-zero elements of the matrix <i>A</i> . Its length is equal to the number of non-zero elements in the matrix <i>A</i> . Refer to <i>values</i> array description in Sparse Matrix Storage Formats for more details.
<i>ja</i>	INTEGER. Array containing the column indices for each non-zero element of the matrix <i>A</i> . For each row the column indices must be arranged in the increasing order. The length of this array is equal to the length of the array <i>a</i> . Refer to <i>columns</i> array description in Sparse Matrix Storage Formats for more details.
<i>ia</i>	INTEGER. Array of length <i>m</i> + 1. This array contains indices of elements in the array <i>a</i> , such that <i>ia</i> (<i>i</i>) is the index in the array <i>a</i> of the first non-zero element from the row <i>i</i> . The value of the last element <i>ia</i> (<i>m</i> + 1) is equal to the number of non-zero elements of the matrix <i>A</i> plus one. Refer to <i>rowIndex</i> array description in Sparse Matrix Storage Formats for more details.
<i>b</i>	REAL for <code>mkl_scsrmultcsr</code> . DOUBLE PRECISION for <code>mkl_dcsrmultcsr</code> . COMPLEX for <code>mkl_ccsrmultcsr</code> . DOUBLE COMPLEX for <code>mkl_zcsrmultcsr</code> . Array containing non-zero elements of the matrix <i>B</i> . Its length is equal to the number of non-zero elements in the matrix <i>B</i> . Refer to <i>values</i> array description in Sparse Matrix Storage Formats for more details.

jb INTEGER. Array containing the column indices for each non-zero element of the matrix *B*. For each row the column indices must be arranged in the increasing order.

The length of this array is equal to the length of the array *b*. Refer to *columns* array description in [Sparse Matrix Storage Formats](#) for more details.

ib INTEGER. Array of length $n + 1$ when *trans* = 'N' or 'n', or $m + 1$ otherwise.

This array contains indices of elements in the array *b*, such that *ib*(*i*) is the index in the array *b* of the first non-zero element from the row *i*. The value of the last element *ib*($n + 1$) or *ib*($m + 1$) is equal to the number of non-zero elements of the matrix *B* plus one. Refer to *rowIndex* array description in [Sparse Matrix Storage Formats](#) for more details.

nzmax INTEGER. The length of the arrays *c* and *jc*.

This parameter is used only if *request*=0. The routine stops calculation if the number of elements in the result matrix *C* exceeds the specified value of *nzmax*.

Output Parameters

c REAL for mkl_scsrmultcsr.
DOUBLE PRECISION for mkl_dcsrmultcsr.
COMPLEX for mkl_ccsrmultcsr.
DOUBLE COMPLEX for mkl_zcsrmultcsr.

Array containing non-zero elements of the result matrix *C*. Its length is equal to the number of non-zero elements in the matrix *C*. Refer to *values* array description in [Sparse Matrix Storage Formats](#) for more details.

jc INTEGER. Array containing the column indices for each non-zero element of the matrix *C*.

The length of this array is equal to the length of the array *c*. Refer to *columns* array description in [Sparse Matrix Storage Formats](#) for more details.

ic INTEGER. Array of length $m + 1$ when *trans* = 'N' or 'n', or $n + 1$ otherwise.

This array contains indices of elements in the array *c*, such that *ic*(*i*) is the index in the array *c* of the first non-zero element from the row *i*. The value of the last element *ic*($m + 1$) or *ic*($n + 1$) is equal to the number of non-zero elements of the matrix *C* plus one. Refer to *rowIndex* array description in [Sparse Matrix Storage Formats](#) for more details.

info INTEGER.

If *info*=0, the execution is successful.

If *info*=*I*>0, the routine stops calculation in the *I*-th row of the matrix *C* because number of elements in *C* exceeds *nzmax*.

If *info*=-1, the routine calculates only the size of the arrays *c* and *jc* and returns this value plus 1 as the last element of the array *ic*.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_scsrmultcsr( trans, request, sort, m, n, k, a, ja, ia, b, jb, ib, c, jc, ic, nzmax, info)
```

CHARACTER*1 trans

INTEGER request, sort, m, n, k, nzmax, info

```
SUBROUTINE mkl_zcscrmultcsr( trans, request, sort, m, n, k, a, ja, ia, b, jb, ib, c, jc, ic, nzmax, info)
```

CHARACTER*1 trans

INTEGER request, sort, m, n, k, nzmax, info

INTEGER ja(*), jb(*), jc(*), ia(*), ib(*), ic(*)

DOUBLE COMPLEX a(*), b(*), c(*)

mkl_?cscrmultd

Computes product of two sparse matrices stored in the CSR format (3-array variation) with one-based indexing. The result is stored in the dense matrix.

Syntax

```
call mkl_scsrmultd(trans, m, n, k, a, ja, ia, b, jb, ib, c, ldc)
```

```
call mkl_dcscrmultd(trans, m, n, k, a, ja, ia, b, jb, ib, c, ldc)
```

```
call mkl_ccscrmultd(trans, m, n, k, a, ja, ia, b, jb, ib, c, ldc)
```

```
call mkl_zcscrmultd(trans, m, n, k, a, ja, ia, b, jb, ib, c, ldc)
```

Include Files

- `mkl.fi`

Description

The `mkl_?csrmultd` routine performs a matrix-matrix operation defined as

$$C := \text{op}(A) * B$$

where:

A , B are the sparse matrices in the CSR format (3-array variation), C is dense matrix;

$\text{op}(A)$ is one of $\text{op}(A) = A$, or $\text{op}(A) = A'$, or $\text{op}(A) = \text{conjg}(A')$.

The routine works correctly if and only if the column indices in sparse matrix representations of matrices A and B are arranged in the increasing order for each row.

NOTE

This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section "**Interfaces**" below.

<i>trans</i>	<p>CHARACTER*1. Specifies the operation.</p> <p>If <i>trans</i> = 'N' or 'n', then $C := A * B$</p> <p>If <i>trans</i> = 'T' or 't' or 'C' or 'c', then $C := A' * B$.</p>
<i>m</i>	INTEGER. Number of rows of the matrix A .
<i>n</i>	INTEGER. Number of columns of the matrix A .
<i>k</i>	INTEGER. Number of columns of the matrix B .
<i>a</i>	<p>REAL for <code>mkl_scsrmultd</code>.</p> <p>DOUBLE PRECISION for <code>mkl_dcsrmultd</code>.</p> <p>COMPLEX for <code>mkl_ccsrmultd</code>.</p> <p>DOUBLE COMPLEX for <code>mkl_zcsrmultd</code>.</p> <p>Array containing non-zero elements of the matrix A. Its length is equal to the number of non-zero elements in the matrix A. Refer to <i>values</i> array description in Sparse Matrix Storage Formats for more details.</p>
<i>ja</i>	<p>INTEGER. Array containing the column indices for each non-zero element of the matrix A. For each row the column indices must be arranged in the increasing order.</p> <p>The length of this array is equal to the length of the array <i>a</i>. Refer to <i>columns</i> array description in Sparse Matrix Storage Formats for more details.</p>
<i>ia</i>	INTEGER. Array of length $m + 1$ when <i>trans</i> = 'N' or 'n', or $n + 1$ otherwise.

This array contains indices of elements in the array a , such that $ia(i)$ is the index in the array a of the first non-zero element from the row i . The value of the last element $ia(m + 1)$ or $ia(n + 1)$ is equal to the number of non-zero elements of the matrix A plus one. Refer to *rowIndex* array description in [Sparse Matrix Storage Formats](#) for more details.

b REAL for mkl_scsrmultd.
DOUBLE PRECISION for mkl_dcsrmultd.
COMPLEX for mkl_ccsrmultd.
DOUBLE COMPLEX for mkl_zcsrmultd.

Array containing non-zero elements of the matrix B . Its length is equal to the number of non-zero elements in the matrix B . Refer to *values* array description in [Sparse Matrix Storage Formats](#) for more details.

jb INTEGER. Array containing the column indices for each non-zero element of the matrix B . For each row the column indices must be arranged in the increasing order.

The length of this array is equal to the length of the array b . Refer to *columns* array description in [Sparse Matrix Storage Formats](#) for more details.

ib INTEGER. Array of length $m + 1$.

This array contains indices of elements in the array b , such that $ib(i)$ is the index in the array b of the first non-zero element from the row i . The value of the last element $ib(m + 1)$ is equal to the number of non-zero elements of the matrix B plus one. Refer to *rowIndex* array description in [Sparse Matrix Storage Formats](#) for more details.

Output Parameters

c REAL for mkl_scsrmultd.
DOUBLE PRECISION for mkl_dcsrmultd.
COMPLEX for mkl_ccsrmultd.
DOUBLE COMPLEX for mkl_zcsrmultd.

Array containing non-zero elements of the result matrix C .

ldc INTEGER. Specifies the leading dimension of the dense matrix C as declared in the calling (sub)program. Must be at least $\max(m, 1)$ when *trans* = 'N' or 'n', or $\max(1, n)$ otherwise.

Interfaces

```

Inspector-executor Sparse BLAS Routines

The inspector-executor API for Sparse BLAS divides operations into two stages: analysis and execution. During the initial analysis stage, the API inspects the matrix sparsity pattern and applies matrix structure changes. In the execution stage, subsequent routine calls reuse this information in order to improve performance.

The inspector-executor API supports key Sparse BLAS operations for iterative sparse solvers:

- Sparse matrix-vector multiplication
- Sparse matrix-matrix multiplication with a sparse or dense result
- Solution of triangular systems
- Sparse matrix addition

Naming conventions in Inspector-executor Sparse BLAS Routines

The Inspector-executor Sparse BLAS API routine names use the following convention:

```
mkl_sparse_[<character>_]<operation>[_<format>]
```

The *<character>* field indicates the data type:

s	real, single precision
c	complex, single precision
d	real, double precision
z	complex, double precision

The data type is included in the name only if the function accepts dense matrix or scalar floating point parameters.

The *<operation>* field indicates the type of operation:

<code>create</code>	create matrix handle
<code>copy</code>	create a copy of matrix handle
<code>convert</code>	convert matrix between sparse formats
<code>export</code>	export matrix from internal representation to CSR or BSR format
<code>destroy</code>	frees memory allocated for matrix handle
<code>set_<op>_hint</code>	provide information about number of upcoming compute operations and operation type for optimization purposes, where <op> is mv, sv, mm, sm, or memory
<code>optimize</code>	analyze the matrix using hints and store optimization information in matrix handle
<code>mv</code>	compute sparse matrix-vector product
<code>mm</code>	compute sparse matrix by dense matrix product (batch mv)
<code>spmm/spmmd</code>	compute sparse matrix by sparse matrix product and store the result as a sparse/dense matrix
<code>trsv</code>	solve a triangular system
<code>trsm</code>	solve a triangular system with multiple right-hand sides
<code>add</code>	compute sum of two sparse matrices

The `<format>` field indicates the sparse matrix storage format:

<code>coo</code>	coordinate format
<code>csr</code>	compressed sparse row format plus variations
<code>csc</code>	compressed sparse column format plus variations
<code>bsr</code>	block sparse row format plus variations

The format is included in the function name only if the function parameters include an explicit sparse matrix in one of the conventional sparse matrix formats.

Sparse Matrix Storage Formats for Inspector-executor Sparse BLAS Routines

Inspector-executor Sparse BLAS routines support four conventional sparse matrix storage formats:

- compressed sparse row format (CSR) plus variations
- compressed sparse column format (CSC) plus variations
- coordinate format (COO)
- block sparse row format (BSR) plus variations

Computational routines operate on a matrix handle that stores a matrix in CSR or BSR formats. Other formats should be converted to CSR or BSR format before calling any computational routines. For more information see [Sparse Matrix Storage Formats](#).

Supported Inspector-executor Sparse BLAS Operations

The Inspector-executor Sparse BLAS API can perform several operations involving sparse matrices. These notations are used in the description of the operations:

- A , G , V are sparse matrices
- B and C are dense matrices
- x and y are dense vectors
- α and β are scalars

$\text{op}(A)$ represents a possible transposition of matrix A

$$\text{op}(A) = A$$

$$\text{op}(A) = A^T \text{ - transpose of } A$$

$$\text{op}(A) = A^H \text{ - conjugate transpose of } A$$

$\text{op}(A)^{-1}$ denotes the inverse of $\text{op}(A)$.

The Inspector-executor Sparse BLAS routines support the following operations:

- computing the vector product between a sparse matrix and a dense vector:

$$y := \alpha \text{op}(A) * x + \beta y$$

- solving a single triangular system:

$$y := \alpha \text{inv}(\text{op}(A)) * x$$

- computing a product between a sparse matrix and a dense matrix:

$$C := \alpha \text{op}(A) * B + \beta C$$

- computing a product between sparse matrices with a sparse result:

$$V := \alpha \text{op}(A) * G$$

- computing a product between sparse matrices with a dense result:

$$C := \alpha \text{op}(A) * G$$

- computing a sum of sparse matrices with a sparse result:

$$V := \alpha \text{op}(A) + G$$

- solving a sparse triangular system with multiple right-hand sides:

$$C := \alpha \text{inv}(\text{op}(A)) * B$$

Matrix manipulation routines

The [Matrix Manipulation routines](#) table lists the Matrix Manipulation routines and the data types associated with them.

Matrix Manipulation Routines and Their Data Types

Routine or Function Group	Data Types	Description
mkl_sparse_?_create_csr	s, d, c, z	Creates a handle for a CSR format matrix.
mkl_sparse_?_create_csc	s, d, c, z	Creates a handle for a CSC format matrix.
mkl_sparse_?_create_coo	s, d, c, z	Creates a handle for a matrix in COO format.
mkl_sparse_?_create_bsr	s, d, c, z	Creates a handle for a matrix in BSR format.
mkl_sparse_copy	NA	Creates a copy of a matrix handle.
mkl_sparse_destroy	NA	Frees memory allocated for matrix handle.
mkl_sparse_convert_csr	NA	Converts internal matrix representation to CSR format.

Routine or Function Group	Data Types	Description
mkl_sparse_convertrt_bsr	NA	Converts internal matrix representation to BSR format or changes BSR block size.
mkl_sparse_?_export_csr	s, d, c, z	Exports CSR matrix from internal representation.
mkl_sparse_?_export_bsr	s, d, c, z	Exports BSR matrix from internal representation.
mkl_sparse_?_set_value	s, d, c, z	Changes a single value of matrix in internal representation.

[mkl_sparse_?_create_csr](#)

Creates a handle for a CSR format matrix.

Syntax

```
stat = mkl_sparse_s_create_csr (A, indexing, rows, cols, rows_start, rows_end,
col_indx, values)
```

```
stat = mkl_sparse_d_create_csr (A, indexing, rows, cols, rows_start, rows_end,
col_indx, values)
```

```
stat = mkl_sparse_c_create_csr (A, indexing, rows, cols, rows_start, rows_end,
col_indx, values)
```

```
stat = mkl_sparse_z_create_csr (A, indexing, rows, cols, rows_start, rows_end,
col_indx, values)
```

Include Files

- `mkl_spblas.f90`

Description

The `mkl_sparse_?_create_csr` routine creates a handle for an m -by- k matrix A in CSR format.

Input Parameters

<i>indexing</i>	C_INT. Indicates how input arrays are indexed. SPARSE_INDEX_BASE_Z ERO Zero-based (C-style) indexing: indices start at 0. SPARSE_INDEX_BASE_ONE NE One-based (Fortran-style) indexing: indices start at 1.
<i>rows</i>	C_INT. Number of rows of matrix A .
<i>cols</i>	C_INT. Number of columns of matrix A .
<i>rows_start</i>	C_INT.

Array of length at least m . This array contains row indices, such that $rows_start(i) - rows_start(1)$ is the first index of row i in the arrays *values* and *col_indx*.

Refer to *pointerb* array description in [CSR Format](#) for more details.

rows_end

C_INT.

Array of at least length m . This array contains row indices, such that $rows_end(i) - rows_start(1) - 1$ is the last index of row i in the arrays *values* and *col_indx*.

Refer to *pointerE* array description in [CSR Format](#) for more details.

col_indx

C_INT .

For one-based indexing, array containing the column indices plus one for each non-zero element of the matrix A . For zero-based indexing, array containing the column indices for each non-zero element of the matrix A . Its length is at least $rows_end(rows - 1) - rows_start(1)$.

values

C_FLOAT for `mkl_sparse_s_create_csr`

C_DOUBLE for `mkl_sparse_d_create_csr`

C_FLOAT_COMPLEX for `mkl_sparse_c_create_csr`

C_DOUBLE_COMPLEX for `mkl_sparse_z_create_csr`

Array containing non-zero elements of the matrix A . Its length is equal to length of the *col_indx* array.

Refer to *values* array description in [CSR Format](#) for more details.

Output Parameters

A

SPARSE_MATRIX_T.

Handle containing internal data for subsequent Inspector-executor Sparse BLAS operations.

stat

INTEGER.

Value indicating whether the operation was successful or not, and why:

SPARSE_STATUS_SUCCE The operation was successful.

SS

SPARSE_STATUS_NOT_I The routine encountered an empty handle or
INITIALIZED matrix array.

SPARSE_STATUS_ALLOC Internal memory allocation failed.
_FAILED

SPARSE_STATUS_INVAL The input parameters contain an invalid value.
ID_VALUE

SPARSE_STATUS_EXECU Execution failed.
TION_FAILED

SPARSE_STATUS_INTER An error in algorithm implementation occurred.
NAL_ERROR

SPARSE_STATUS_NOT_SUPPORTED The requested operation is not supported.

mkl_sparse_?_create_csc

Creates a handle for a CSC format matrix.

Syntax

```
stat = mkl_sparse_s_create_csc (A, indexing, rows, cols, rows_start, rows_end,
col_indx, values)
```

```
stat = mkl_sparse_d_create_csc (A, indexing, rows, cols, rows_start, rows_end,
col_indx, values)
```

```
stat = mkl_sparse_c_create_csc (A, indexing, rows, cols, rows_start, rows_end,
col_indx, values)
```

```
stat = mkl_sparse_z_create_csc (A, indexing, rows, cols, rows_start, rows_end,
col_indx, values)
```

Include Files

- mkl_spblas.f90

Description

The `mkl_sparse_?_create_csc` routine creates a handle for an m -by- k matrix A in CSC format.

Input Parameters

<i>indexing</i>	C_INT. Indicates how input arrays are indexed. SPARSE_INDEX_BASE_Z Zero-based (C-style) indexing: indices start at 0. ERO SPARSE_INDEX_BASE_O One-based (Fortran-style) indexing: indices start at 1. NE
<i>rows</i>	C_INT. Number of rows of the matrix A .
<i>cols</i>	C_INT. Number of columns of the matrix A .
<i>rows_start</i>	C_INT. Array of length at least m . This array contains row indices, such that $rows_start(i) - rows_start(1)$ is the first index of row i in the arrays <i>values</i> and <i>col_indx</i> . Refer to <i>pointerb</i> array description in CSC Format for more details.
<i>rows_end</i>	C_INT.

Array of at least length m . This array contains row indices, such that $rows_end(i) - rows_start(1) - 1$ is the last index of row i in the arrays *values* and *col_indx*.

Refer to *pointerE* array description in [CSC Format](#) for more details.

col_indx

C_INT.

For one-based indexing, array containing the column indices plus one for each non-zero element of the matrix *A*. For zero-based indexing, array containing the column indices for each non-zero element of the matrix *A*. Its length is at least $rows_end(rows - 1) - rows_start(1)$.

values

C_FLOAT for `mkl_sparse_s_create_csc`

C_DOUBLE for `mkl_sparse_d_create_csc`

C_FLOAT_COMPLEX for `mkl_sparse_c_create_csc`

C_DOUBLE_COMPLEX for `mkl_sparse_z_create_csc`

Array containing non-zero elements of the matrix *A*. Its length is equal to length of the *col_indx* array.

Refer to *values* array description in [CSC Format](#) for more details.

Output Parameters

A

SPARSE_MATRIX_T.

Handle containing internal data.

stat

INTEGER.

Value indicating whether the operation was successful or not, and why:

SPARSE_STATUS_SUCCE The operation was successful.

SS

SPARSE_STATUS_NOT_I The routine encountered an empty handle or
INITIALIZED matrix array.

SPARSE_STATUS_ALLOC Internal memory allocation failed.
_FAILED

SPARSE_STATUS_INVAL The input parameters contain an invalid value.
ID_VALUE

SPARSE_STATUS_EXECU Execution failed.
TION_FAILED

SPARSE_STATUS_INTER An error in algorithm implementation occurred.
NAL_ERROR

SPARSE_STATUS_NOT_S The requested operation is not supported.
UPPORTED

`mkl_sparse_?_create_coo`

Creates a handle for a matrix in COO format.

Syntax

```
stat = mkl_sparse_s_create_coo (A, indexing, rows, cols, nnz, row_indx, col_indx, values)
```

```
stat = mkl_sparse_d_create_coo (A, indexing, rows, cols, nnz, row_indx, col_indx, values)
```

```
stat = mkl_sparse_c_create_coo (A, indexing, rows, cols, nnz, row_indx, col_indx, values)
```

```
stat = mkl_sparse_z_create_coo (A, indexing, rows, cols, nnz, row_indx, col_indx, values)
```

Include Files

- `mkl_spblas.f90`

Description

The `mkl_sparse_?_create_coo` routine creates a handle for an m -by- k matrix A in COO format.

Input Parameters

<i>indexing</i>	C_INT. Indicates how input arrays are indexed. SPARSE_INDEX_BASE_Z Zero-based (C-style) indexing: indices start at 0. ERO SPARSE_INDEX_BASE_O One-based (Fortran-style) indexing: indices start at 1. NE
<i>rows</i>	C_INT. Number of rows of matrix A .
<i>cols</i>	C_INT. Number of columns of matrix A .
<i>nnz</i>	C_INT. Specifies the number of non-zero elements of the matrix A . Refer to <i>nnz</i> description in Coordinate Format for more details.
<i>row_indx</i>	C_INT. Array of length <i>nnz</i> , containing the row indices for each non-zero element of matrix A . Refer to <i>rows</i> array description in Coordinate Format for more details.
<i>col_indx</i>	C_INT. Array of length <i>nnz</i> , containing the column indices for each non-zero element of matrix A . Refer to <i>columns</i> array description in Coordinate Format for more details.
<i>values</i>	C_FLOAT for <code>mkl_sparse_s_create_coo</code>

C_DOUBLE for mkl_sparse_d_create_coo

C_FLOAT_COMPLEX for mkl_sparse_c_create_coo

C_DOUBLE_COMPLEX for mkl_sparse_z_create_coo

Array of length *nnz*, containing the non-zero elements of matrix *A* in arbitrary order.

Refer to *values* array description in [Coordinate Format](#) for more details.

Output Parameters

A

SPARSE_MATRIX_T.

Handle containing internal data.

stat

INTEGER.

Value indicating whether the operation was successful or not, and why:

SPARSE_STATUS_SUCCESS The operation was successful.
SS

SPARSE_STATUS_NOT_INITIALIZED The routine encountered an empty handle or matrix array.

SPARSE_STATUS_ALLOC_FAILED Internal memory allocation failed.

SPARSE_STATUS_INVALID_VALUE The input parameters contain an invalid value.

SPARSE_STATUS_EXECUTION_FAILED Execution failed.

SPARSE_STATUS_INTERNAL_ERROR An error in algorithm implementation occurred.

SPARSE_STATUS_NOT_SUPPORTED The requested operation is not supported.

mkl_sparse_?_create_bsr

Creates a handle for a matrix in BSR format.

Syntax

```
stat = mkl_sparse_s_create_bsr (A, indexing, block_layout, rows, cols, block_size,
rows_start, rows_end, col_indx, values)
```

```
stat = mkl_sparse_d_create_bsr (A, indexing, block_layout, rows, cols, block_size,
rows_start, rows_end, col_indx, values)
```

```
stat = mkl_sparse_c_create_bsr (A, indexing, block_layout, rows, cols, block_size,
rows_start, rows_end, col_indx, values)
```

```
stat = mkl_sparse_z_create_bsr (A, indexing, block_layout, rows, cols, block_size,
rows_start, rows_end, col_indx, values)
```

Include Files

- `mkl_spblas.f90`

Description

The `mkl_sparse_?_create_bsr` routine creates a handle for an m -by- k matrix A in BSR format.

Input Parameters

<i>indexing</i>	C_INT. Indicates how input arrays are indexed. SPARSE_INDEX_BASE_Z ERO Zero-based (C-style) indexing: indices start at 0. SPARSE_INDEX_BASE_O NE One-based (Fortran-style) indexing: indices start at 1.
<i>block_layout</i>	C_INT. Specifies layout of blocks: SPARSE_LAYOUT_ROW_M AJOR Storage of elements of blocks uses row major layout. SPARSE_LAYOUT_COLUMN N_MAJOR Storage of elements of blocks uses column major layout.
<i>rows</i>	C_INT. Number of block rows of matrix A .
<i>cols</i>	C_INT. Number of block columns of matrix A .
<i>block_size</i>	C_INT. Size of blocks in matrix A .
<i>rows_start</i>	C_INT. Array of length m . This array contains row indices, such that $rows_start(i) - rows_start(1)$ is the first index of block row i in the arrays <i>values</i> and <i>col_indx</i> . Refer to <i>pointerb</i> array description in CSR Format for more details.
<i>rows_end</i>	C_INT. Array of length m . This array contains row indices, such that $rows_end(i) - rows_start(1) - 1$ is the last index of block row i in the arrays <i>values</i> and <i>col_indx</i> . Refer to <i>pointerE</i> array description in CSR Format for more details.
<i>col_indx</i>	C_INT.

For one-based indexing, array containing the column indices plus one for each non-zero block of the matrix *A*. For zero-based indexing, array containing the column indices for each non-zero block of the matrix *A*. Its length is `rows_end(rows - 1) - rows_start(1)`.

values

`C_FLOAT` for `mkl_sparse_s_create_bsr`
`C_DOUBLE` for `mkl_sparse_d_create_bsr`
`C_FLOAT_COMPLEX` for `mkl_sparse_c_create_bsr`
`C_DOUBLE_COMPLEX` for `mkl_sparse_z_create_bsr`

Array containing non-zero elements of the matrix *A*. Its length is equal to length of the `col_indx` array multiplied by `block_size*block_size`.

Refer to the *values* array description in [BSR Format](#) for more details.

Output Parameters

A

`SPARSE_MATRIX_T`.

Handle containing internal data.

stat

`INTEGER`.

Value indicating whether the operation was successful or not, and why:

`SPARSE_STATUS_SUCCESS` The operation was successful.
`SS`

`SPARSE_STATUS_NOT_INITIALIZED` The routine encountered an empty handle or matrix array.

`SPARSE_STATUS_ALLOC_FAILED` Internal memory allocation failed.

`SPARSE_STATUS_INVALID_VALUE` The input parameters contain an invalid value.

`SPARSE_STATUS_EXECUTION_FAILED` Execution failed.

`SPARSE_STATUS_INTERNAL_ERROR` An error in algorithm implementation occurred.

`SPARSE_STATUS_NOT_SUPPORTED` The requested operation is not supported.

mkl_sparse_copy

Creates a copy of a matrix handle.

Syntax

```
stat = mkl_sparse_copy (source, descr, dest)
```

Include Files

- `mkl_spblas.f90`

Description

The `mkl_sparse_copy` routine creates a copy of a matrix handle.

Input Parameters

<i>source</i>	SPARSE_MATRIX_T. Specifies handle containing internal data.
<i>descr</i>	MATRIX_DESCR. Descriptor specifying sparse matrix properties. <i>type</i> - Specifies the type of a sparse matrix:
	SPARSE_MATRIX_TYPE_GENERAL The matrix is processed as is.
	SPARSE_MATRIX_TYPE_SYMMETRIC The matrix is symmetric (only the requested triangle is processed).
	SPARSE_MATRIX_TYPE_HERMITIAN The matrix is Hermitian (only the requested triangle is processed).
	SPARSE_MATRIX_TYPE_TRIANGULAR The matrix is triangular (only the requested triangle is processed).
	SPARSE_MATRIX_TYPE_DIAGONAL The matrix is diagonal (only diagonal elements are processed).
	SPARSE_MATRIX_TYPE_BLOCK_TRIANGULAR The matrix is block-triangular (only requested triangle is processed). (Applies to BSR format only.)
	SPARSE_MATRIX_TYPE_BLOCK_DIAGONAL The matrix is block-diagonal (only diagonal blocks are processed. (Applies to BSR format only.)
	<i>mode</i> - Specifies the triangular matrix part for symmetric, Hermitian, triangular, and block-triangular matrices:
	SPARSE_FILL_MODE_LO_WER The lower triangular matrix part is processed.
	SPARSE_FILL_MODE_UP_PER The upper triangular matrix part is processed.
	<i>diag</i> - Specifies diagonal type for non-general matrices:
	SPARSE_DIAG_NON_UNIT Diagonal elements might not be equal to one.
	SPARSE_DIAG_UNIT Diagonal elements are equal to one.

Output Parameters

<i>dest</i>	SPARSE_MATRIX_T for <code>mkl_sparse_copy</code> Handle containing internal data.
-------------	--

`stat` INTEGER.

Value indicating whether the operation was successful or not, and why:

SPARSE_STATUS_SUCCESS The operation was successful.
SS

SPARSE_STATUS_NOT_INITIALIZED The routine encountered an empty handle or matrix array.

SPARSE_STATUS_ALLOC_FAILED Internal memory allocation failed.

SPARSE_STATUS_INVALID_VALUE The input parameters contain an invalid value.
ID_VALUE

SPARSE_STATUS_EXECUTION_FAILED Execution failed.
TION_FAILED

SPARSE_STATUS_INTERNAL_ERROR An error in algorithm implementation occurred.
NAL_ERROR

SPARSE_STATUS_NOT_SUPPORTED The requested operation is not supported.
UPPORTED

mkl_sparse_destroy

Frees memory allocated for matrix handle.

Syntax

```
stat = mkl_sparse_destroy (A)
```

Include Files

- `mkl_spblas.f90`

Description

The `mkl_sparse_destroy` routine frees memory allocated for matrix handle.

NOTE

You must free memory allocated for matrices after completing use of them. The `mkl_sparse_destroy` provides a utility to do so.

Input Parameters

`A` SPARSE_MATRIX_T.
Handle containing internal data.

Output Parameters

`stat` INTEGER.
Value indicating whether the operation was successful or not, and why:

SPARSE_STATUS_SUCCESS	The operation was successful.
SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

mkl_sparse_convert_csr

Converts internal matrix representation to CSR format.

Syntax

```
stat = mkl_sparse_convert_csr (source, operation, dest)
```

Include Files

- mkl_spblas.f90

Description

The `mkl_sparse_convert_csr` routine converts internal matrix representation to CSR format.

Input Parameters

<i>source</i>	SPARSE_MATRIX_T. Handle containing internal data.
<i>operation</i>	C_INT. Specifies operation <code>op()</code> on input matrix. SPARSE_OPERATION_NO_TRANSPOSE Non-transpose, $op(A) = A$. SPARSE_OPERATION_TRANSPOSE Transpose, $op(A) = A^T$. SPARSE_OPERATION_CONJUGATE_TRANSPOSE Conjugate transpose, $op(A) = A^H$.

Output Parameters

<i>dest</i>	SPARSE_MATRIX_T.
-------------	------------------

Handle containing internal data.

stat INTEGER.

Value indicating whether the operation was successful or not, and why:

SPARSE_STATUS_SUCCESS The operation was successful.
SS

SPARSE_STATUS_NOT_INITIALIZED The routine encountered an empty handle or matrix array.

SPARSE_STATUS_ALLOC_FAILED Internal memory allocation failed.

SPARSE_STATUS_INVALID_VALUE The input parameters contain an invalid value.
ID_VALUE

SPARSE_STATUS_EXECUTION_FAILED Execution failed.
TION_FAILED

SPARSE_STATUS_INTERNAL_ERROR An error in algorithm implementation occurred.
NAL_ERROR

SPARSE_STATUS_NOT_SUPPORTED The requested operation is not supported.
UPPORTED

mkl_sparse_convert_bsr

Converts internal matrix representation to BSR format or changes BSR block size.

Syntax

```
stat = mkl_sparse_convert_bsr (source, block_size, block_layout, operation, dest)
```

Include Files

- mkl_spblas.f90

Description

The `mkl_sparse_convert_bsr` routine converts internal matrix representation to BSR format or changes BSR block size.

Input Parameters

source SPARSE_MATRIX_T.
Handle containing internal data.

block_size C_INT.
Size of the block in the output structure.

block_layout C_INT.
Specifies layout of blocks:

SPARSE_LAYOUT_ROW_MAJOR Storage of elements of blocks uses row major layout.
AJOR

SPARSE_LAYOUT_COLUMN_MAJOR Storage of elements of blocks uses column major layout.

operation

C_INT.

Specifies operation `op()` on input matrix.

SPARSE_OPERATION_NO_TRANSPOSE Non-transpose, $op(A) = A$.

SPARSE_OPERATION_TRANSPOSE Transpose, $op(A) = A^T$.

SPARSE_OPERATION_CONJUGATE_TRANSPOSE Conjugate transpose, $op(A) = A^H$.

Output Parameters

dest

SPARSE_MATRIX_T.

Handle containing internal data.

stat

INTEGER.

Value indicating whether the operation was successful or not, and why:

SPARSE_STATUS_SUCCESS The operation was successful.

SPARSE_STATUS_NOT_INITIALIZED The routine encountered an empty handle or matrix array.

SPARSE_STATUS_ALLOC_FAILED Internal memory allocation failed.

SPARSE_STATUS_INVALID_VALUE The input parameters contain an invalid value.

SPARSE_STATUS_EXECUTION_FAILED Execution failed.

SPARSE_STATUS_INTERNAL_ERROR An error in algorithm implementation occurred.

SPARSE_STATUS_NOT_SUPPORTED The requested operation is not supported.

`mkl_sparse?_export_csr`

Exports CSR matrix from internal representation.

Syntax

```
stat = mkl_sparse_s_export_csr (source, indexing, rows, cols, rows_start, rows_end,
col_indx, values)
```

```
stat = mkl_sparse_d_export_csr (source, indexing, rows, cols, rows_start, rows_end,
col_indx, values)
```

```
stat = mkl_sparse_c_export_csr (source, indexing, rows, cols, rows_start, rows_end,
col_indx, values)
```

Include Files

- ## Description

NOTE

Input Parameters

Output Parameters

353

Refer to *pointerE* array description in [CSR Format](#) for more details.

col_indx

C_INT.

For one-based indexing, pointer to array containing the column indices plus one for each non-zero element of the matrix *source*. For zero-based indexing, pointer to array containing the column indices for each non-zero element of the matrix *source*. Its length is *rows_end(rows - 1) - rows_start(1)*.

values

C_FLOAT for *mkl_sparse_s_export_csr*

C_DOUBLE for *mkl_sparse_d_export_csr*

C_FLOAT_COMPLEX for *mkl_sparse_c_export_csr*

C_DOUBLE_COMPLEX for *mkl_sparse_z_export_csr*

Pointer to array containing non-zero elements of the matrix A. Its length is equal to length of the *col_indx* array.

Refer to *values* array description in [CSR Format](#) for more details.

Output Parameters

stat

INTEGER.

Value indicating whether the operation was successful or not, and why:

SPARSE_STATUS_SUCCE The operation was successful.

SS

SPARSE_STATUS_NOT_I The routine encountered an empty handle or
INITIALIZED matrix array.

SPARSE_STATUS_ALLOC Internal memory allocation failed.
_FAILED

SPARSE_STATUS_INVAL The input parameters contain an invalid value.
ID_VALUE

SPARSE_STATUS_EXECU Execution failed.
TION_FAILED

SPARSE_STATUS_INTER An error in algorithm implementation occurred.
NAL_ERROR

SPARSE_STATUS_NOT_S The requested operation is not supported.
UPPORTED

mkl_sparse?_export_bsr

Exports BSR matrix from internal representation.

Syntax

```
stat = mkl_sparse_s_export_bsr (source, indexing, block_layout, rows, cols,  
block_size, rows_start, rows_end, col_indx, values)
```

```
stat = mkl_sparse_d_export_bsr (source, indexing, block_layout, rows, cols,  
block_size, rows_start, rows_end, col_indx, values)
```

```
stat = mkl_sparse_c_export_bsr (source, indexing, block_layout, rows, cols,
block_size, rows_start, rows_end, col_indx, values)

stat = mkl_sparse_z_export_bsr (source, indexing, block_layout, rows, cols,
block_size, rows_start, rows_end, col_indx, values)
```

Include Files

- mkl_spblas.f90

Description

If the matrix specified by the *source* handle is in BSR format, the `mkl_sparse_?_export_bsr` routine exports an m -by- k matrix A in BSR format from the internal representation. The routine returns pointers to the internal representation and does not allocate additional memory.

NOTE

Since the exported data is a copy of an internally stored structure, any changes made to it have no effect on subsequent Inspector-executor Sparse BLAS operations.

If the matrix is not already in BSR format, the routine returns `SPARSE_STATUS_INVALID_VALUE`.

Input Parameters

source SPARSE_MATRIX_T.
Handle containing internal data.

Output Parameters

indexing C_INT.
Indicates how input arrays are indexed.

SPARSE_INDEX_BASE_Z Zero-based (C-style) indexing: indices start at 0.
ERO

SPARSE_INDEX_BASE_ONE One-based (Fortran-style) indexing: indices start at 1.
NE

block_layout C_INT.
Specifies layout of blocks:

SPARSE_LAYOUT_ROW_MAJOR Storage of elements of blocks uses row major layout.
AJOR

SPARSE_LAYOUT_COLUMN_MAJOR Storage of elements of blocks uses column major layout.
N_MAJOR

rows C_INT.
Number of block rows of the matrix *source*.

cols C_INT.
Number of columns of the matrix *source*. Number of block columns of matrix *source*.

<code>block_size</code>	C_INT. Size of the block in matrix <i>source</i> .
<code>rows_start</code>	C_INT. Pointer to array of length <i>m</i> . This array contains row indices, such that <code>rows_start(i) - rows_start(1)</code> is the first index of block row <i>i</i> in the arrays <i>values</i> and <i>col_indx</i> . Refer to <i>pointerb</i> array description in CSR Format for more details.
<code>rows_end</code>	C_INT. Pointer to array of length <i>m</i> . This array contains row indices, such that <code>rows_end(i) - rows_start(1) - 1</code> is the last index of block row <i>i</i> in the arrays <i>values</i> and <i>col_indx</i> . Refer to <i>pointerE</i> array description in CSR Format for more details.
<code>col_indx</code>	C_INT. For one-based indexing, pointer to array containing the column indices plus one for each non-zero blocks of the matrix <i>source</i> . For zero-based indexing, pointer to array containing the column indices for each non-zero blocks of the matrix <i>source</i> . Its length is <code>rows_end(m - 1) - rows_start(1)</code> .
<code>values</code>	C_FLOAT for <code>mkl_sparse_s_export_bsr</code> C_DOUBLE for <code>mkl_sparse_d_export_bsr</code> C_FLOAT_COMPLEX for <code>mkl_sparse_c_export_bsr</code> C_DOUBLE_COMPLEX for <code>mkl_sparse_z_export_bsr</code> Pointer to array containing non-zero elements of matrix <i>source</i> . Its length is equal to length of the <i>col_indx</i> array multiplied by <code>block_size*block_size</code> . Refer to the <i>values</i> array description in BSR Format for more details.

Output Parameters

<code>stat</code>	INTEGER. Value indicating whether the operation was successful or not, and why: SPARSE_STATUS_SUCCE SS The operation was successful. SPARSE_STATUS_NOT_I INITIALIZED The routine encountered an empty handle or matrix array. SPARSE_STATUS_ALLOC _FAILED Internal memory allocation failed. SPARSE_STATUS_INVAL ID_VALUE The input parameters contain an invalid value. SPARSE_STATUS_EXECU TION_FAILED Execution failed.
-------------------	--

SPARSE_STATUS_INTER_NAL_ERROR An error in algorithm implementation occurred.

SPARSE_STATUS_NOT_SUPPORTED The requested operation is not supported.

mkl_sparse_?_set_value

Changes a single value of matrix in internal representation.

Syntax

```
stat = mkl_sparse_s_set_value (A , row, col, value);
stat = mkl_sparse_d_set_value (A, row, col, value );
stat = mkl_sparse_c_set_value (A , row, col, value);
stat = mkl_sparse_z_set_value (A , row, col, value);
```

Include Files

- mkl_splblas.f90

Description

Use the `mkl_sparse_?_set_value` routine to change a single value of a matrix in internal Inspector-executor Sparse BLAS format.

Input Parameters

<code>A</code>	SPARSE_MATRIX_T. Specifies handle containing internal data.
<code>row</code>	C_INT . Indicates row of matrix in which to set value.
<code>col</code>	C_INT . Indicates column of matrix in which to set value.
<code>value</code>	C_FLOAT for <code>mkl_sparse_s_create_csr</code> C_DOUBLE for <code>mkl_sparse_d_create_csr</code> C_FLOAT_COMPLEX for <code>mkl_sparse_c_create_csr</code> C_DOUBLE_COMPLEX for <code>mkl_sparse_z_create_csr</code> Indicates value

Output Parameters

<code>A</code>	Handle containing modified internal data.
<code>stat</code>	INTEGER. Value indicating whether the operation was successful or not, and why:

SPARSE_STATUS_SUCCESS The operation was successful.
SS

SPARSE_STATUS_NOT_INITIALIZED The routine encountered an empty handle or matrix array.

SPARSE_STATUS_INVALID_ID_VALUE The input parameters contain an invalid value.

SPARSE_STATUS_INTERNAL_ERROR An error in algorithm implementation occurred.

Inspector-executor Sparse BLAS Analysis Routines

Analysis Routines and Their Data Types

Routine or Function Group	Description
mkl_sparse_set_mv_hint	Provides estimate of number and type of upcoming matrix-vector operations.
mkl_sparse_set_sv_hint	Provides estimate of number and type of upcoming triangular system solver operations.
mkl_sparse_set_mm_hint	Provides estimate of number and type of upcoming matrix-matrix multiplication operations.
mkl_sparse_set_sm_hint	Provides estimate of number and type of upcoming triangular matrix solve with multiple right hand sides operations.
mkl_sparse_set_memory_hint	Provides memory requirements for performance optimization purposes.
mkl_sparse_optimize	Analyzes matrix structure and performs optimizations using the hints provided in the handle.

Optimization Notice

Intel's compilers may or may not optimize to the same degree for non-Intel microprocessors for optimizations that are not unique to Intel microprocessors. These optimizations include SSE2, SSE3, and SSSE3 instruction sets and other optimizations. Intel does not guarantee the availability, functionality, or effectiveness of any optimization on microprocessors not manufactured by Intel. Microprocessor-dependent optimizations in this product are intended for use with Intel microprocessors. Certain optimizations not specific to Intel microarchitecture are reserved for Intel microprocessors. Notice revision #20110804

[mkl_sparse_set_mv_hint](#)

Provides estimate of number and type of upcoming matrix-vector operations.

Syntax

```
stat = mkl_sparse_set_mv_hint (A, operation, descr, expected_calls)
```

Include Files

- `mkl_splblas.f90`

Description

Use the `mkl_sparse_set_mv_hint` routine to provide the Inspector-executor Sparse BLAS API an estimate of the number of upcoming matrix-vector multiplication operations for performance optimization, and specify whether or not to perform an operation on the matrix.

Optimization Notice

Intel's compilers may or may not optimize to the same degree for non-Intel microprocessors for optimizations that are not unique to Intel microprocessors. These optimizations include SSE2, SSE3, and SSSE3 instruction sets and other optimizations. Intel does not guarantee the availability, functionality, or effectiveness of any optimization on microprocessors not manufactured by Intel. Microprocessor-dependent optimizations in this product are intended for use with Intel microprocessors. Notice revision #20110804

Input Parameters

operation

`C_INT`.

Specifies operation `op()` on input matrix.

`SPARSE_OPERATION_NO` Non-transpose, $op(A) = A$.
`N_TRANSPOSE`

`SPARSE_OPERATION_TR` Transpose, $op(A) = A^T$.
`ANSPOSE`

`SPARSE_OPERATION_CO` Conjugate transpose, $op(A) = A^H$.
`NJUGATE_TRANSPOSE`

descr

`MATRIX_DESCR`.

Descriptor specifying sparse matrix properties.

type - Specifies the type of a sparse matrix:

`SPARSE_MATRIX_TYPE_` The matrix is processed as is.
`GENERAL`

`SPARSE_MATRIX_TYPE_` The matrix is symmetric (only the requested
`SYMMETRIC` triangle is processed).

`SPARSE_MATRIX_TYPE_` The matrix is Hermitian (only the requested
`HERMITIAN` triangle is processed).

`SPARSE_MATRIX_TYPE_` The matrix is triangular (only the requested
`TRIANGULAR` triangle is processed).

`SPARSE_MATRIX_TYPE_` The matrix is diagonal (only diagonal elements
`DIAGONAL` are processed).

`SPARSE_MATRIX_TYPE_` The matrix is block-triangular (only requested
`BLOCK_TRIANGULAR` triangle is processed). (Applies to BSR format only.)

SPARSE_MATRIX_TYPE_ BLOCK_DIAGONAL The matrix is block-diagonal (only diagonal blocks are processed. (Applies to BSR format only.)

mode - Specifies the triangular matrix part for symmetric, Hermitian, triangular, and block-triangular matrices:

SPARSE_FILL_MODE_LO WER The lower triangular matrix part is processed.

SPARSE_FILL_MODE_UP PER The upper triangular matrix part is processed.

diag - Specifies diagonal type for non-general matrices:

SPARSE_DIAG_NON_UNIT Diagonal elements might not be equal to one.

SPARSE_DIAG_UNIT Diagonal elements are equal to one.

expected_calls

C_INT.

Number of expected calls to execution routine.

Output Parameters

A

SPARSE_MATRIX_T.

Handle containing internal data.

stat

INTEGER.

Value indicating whether the operation was successful or not, and why:

SPARSE_STATUS_SUCCESS The operation was successful.

SPARSE_STATUS_NOT_INITIALIZED The routine encountered an empty handle or matrix array.

SPARSE_STATUS_ALLOC_FAILED Internal memory allocation failed.

SPARSE_STATUS_INVALID_VALUE The input parameters contain an invalid value.

SPARSE_STATUS_EXECUTION_FAILED Execution failed.

SPARSE_STATUS_INTERNAL_ERROR An error in algorithm implementation occurred.

SPARSE_STATUS_NOT_SUPPORTED The requested operation is not supported.

mkl_sparse_set_sv_hint

Provides estimate of number and type of upcoming triangular system solver operations.

Syntax

```
stat = mkl_sparse_set_sv_hint (A, operation, descr, expected_calls)
```

Include Files

- mkl_spblas.f90

Description

The `mkl_sparse_sv_hint` routine provides an estimate of the number of upcoming triangular system solver operations and type of these operations for performance optimization.

Optimization Notice

Intel's compilers may or may not optimize to the same degree for non-Intel microprocessors for optimizations that are not unique to Intel microprocessors. These optimizations include SSE2, SSE3, and SSSE3 instruction sets and other optimizations. Intel does not guarantee the availability, functionality, or effectiveness of any optimization on microprocessors not manufactured by Intel. Microprocessor-dependent optimizations in this product are intended for use with Intel microprocessors. Notice revision #20110804

Input Parameters

<i>operation</i>	C_INT. Specifies operation <code>op()</code> on input matrix. SPARSE_OPERATION_NO Non-transpose, $op(A) = A$. N_TRANSPOSE SPARSE_OPERATION_TR Transpose, $op(A) = A^T$. ANSPOSE SPARSE_OPERATION_CO Conjugate transpose, $op(A) = A^H$. NJUGATE_TRANSPOSE
<i>descr</i>	MATRIX_DESCR. Descriptor specifying sparse matrix properties. <i>type</i> - Specifies the type of a sparse matrix: SPARSE_MATRIX_TYPE_ The matrix is processed as is. GENERAL SPARSE_MATRIX_TYPE_ The matrix is symmetric (only the requested SYMMETRIC triangle is processed). SPARSE_MATRIX_TYPE_ The matrix is Hermitian (only the requested HERMITIAN triangle is processed). SPARSE_MATRIX_TYPE_ The matrix is triangular (only the requested TRIANGULAR triangle is processed). SPARSE_MATRIX_TYPE_ The matrix is diagonal (only diagonal elements DIAGONAL are processed).

SPARSE_MATRIX_TYPE_BLOCK_TRIANGULAR The matrix is block-triangular (only requested triangle is processed). (Applies to BSR format only.)

SPARSE_MATRIX_TYPE_BLOCK_DIAGONAL The matrix is block-diagonal (only diagonal blocks are processed). (Applies to BSR format only.)

mode - Specifies the triangular matrix part for symmetric, Hermitian, triangular, and block-triangular matrices:

SPARSE_FILL_MODE_LOWER The lower triangular matrix part is processed.

SPARSE_FILL_MODE_UPPER The upper triangular matrix part is processed.

diag - Specifies diagonal type for non-general matrices:

SPARSE_DIAG_NON_UNIT Diagonal elements might not be equal to one.

SPARSE_DIAG_UNIT Diagonal elements are equal to one.

expected_calls

C_INT.

Number of expected calls to execution routine.

Output Parameters

A

SPARSE_MATRIX_T.

Handle containing internal data.

stat

INTEGER.

Value indicating whether the operation was successful or not, and why:

SPARSE_STATUS_SUCCESS The operation was successful.

SPARSE_STATUS_NOT_INITIALIZED The routine encountered an empty handle or matrix array.

SPARSE_STATUS_ALLOC_FAILED Internal memory allocation failed.

SPARSE_STATUS_INVALID_ID_VALUE The input parameters contain an invalid value.

SPARSE_STATUS_EXECUTION_FAILED Execution failed.

SPARSE_STATUS_INTERNAL_ERROR An error in algorithm implementation occurred.

SPARSE_STATUS_NOT_SUPPORTED The requested operation is not supported.

mkl_sparse_set_mm_hint

Provides estimate of number and type of upcoming matrix-matrix multiplication operations.

Syntax

`stat = mkl_sparse_set_mm_hint (A, operation, descr, layout, dense_matrix_size, expected_calls)`

Include Files

- `mkl_spblas.f90`

Description

The `mkl_sparse_set_mm_hint` routine provides an estimate of the number of upcoming matrix-matrix multiplication operations and type of these operations for performance optimization purposes.

Optimization Notice

Intel's compilers may or may not optimize to the same degree for non-Intel microprocessors for optimizations that are not unique to Intel microprocessors. These optimizations include SSE2, SSE3, and SSSE3 instruction sets and other optimizations. Intel does not guarantee the availability, functionality, or effectiveness of any optimization on microprocessors not manufactured by Intel. Notice revision #20110804

Input Parameters

<i>operation</i>	<code>C_INT</code> . Specifies operation <code>op()</code> on input matrix. <code>SPARSE_OPERATION_NO</code> Non-transpose, $op(A) = A$. <code>N_TRANSPOSE</code> <code>SPARSE_OPERATION_TR</code> Transpose, $op(A) = A^T$. <code>ANSPOSE</code> <code>SPARSE_OPERATION_CO</code> Conjugate transpose, $op(A) = A^H$. <code>NJUGATE_TRANSPOSE</code>
<i>descr</i>	<code>MATRIX_DESCR</code> . Descriptor specifying sparse matrix properties. <i>type</i> - Specifies the type of a sparse matrix: <code>SPARSE_MATRIX_TYPE_GENERAL</code> The matrix is processed as is. <code>SPARSE_MATRIX_TYPE_SYMMETRIC</code> The matrix is symmetric (only the requested triangle is processed). <code>SPARSE_MATRIX_TYPE_HERMITIAN</code> The matrix is Hermitian (only the requested triangle is processed).

SPARSE_MATRIX_TYPE_ TRIANGULAR	The matrix is triangular (only the requested triangle is processed).
SPARSE_MATRIX_TYPE_ DIAGONAL	The matrix is diagonal (only diagonal elements are processed).
SPARSE_MATRIX_TYPE_ BLOCK_TRIANGULAR	The matrix is block-triangular (only requested triangle is processed). (Applies to BSR format only.)
SPARSE_MATRIX_TYPE_ BLOCK_DIAGONAL	The matrix is block-diagonal (only diagonal blocks are processed). (Applies to BSR format only.)

mode - Specifies the triangular matrix part for symmetric, Hermitian, triangular, and block-triangular matrices:

SPARSE_FILL_MODE_LO WER	The lower triangular matrix part is processed.
SPARSE_FILL_MODE_UP PER	The upper triangular matrix part is processed.

diag - Specifies diagonal type for non-general matrices:

SPARSE_DIAG_NON_UNI T	Diagonal elements might not be equal to one.
SPARSE_DIAG_UNIT	Diagonal elements are equal to one.

layout

C_INT.

Specifies layout of elements:

SPARSE_LAYOUT_COLUM N_MAJOR	Storage of elements uses column major layout.
SPARSE_LAYOUT_ROW_M AJOR	Storage of elements uses row major layout.

dense_matrix_size

C_INT.

Number of columns in dense matrix.

expected_calls

C_INT.

Number of expected calls to execution routine.

Output Parameters

A

SPARSE_MATRIX_T.

Handle containing internal data.

stat

INTEGER.

Value indicating whether the operation was successful or not, and why:

SPARSE_STATUS_SUCCE SS	The operation was successful.
---------------------------	-------------------------------

SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

mkl_sparse_set_sm_hint

Provides estimate of number and type of upcoming triangular matrix solve with multiple right hand sides operations.

Syntax

```
stat = mkl_sparse_set_sm_hint (A, operation, descr, layout, dense_matrix_size,
expected calls)
```

Include Files

- mkl spblas.f90

Description

The `mk1_sparse_set_sm_hint` routine provides an estimate of the number of upcoming triangular matrix solve with multiple right hand sides operations and type of these operations for performance optimization purposes.

Optimization Notice

Intel's compilers may or may not optimize to the same degree for non-Intel microprocessors for optimizations that are not unique to Intel microprocessors. These optimizations include SSE2, SSE3, and SSSE3 instruction sets and other optimizations. Intel does not guarantee the availability, functionality, or effectiveness of any optimization on microprocessors not manufactured by Intel. Microprocessor-dependent optimizations in this product are intended for use with Intel microprocessors. Certain optimizations not specific to Intel microarchitecture are reserved for Intel microprocessors. Please refer to the applicable product User and Reference Guides for more information regarding the specific instruction sets covered by this notice.

Notice revision #20110804

Input Parameters

operation C_INT.
Specifies operation `op()` on input matrix.

SPARSE_OPERATION_NO Non-transpose, $\text{op}(A) = A$.
N_TRANSPOSE

SPARSE_OPERATION_TR Transpose, $\text{op}(A) = A^T$.
ANSPOSE

SPARSE_OPERATION_CO Conjugate transpose, $\text{op}(A) = A^H$.
NJUGATE_TRANSPOSE

descr

MATRIX_DESCR.

Descriptor specifying sparse matrix properties.

type - Specifies the type of a sparse matrix:

SPARSE_MATRIX_TYPE_ The matrix is processed as is.
GENERAL

SPARSE_MATRIX_TYPE_ The matrix is symmetric (only the requested
SYMMETRIC triangle is processed).

SPARSE_MATRIX_TYPE_ The matrix is Hermitian (only the requested
HERMITIAN triangle is processed).

SPARSE_MATRIX_TYPE_ The matrix is triangular (only the requested
TRIANGULAR triangle is processed).

SPARSE_MATRIX_TYPE_ The matrix is diagonal (only diagonal elements
DIAGONAL are processed).

SPARSE_MATRIX_TYPE_ The matrix is block-triangular (only requested
BLOCK_TRIANGULAR triangle is processed). (Applies to BSR format only.)

SPARSE_MATRIX_TYPE_ The matrix is block-diagonal (only diagonal
BLOCK_DIAGONAL blocks are processed). (Applies to BSR format only.)

mode - Specifies the triangular matrix part for symmetric, Hermitian, triangular, and block-triangular matrices:

SPARSE_FILL_MODE_LO The lower triangular matrix part is processed.
WER

SPARSE_FILL_MODE_UP The upper triangular matrix part is processed.
PER

diag - Specifies diagonal type for non-general matrices:

SPARSE_DIAG_NON_UNI Diagonal elements might not be equal to one.
T

SPARSE_DIAG_UNIT Diagonal elements are equal to one.

layout

C_INT.

Specifies layout of elements:

SPARSE_LAYOUT_COLUM Storage of elements uses column major layout.
N_MAJOR

	SPARSE_LAYOUT_ROW_M	Storage of elements uses row major layout.
	AJOR	
<code>dense_matrix_size</code>	C_INT.	
		Number of right-hand-side.
<code>expected_calls</code>	C_INT.	
		Number of expected calls to execution routine.

Output Parameters

<code>A</code>	SPARSE_MATRIX_T.	
		Handle containing internal data.
<code>stat</code>	INTEGER.	
		Value indicating whether the operation was successful or not, and why:
	SPARSE_STATUS_SUCCESS	The operation was successful.
	SS	
	SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
	SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
	SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
	SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
	SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
	SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

mkl_sparse_set_memory_hint

Provides memory requirements for performance optimization purposes.

Syntax

```
stat = mkl_sparse_set_memory_hint (A, policy)
```

Include Files

- `mkl_spblas.f90`

Description

The `mkl_sparse_set_memory_hint` routine allocates additional memory for further performance optimization purposes.

Optimization Notice

Intel's compilers may or may not optimize to the same degree for non-Intel microprocessors for optimizations that are not unique to Intel microprocessors. These optimizations include SSE2, SSE3, and SSSE3 instruction sets and other optimizations. Intel does not guarantee the availability, functionality, or effectiveness of any optimization on microprocessors not manufactured by Intel. Microprocessor-dependent optimizations in this product are intended for use with Intel microprocessors. Certain optimizations not specific to Intel microarchitecture are reserved for Intel microprocessors. Please refer to the applicable product User and Reference Guides for more information regarding the specific instruction sets covered by this notice.

Notice revision #20110804

Input Parameters

policy

C_INT.

Specify memory utilization policy for optimization routine using these types:

SPARSE_MEMORY_NONE Routine can allocate memory only for auxiliary structures (such as for workload balancing); the amount of memory is proportional to vector size.

SPARSE_MEMORY_AGGRESSIVE Default.
Routine can allocate memory up to the size of matrix A for converting into the appropriate sparse format.

Output Parameters

A

SPARSE_MATRIX_T.

Handle containing internal data.

stat

INTEGER.

Value indicating whether the operation was successful or not, and why:

SPARSE_STATUS_SUCCESS The operation was successful.

SPARSE_STATUS_NOT_INITIALIZED The routine encountered an empty handle or matrix array.

SPARSE_STATUS_ALLOC_FAILED Internal memory allocation failed.

SPARSE_STATUS_INVALID_VALUE The input parameters contain an invalid value.

SPARSE_STATUS_EXECUTION_FAILED Execution failed.

SPARSE_STATUS_INTERNAL_ERROR An error in algorithm implementation occurred.

SPARSE_STATUS_NOT_SUPPORTED The requested operation is not supported.

mkl_sparse_optimize

Analyzes matrix structure and performs optimizations using the hints provided in the handle.

Syntax

stat = mkl_sparse_optimize (A)

Include Files

- mkl_splblas.f90

Description

The mkl_sparse_optimize routine analyzes matrix structure and performs optimizations using the hints provided in the handle. Generally, specifying a higher number of expected operations allows for more aggressive and time consuming optimizations.

Optimization Notice

Intel's compilers may or may not optimize to the same degree for non-Intel microprocessors for optimizations that are not unique to Intel microprocessors. These optimizations include SSE2, SSE3, and SSSE3 instruction sets and other optimizations. Intel does not guarantee the availability, functionality, or effectiveness of any optimization on microprocessors not manufactured by Intel. Microprocessor-dependent optimizations in this product are intended for use with Intel microprocessors. Certain optimizations not specific to Intel microarchitecture are reserved for Intel microprocessors. Please refer to the applicable product User and Reference Guides for more information regarding the specific instruction sets covered by this notice.

Notice revision #20110804

Input Parameters

A SPARSE_MATRIX_T.

Inspector-executor Sparse BLAS Execution Routines

Execution Routines and Their Data Types

Routine or Function Group	Data Types	Description
mkl_sparse?_mv	s, d, c, z	Computes a sparse matrix-vector product.
mkl_sparse?_trsv	s, d, c, z	Solves a system of linear equations for a square sparse matrix.
mkl_sparse?_mm	s, d, c, z	Computes the product of a sparse matrix and a dense matrix.
mkl_sparse?_trsm	s, d, c, z	Solves a system of linear equations with multiple right hand sides for a square sparse matrix.
mkl_sparse?_add	s, d, c, z	Computes sum of two sparse matrices.
mkl_sparse_spmmm	s, d, c, z	Computes the product of two sparse matrices and stores the result as a sparse matrix.
mkl_sparse?_spmmd	s, d, c, z	Computes the product of two sparse matrices and stores the result as a dense matrix.

[mkl_sparse?_mv](#)

Computes a sparse matrix-vector product.

Syntax

```
stat = mkl_sparse_s_mv (operation, alpha, A, descr, x, beta, y)
stat = mkl_sparse_d_mv (operation, alpha, A, descr, x, beta, y)
stat = mkl_sparse_c_mv (operation, alpha, A, descr, x, beta, y)
stat = mkl_sparse_z_mv (operation, alpha, A, descr, x, beta, y)
```

Include Files

- `mkl_splblas.f90`

Description

The `mkl_sparse?_mv` routine computes a sparse matrix-vector product defined as

$$y := \alpha \text{op}(A) * x + \beta y$$

where:

alpha and *beta* are scalars, *x* and *y* are vectors, and *A* is a matrix handle of a matrix with *m* rows and *k* columns.

Input Parameters

<i>operation</i>	<p>C_INT.</p> <p>Specifies operation $\text{op}()$ on input matrix.</p> <p>SPARSE_OPERATION_NO Non-transpose, $\text{op}(A) = A$. N_TRANSPOSE</p> <p>SPARSE_OPERATION_TR Transpose, $\text{op}(A) = A^T$. ANSPOSE</p> <p>SPARSE_OPERATION_CO Conjugate transpose, $\text{op}(A) = A^H$. NJUGATE_TRANSPOSE</p>
<i>alpha</i>	<p>C_FLOAT for mkl_sparse_s_mv C_DOUBLE for mkl_sparse_d_mv C_FLOAT_COMPLEX for mkl_sparse_c_mv C_DOUBLE_COMPLEX for mkl_sparse_z_mv</p> <p>Specifies the scalar <i>alpha</i>.</p>
<i>A</i>	<p>SPARSE_MATRIX_T.</p> <p>Handle containing sparse matrix in internal data structure.</p>
<i>descr</i>	<p>MATRIX_DESCR.</p> <p>Descriptor specifying sparse matrix properties.</p> <p><i>type</i> - Specifies the type of a sparse matrix:</p> <p>SPARSE_MATRIX_TYPE_ The matrix is processed as is. (Applies to BSR format only.)</p> <p><i>mode</i> - Specifies the triangular matrix part for symmetric, Hermitian, triangular, and block-triangular matrices:</p>

SPARSE_FILL_MODE_LO The lower triangular matrix part is processed.
WER

SPARSE_FILL_MODE_UP The upper triangular matrix part is processed.
PER

diag - Specifies diagonal type for non-general matrices:

SPARSE_DIAG_NON_UNI Diagonal elements might not be equal to one.
T

SPARSE_DIAG_UNIT Diagonal elements are equal to one.

x

C_FLOAT for mkl_sparse_s_mv

C_DOUBLE for mkl_sparse_d_mv

C_FLOAT_COMPLEX for mkl_sparse_c_mv

C_DOUBLE_COMPLEX for mkl_sparse_z_mv

Array with size equal to the number of columns of *A* if *operation* = SPARSE_OPERATION_NON_TRANSPOSE and at least rows of *A* otherwise. On entry, the array *x* must contain the vector *x*.

beta

C_FLOAT for mkl_sparse_s_mv

C_DOUBLE for mkl_sparse_d_mv

C_FLOAT_COMPLEX for mkl_sparse_c_mv

C_DOUBLE_COMPLEX for mkl_sparse_z_mv

Specifies the scalar *beta*.

y

C_FLOAT for mkl_sparse_s_mv

C_DOUBLE for mkl_sparse_d_mv

C_FLOAT_COMPLEX for mkl_sparse_c_mv

C_DOUBLE_COMPLEX for mkl_sparse_z_mv

Array with size at least *m* if *operation*=SPARSE_OPERATION_NON_TRANSPOSE and at least *k* otherwise. On entry, the array *y* must contain the vector *y*.

Output Parameters

y

C_FLOAT for mkl_sparse_s_mv

C_DOUBLE for mkl_sparse_d_mv

C_FLOAT_COMPLEX for mkl_sparse_c_mv

C_DOUBLE_COMPLEX for mkl_sparse_z_mv

Overwritten by the updated vector *y*.

stat

INTEGER.

Value indicating whether the operation was successful or not, and why:

SPARSE_STATUS_SUCCESS The operation was successful.
SS

SPARSE_STATUS_NOT_INITIALIZED The routine encountered an empty handle or matrix array.

SPARSE_STATUS_ALLOC_FAILED Internal memory allocation failed.

SPARSE_STATUS_INVALID_VALUE The input parameters contain an invalid value.
ID_VALUE

SPARSE_STATUS_EXECUTION_FAILED Execution failed.
TION_FAILED

SPARSE_STATUS_INTERNAL_ERROR An error in algorithm implementation occurred.
NAL_ERROR

SPARSE_STATUS_NOT_SUPPORTED The requested operation is not supported.
UPPORTED

mkl_sparse_?_trsv

Solves a system of linear equations for a triangular sparse matrix.

Syntax

```
stat = mkl_sparse_s_trsv (operation, alpha, A, descr, x, y)
stat = mkl_sparse_d_trsv (operation, alpha, A, descr, x, y)
stat = mkl_sparse_c_trsv (operation, alpha, A, descr, x, y)
stat = mkl_sparse_z_trsv (operation, alpha, A, descr, x, y)
```

Include Files

- mkl_spblas.f90

Description

The `mkl_sparse_?_trsv` routine solves a system of linear equations for a matrix:

$$\text{op}(A) * y = \alpha * x$$

where A is a triangular sparse matrix, α is a scalar, and x and y are vectors.

Input Parameters

operation

C_INT.

Specifies operation `op()` on input matrix.

SPARSE_OPERATION_NON_TRANSPOSE Non-transpose, $\text{op}(A) = A$.

SPARSE_OPERATION_TRANSPOSE Transpose, $\text{op}(A) = A^T$.

SPARSE_OPERATION_CONJUGATE_TRANSPOSE Conjugate transpose, $\text{op}(A) = A^H$.

<i>alpha</i>	<p>C_FLOAT for mkl_sparse_s_trsv</p> <p>C_DOUBLE for mkl_sparse_d_trsv</p> <p>C_FLOAT_COMPLEX for mkl_sparse_c_trsv</p> <p>C_DOUBLE_COMPLEX for mkl_sparse_z_trsv</p> <p>Specifies the scalar <i>alpha</i>.</p>

C_FLOAT_COMPLEX for mkl_sparse_c_trsv

C_DOUBLE_COMPLEX for mkl_sparse_z_trsv

Array of size at least m , where m is the number of rows of matrix A . On entry, the array x must contain the vector x .

Output Parameters

y

C_FLOAT for mkl_sparse_s_trsv

C_DOUBLE for mkl_sparse_d_trsv

C_FLOAT_COMPLEX for mkl_sparse_c_trsv

C_DOUBLE_COMPLEX for mkl_sparse_z_trsv

Array of size at least m containing the solution to the system of linear equations.

$stat$

INTEGER.

Value indicating whether the operation was successful or not, and why:

SPARSE_STATUS_SUCCE The operation was successful.
SS

SPARSE_STATUS_NOT_I The routine encountered an empty handle or
INITIALIZED matrix array.

SPARSE_STATUS_ALLOC Internal memory allocation failed.

UPPORTED

mkl_sparse_?_mm

Computes the product of a sparse matrix and a dense matrix.

Syntax

```
stat = mkl_sparse_s_mm (operation, alpha, A, descr, layout, x, columns, ldx, beta, y, ldy)
```

```
stat = mkl_sparse_d_mm (operation, alpha, A, descr, layout, x, columns, ldx, beta, y, ldy)
```

```
stat = mkl_sparse_c_mm (operation, alpha, A, descr, layout, x, columns, ldx, beta, y, ldy)
```

```
stat = mkl_sparse_z_mm (operation, alpha, A, descr, layout, x, columns, ldx, beta, y, ldy)
```

Include Files

- `mkl_splblas.f90`

Description

The `mkl_sparse_?_mm` routine performs a matrix-matrix operation:

```
y := alpha*op(A)*x + beta*y
```

where *alpha* and *beta* are scalars, *A* and *y* are the sparse matrices, and *x* is a dense matrix.

The `mkl_sparse_?_mm` and `mkl_sparse_?_trsm` routines support these configurations:

	Column-major dense matrix: <i>layout</i> = SPARSE_LAYOUT_COLUMN_MAJ OR	Row-major dense matrix: <i>layout</i> = SPARSE_LAYOUT_ROW_MAJOR
0-based sparse matrix: SPARSE_INDEX_BASE_ZERO	CSR BSR: general non-transposed matrix multiplication only	All formats
1-based sparse matrix: SPARSE_INDEX_BASE_ONE	All formats	CSR BSR: general non-transposed matrix multiplication only

Input Parameters

operation

C_INT.

Specifies operation `op()` on input matrix.

SPARSE_OPERATION_NO Non-transpose, $op(A) = A$.
N_TRANSPOSE

SPARSE_OPERATION_TR Transpose, $op(A) = A^T$.
ANSPOSE

SPARSE_OPERATION_CO Conjugate transpose, $op(A) = A^H$.
NJUGATE_TRANSPOSE

alpha

C_FLOAT for `mkl_sparse_s_mm`

C_DOUBLE for `mkl_sparse_d_mm`

C_FLOAT_COMPLEX for `mkl_sparse_c_mm`

C_DOUBLE_COMPLEX for `mkl_sparse_z_mm`

Specifies the scalar *alpha*.

A

SPARSE_MATRIX_T.

Handle containing sparse matrix in internal data structure.

descr

MATRIX_DESCR.

Descriptor specifying sparse matrix properties.

type - Specifies the type of a sparse matrix:

SPARSE_MATRIX_TYPE_	The matrix is processed as is.
GENERAL	
SPARSE_MATRIX_TYPE_	The matrix is symmetric (only the requested
SYMMETRIC	triangle is processed).
SPARSE_MATRIX_TYPE_	The matrix is Hermitian (only the requested
HERMITIAN	triangle is processed).
SPARSE_MATRIX_TYPE_	The matrix is triangular (only the requested
TRIANGULAR	triangle is processed).
SPARSE_MATRIX_TYPE_	The matrix is diagonal (only diagonal elements
DIAGONAL	are processed).
SPARSE_MATRIX_TYPE_	The matrix is block-triangular (only requested
BLOCK_TRIANGULAR	triangle is processed). (Applies to BSR format
	only.)
SPARSE_MATRIX_TYPE_	The matrix is block-diagonal (only diagonal
BLOCK_DIAGONAL	blocks are processed). (Applies to BSR format
	only.)

mode - Specifies the triangular matrix part for symmetric, Hermitian, triangular, and block-triangular matrices:

SPARSE_FILL_MODE_LO	The lower triangular matrix part is processed.
WER	
SPARSE_FILL_MODE_UP	The upper triangular matrix part is processed.
PER	

diag - Specifies diagonal type for non-general matrices:

SPARSE_DIAG_NON_UNI	Diagonal elements might not be equal to one.
T	
SPARSE_DIAG_UNIT	Diagonal elements are equal to one.

layout

C_INT.

Describes the storage scheme for the dense matrix:

SPARSE_LAYOUT_COLUM	Storage of elements uses column major layout.
N_MAJOR	
SPARSE_LAYOUT_ROW_M	Storage of elements uses row major layout.
AJOR	

x

C_FLOAT for mkl_sparse_s_mm
 C_DOUBLE for mkl_sparse_d_mm
 C_FLOAT_COMPLEX for mkl_sparse_c_mm
 C_DOUBLE_COMPLEX for mkl_sparse_z_mm

Array of size at least *rows*cols*.

	<i>layout</i> = SPARSE_LAYOUT_COLUMN_MAJOR	<i>layout</i> = SPARSE_LAYOUT_ROW_MAJOR
<i>rows</i> (number of rows in <i>x</i>)	<i>ldx</i>	If $\text{op}(A) = A$, number of columns in <i>A</i> If $\text{op}(A) = A^T$, number of rows in <i>A</i>
<i>cols</i> (number of columns in <i>x</i>)	<i>columns</i>	<i>ldx</i>

columns

C_INT.

Number of columns of matrix *y*.

ldx

C_INT.

Specifies the leading dimension of matrix *x*.

beta

C_FLOAT for mkl_sparse_s_mm

C_DOUBLE for mkl_sparse_d_mm

C_FLOAT_COMPLEX for mkl_sparse_c_mm

C_DOUBLE_COMPLEX for mkl_sparse_z_mm

Specifies the scalar *beta*

y

C_FLOAT for mkl_sparse_s_mm

C_DOUBLE for mkl_sparse_d_mm

C_FLOAT_COMPLEX for mkl_sparse_c_mm

C_DOUBLE_COMPLEX for mkl_sparse_z_mm

Array of size at least *rows*cols*, where

	<i>layout</i> = SPARSE_LAYOUT_COLUMN_MAJOR	<i>layout</i> = SPARSE_LAYOUT_ROW_MAJOR
<i>rows</i> (number of rows in <i>y</i>)	<i>ldy</i>	If $\text{op}(A) = A$, number of columns in <i>A</i> If $\text{op}(A) = A^T$, number of rows in <i>A</i>
<i>cols</i> (number of columns in <i>y</i>)	<i>columns</i>	<i>ldy</i>

Output Parameters

y

C_FLOAT for mkl_sparse_s_mm

C_DOUBLE for mkl_sparse_d_mm

C_FLOAT_COMPLEX for mkl_sparse_c_mm

C_DOUBLE_COMPLEX for mkl_sparse_z_mm

Overwritten by the updated matrix y .

stat

INTEGER.

Value indicating whether the operation was successful or not, and why:

SPARSE_STATUS_SUCCESS The operation was successful.

SS

SPARSE_STATUS_NOT_INITIALIZED The routine encountered an empty handle or matrix array.

SPARSE_STATUS_ALLOC_FAILED Internal memory allocation failed.

SPARSE_STATUS_INVALID_VALUE The input parameters contain an invalid value.

SPARSE_STATUS_EXECUTION_FAILED Execution failed.

SPARSE_STATUS_INTERNAL_ERROR An error in algorithm implementation occurred.

SPARSE_STATUS_NOT_SUPPORTED The requested operation is not supported.

mkl_sparse_?_trsm

Solves a system of linear equations with multiple right hand sides for a triangular sparse matrix.

Syntax

```
stat = mkl_sparse_s_trsm (operation, alpha, A, descr, layout, x, columns, ldx, y, ldy)
stat = mkl_sparse_d_trsm (operation, alpha, A, descr, layout, x, columns, ldx, y, ldy)
stat = mkl_sparse_c_trsm (operation, alpha, A, descr, layout, x, columns, ldx, y, ldy)
stat = mkl_sparse_z_trsm (operation, alpha, A, descr, layout, x, columns, ldx, y, ldy)
```

Include Files

- mkl_spblas.f90

Description

The `mkl_sparse_?_trsm` routine solves a system of linear equations with multiple right hand sides for a triangular sparse matrix:

```
y := alpha*inv(op(A))*x
```

where:

α is a scalar, x and y are dense matrices, and A is a sparse matrix.

The `mkl_sparse_?_mm` and `mkl_sparse_?_trsm` routines support these configurations:

Column-major dense matrix: $layout =$ SPARSE_LAYOUT_COLUMN_MAJ OR	Row-major dense matrix: $layout =$ SPARSE_LAYOUT_ROW_MAJOR
--	---

0-based sparse matrix: SPARSE_INDEX_BASE_ZERO	CSR BSR: general non-transposed matrix multiplication only	All formats
1-based sparse matrix: SPARSE_INDEX_BASE_ONE	All formats	CSR BSR: general non-transposed matrix multiplication only

Input Parameters

<i>operation</i>	C_INT. Specifies operation <code>op()</code> on input matrix. SPARSE_OPERATION_NO Non-transpose, $op(A) = A$. N_TRANSPOSE SPARSE_OPERATION_TR Transpose, $op(A) = A^T$. ANSPOSE SPARSE_OPERATION_CO Conjugate transpose, $op(A) = A^H$. NJUGATE_TRANSPOSE
<i>alpha</i>	C_FLOAT for <code>mkl_sparse_s_trsm</code> C_DOUBLE for <code>mkl_sparse_d_trsm</code> C_FLOAT_COMPLEX for <code>mkl_sparse_c_trsm</code> C_DOUBLE_COMPLEX for <code>mkl_sparse_z_trsm</code> Specifies the scalar <i>alpha</i> .
<i>A</i>	SPARSE_MATRIX_T. Handle containing sparse matrix in internal data structure.
<i>descr</i>	MATRIX_DESCR. Descriptor specifying sparse matrix properties. <i>type</i> - Specifies the type of a sparse matrix: SPARSE_MATRIX_TYPE_ The matrix is processed as is. GENERAL SPARSE_MATRIX_TYPE_ The matrix is symmetric (only the requested SYMMETRIC triangle is processed). SPARSE_MATRIX_TYPE_ The matrix is Hermitian (only the requested HERMITIAN triangle is processed). SPARSE_MATRIX_TYPE_ The matrix is triangular (only the requested TRIANGULAR triangle is processed). SPARSE_MATRIX_TYPE_ The matrix is diagonal (only diagonal elements DIAGONAL are processed).

SPARSE_MATRIX_TYPE_BLOCK_TRIANGULAR The matrix is block-triangular (only requested triangle is processed). (Applies to BSR format only.)

SPARSE_MATRIX_TYPE_BLOCK_DIAGONAL The matrix is block-diagonal (only diagonal blocks are processed). (Applies to BSR format only.)

mode - Specifies the triangular matrix part for symmetric, Hermitian, triangular, and block-triangular matrices:

SPARSE_FILL_MODE_LOWER The lower triangular matrix part is processed.

SPARSE_FILL_MODE_UPPER The upper triangular matrix part is processed.

diag - Specifies diagonal type for non-general matrices:

SPARSE_DIAG_NON_UNIT Diagonal elements might not be equal to one.

SPARSE_DIAG_UNIT Diagonal elements are equal to one.

layout

C_INT.

Describes the storage scheme for the dense matrix:

SPARSE_LAYOUT_COLUMN_MAJOR Storage of elements uses column major layout.

SPARSE_LAYOUT_ROW_MAJOR Storage of elements uses row major layout.

x

C_FLOAT for mkl_sparse_s_trsm
C_DOUBLE for mkl_sparse_d_trsm
C_FLOAT_COMPLEX for mkl_sparse_c_trsm
C_DOUBLE_COMPLEX for mkl_sparse_z_trsm

Array of size at least rows*cols.

	layout = SPARSE_LAYOUT_COLUMN_MAJOR	layout = SPARSE_LAYOUT_ROW_MAJOR
rows (number of rows in x)	ldx	number of rows in A
cols (number of columns in x)	columns	ldx

On entry, the array x must contain the matrix x.

columns

C_INT.

Number of columns in matrix y.

ldx

C_INT.

Specifies the leading dimension of matrix *x*.

y

C_FLOAT for mkl_sparse_s_trsm
 C_DOUBLE for mkl_sparse_d_trsm
 C_FLOAT_COMPLEX for mkl_sparse_c_trsm
 C_DOUBLE_COMPLEX for mkl_sparse_z_trsm

Array of size at least *rows*cols*, where

	<i>layout</i> =	<i>layout</i> =
	SPARSE_LAYOUT_COLUMN_MAJOR	SPARSE_LAYOUT_ROW_MAJOR
<i>rows</i> (number of rows in <i>y</i>)	<i>ldy</i>	number of rows in A
<i>cols</i> (number of columns in <i>y</i>)	<i>columns</i>	<i>ldy</i>

Output Parameters

y

C_FLOAT for mkl_sparse_s_trsm
 C_DOUBLE for mkl_sparse_d_trsm
 C_FLOAT_COMPLEX for mkl_sparse_c_trsm
 C_DOUBLE_COMPLEX for mkl_sparse_z_trsm

Overwritten by the updated matrix *y*.

stat

INTEGER.

Value indicating whether the operation was successful or not, and why:

SPARSE_STATUS_SUCCESS The operation was successful.
 SS

SPARSE_STATUS_NOT_INITIALIZED The routine encountered an empty handle or matrix array.

SPARSE_STATUS_ALLOC_FAILED Internal memory allocation failed.

SPARSE_STATUS_INVALID_VALUE The input parameters contain an invalid value.
 ID_VALUE

SPARSE_STATUS_EXECUTION_FAILED Execution failed.
 TION_FAILED

SPARSE_STATUS_INTERNAL_ERROR An error in algorithm implementation occurred.
 NAL_ERROR

SPARSE_STATUS_NOT_SUPPORTED The requested operation is not supported.
 UPपोर्टED

mkl_sparse_?_add

Computes sum of two sparse matrices.

Syntax

```
stat = mkl_sparse_s_add (operation, A, alpha, B, C)
stat = mkl_sparse_d_add (operation, A, alpha, B, C)
stat = mkl_sparse_c_add (operation, A, alpha, B, C)
stat = mkl_sparse_z_add (operation, A, alpha, B, C)
```

Include Files

- `mkl_spblas.f90`

Description

The `mkl_sparse_?_add` routine performs a matrix-matrix operation:

```
C := alpha*op(A) + B
```

where *alpha* is a scalar and *A*, *B*, and *C* are sparse matrices.

Input Parameters

<i>A</i>	SPARSE_MATRIX_T. Handle containing a sparse matrix in internal data structure.
<i>alpha</i>	C_FLOAT for <code>mkl_sparse_s_add</code> C_DOUBLE for <code>mkl_sparse_d_add</code> C_FLOAT_COMPLEX for <code>mkl_sparse_c_add</code> C_DOUBLE_COMPLEX for <code>mkl_sparse_z_add</code> Specifies the scalar <i>alpha</i> .
<i>operation</i>	C_INT. Specifies operation <code>op()</code> on input matrix. SPARSE_OPERATION_NO Non-transpose, $\text{op}(A) = A$. N_TRANSPOSE SPARSE_OPERATION_TR Transpose, $\text{op}(A) = A^T$. ANSPOSE SPARSE_OPERATION_CO Conjugate transpose, $\text{op}(A) = A^H$. NJUGATE_TRANSPOSE
<i>B</i>	SPARSE_MATRIX_T. Handle containing a sparse matrix in internal data structure.

Output Parameters

<i>C</i>	SPARSE_MATRIX_T. Handle containing the resulting sparse matrix in internal data structure.
<i>stat</i>	INTEGER. Value indicating whether the operation was successful or not, and why:

SPARSE_STATUS_SUCCESS	The operation was successful.
SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

mkl_sparse_spmv

Computes the product of two sparse matrices and stores the result as a sparse matrix.

Syntax

```
stat = mkl_sparse_spmv (operation, A, B, C)
```

Include Files

- mkl_spmv.f90

Description

The mkl_sparse_spmv routine performs a matrix-matrix operation:

$$C := \text{op}(A) * B$$

where A , B , and C are sparse matrices.

Input Parameters

<i>operation</i>	C_INT. Specifies operation $\text{op}()$ on input matrix. SPARSE_OPERATION_NO_TRANSPOSE Non-transpose, $\text{op}(A) = A$. SPARSE_OPERATION_TRANSPOSE Transpose, $\text{op}(A) = A^T$. SPARSE_OPERATION_CONJUGATE_TRANSPOSE Conjugate transpose, $\text{op}(A) = A^H$.
<i>A</i>	SPARSE_MATRIX_T. Handle containing a sparse matrix in internal data structure.
<i>B</i>	SPARSE_MATRIX_T.

Handle containing a sparse matrix in internal data structure.

Output Parameters

<i>C</i>	SPARSE_MATRIX_T. Handle containing the resulting sparse matrix in internal data structure.
<i>stat</i>	INTEGER. Value indicating whether the operation was successful or not, and why: SPARSE_STATUS_SUCCE The operation was successful. SS SPARSE_STATUS_NOT_I The routine encountered an empty handle or INITIALIZED matrix array. SPARSE_STATUS_ALLOC Internal memory allocation failed. _FAILED SPARSE_STATUS_INVAL The input parameters contain an invalid value. ID_VALUE SPARSE_STATUS_EXECU Execution failed. TION_FAILED SPARSE_STATUS_INTER An error in algorithm implementation occurred. NAL_ERROR SPARSE_STATUS_NOT_S The requested operation is not supported. UPPORTED

mkl_sparse_?_spmmd

Computes the product of two sparse matrices and stores the result as a dense matrix.

Syntax

```
stat = mkl_sparse_s_spmmd (operation, A, B, layout, C, ldc)
stat = mkl_sparse_d_spmmd (operation, A, B, layout, C, ldc)
stat = mkl_sparse_c_spmmd (operation, A, B, layout, C, ldc)
stat = mkl_sparse_z_spmmd (operation, A, B, layout, C, ldc)
```

Include Files

- mkl_splblas.f90

Description

The `mkl_sparse_?_spmmd` routine performs a matrix-matrix operation:

```
C := op(A)*B
```

where *A* and *B* are sparse matrices and *C* is a dense matrix.

Input Parameters

<i>operation</i>	C_INT. Specifies operation $\text{op}()$ on input matrix. SPARSE_OPERATION_NO Non-transpose, $\text{op}(A) = A$. N_TRANSPOSE SPARSE_OPERATION_TR Transpose, $\text{op}(A) = A^T$. ANSPOSE SPARSE_OPERATION_CO Conjugate transpose, $\text{op}(A) = A^H$. NJUGATE_TRANSPOSE
<i>A</i>	SPARSE_MATRIX_T. Handle containing a sparse matrix in internal data structure.
<i>B</i>	SPARSE_MATRIX_T. Handle containing a sparse matrix in internal data structure.
<i>layout</i>	C_INT. Describes the storage scheme for the dense matrix: SPARSE_LAYOUT_COLUMN Storage of elements uses column major layout. N_MAJOR SPARSE_LAYOUT_ROW_M Storage of elements uses row major layout. AJOR
<i>ldC</i>	C_INT. Leading dimension of matrix C.

Output Parameters

<i>C</i>	C_FLOAT for mkl_sparse_s_spmmd C_DOUBLE for mkl_sparse_d_spmmd C_FLOAT_COMPLEX for mkl_sparse_c_spmmd C_DOUBLE_COMPLEX for mkl_sparse_z_spmmd Resulting dense matrix stored in internal data structure.
<i>stat</i>	INTEGER. Value indicating whether the operation was successful or not, and why: SPARSE_STATUS_SUCCE The operation was successful. SS SPARSE_STATUS_NOT_I The routine encountered an empty handle or INITIALIZED matrix array. SPARSE_STATUS_ALLOC Internal memory allocation failed. _FAILED

SPARSE_STATUS_INVALID_ID_VALUE The input parameters contain an invalid value.

SPARSE_STATUS_EXECUTION_FAILED Execution failed.

SPARSE_STATUS_INTERNAL_ERROR An error in algorithm implementation occurred.

SPARSE_STATUS_NOT_SUPPORTED The requested operation is not supported.

BLAS-like Extensions

Intel MKL provides C and Fortran routines to extend the functionality of the BLAS routines. These include routines to compute vector products, matrix-vector products, and matrix-matrix products.

Intel MKL also provides routines to perform certain data manipulation, including matrix in-place and out-of-place transposition operations combined with simple matrix arithmetic operations. Transposition operations are Copy As Is, Conjugate transpose, Transpose, and Conjugate. Each routine adds the possibility of scaling during the transposition operation by giving some *alpha* and/or *beta* parameters. Each routine supports both row-major orderings and column-major orderings.

Table “BLAS-like Extensions” lists these routines.

The <?> symbol in the routine short names is a precision prefix that indicates the data type:

<i>s</i>	REAL
<i>d</i>	DOUBLE PRECISION
<i>c</i>	COMPLEX
<i>z</i>	DOUBLE COMPLEX

BLAS-like Extensions

Routine	Data Types	Description
?axpby	<i>s</i> , <i>d</i> , <i>c</i> , <i>z</i>	Scales two vectors, adds them to one another and stores result in the vector (routines)
?gem2vu	<i>s</i> , <i>d</i>	Two matrix-vector products using a general matrix, real data
?gem2vc	<i>c</i> , <i>z</i>	Two matrix-vector products using a general matrix, complex data
?gemm3m	<i>c</i> , <i>z</i>	Computes a scalar-matrix-matrix product using matrix multiplications and adds the result to a scalar-matrix product.
?gemm3m_batch	<i>c</i> , <i>z</i>	Computes a scalar-matrix-matrix product using matrix multiplications and adds the result to a scalar-matrix product.
mkl_?imatcopy	<i>s</i> , <i>d</i> , <i>c</i> , <i>z</i>	Performs scaling and in-place transposition/copying of matrices.
mkl_?omatcopy	<i>s</i> , <i>d</i> , <i>c</i> , <i>z</i>	Performs scaling and out-of-place transposition/copying of matrices.

Routine	Data Types	Description
<code>mkl_?omatcopy2</code>	s, d, c, z	Performs two-strided scaling and out-of-place transposition/copying of matrices.
<code>mkl_?omatadd</code>	s, d, c, z	Performs scaling and sum of two matrices including their out-of-place transposition/copying.

?axpby

Scales two vectors, adds them to one another and stores result in the vector.

Syntax

```
call saxpby(n, a, x, incx, b, y, incy)
call daxpby(n, a, x, incx, b, y, incy)
call caxpby(n, a, x, incx, b, y, incy)
call zaxpby(n, a, x, incx, b, y, incy)
call axpby(x, y [,a] [,b])
```

Include Files

- `mkl.fi, blas.f90`

Description

The ?axpby routines perform a vector-vector operation defined as

$$y := a*x + b*y$$

where:

a and *b* are scalars

x and *y* are vectors each with *n* elements.

Input Parameters

<i>n</i>	INTEGER. Specifies the number of elements in vectors <i>x</i> and <i>y</i> .
<i>a</i>	REAL for saxpby DOUBLE PRECISION for daxpby COMPLEX for caxpby DOUBLE COMPLEX for zaxpby Specifies the scalar <i>a</i> .
<i>x</i>	REAL for saxpby DOUBLE PRECISION for daxpby COMPLEX for caxpby DOUBLE COMPLEX for zaxpby Array, size at least $(1 + (n-1)*abs(incx))$.

<i>incx</i>	INTEGER. Specifies the increment for the elements of <i>x</i> .
<i>b</i>	REAL for saxpby DOUBLE PRECISION for daxpby COMPLEX for caxpby DOUBLE COMPLEX for zaxpby Specifies the scalar <i>b</i> .
<i>y</i>	REAL for saxpby DOUBLE PRECISION for daxpby COMPLEX for caxpby DOUBLE COMPLEX for zaxpby Array, size at least $(1 + (n-1)*abs(incy))$.
<i>incy</i>	INTEGER. Specifies the increment for the elements of <i>y</i> .

Output Parameters

<i>y</i>	Contains the updated vector <i>y</i> .
----------	--

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine `axpby` interface are the following:

<i>x</i>	Holds the array of size <i>n</i> .
<i>y</i>	Holds the array of size <i>n</i> .
<i>a</i>	The default value is 1.
<i>b</i>	The default value is 1.

?gem2vu

Computes two matrix-vector products using a general matrix (real data)

Syntax

```
call sgem2vu(m, n, alpha, a, lda, x1, incx1, x2, incx2, beta, y1, incy1, y2, incy2)
call dgem2vu(m, n, alpha, a, lda, x1, incx1, x2, incx2, beta, y1, incy1, y2, incy2)
call gem2vu(a, x1, x2, y1, y2 [,alpha][,beta] )
```

Include Files

- `mk1.fi`, `blas.f90`

Description

The ?gem2vu routines perform two matrix-vector operations defined as

$$y1 := \alpha * A * x1 + \beta * y1,$$

and

$$y2 := \alpha * A' * x2 + \beta * y2,$$

where:

α and β are scalars,

$x1$, $x2$, $y1$, and $y2$ are vectors,

A is an m -by- n matrix.

Input Parameters

m	INTEGER. Specifies the number of rows of the matrix A . The value of m must be at least zero.
n	INTEGER. Specifies the number of columns of the matrix A . The value of n must be at least zero.
α	REAL for sgem2vu DOUBLE PRECISION for dgem2vu Specifies the scalar α .
a	REAL for sgem2vu DOUBLE PRECISION for dgem2vu Array, size (lda, n) . Before entry, the leading m -by- n part of the array a must contain the matrix of coefficients.
lda	INTEGER. Specifies the leading dimension of a as declared in the calling (sub)program. The value of lda must be at least $\max(1, m)$.
$x1$	REAL for sgem2vu DOUBLE PRECISION for dgem2vu Array, size at least $(1 + (n-1) * \text{abs}(\text{incx1}))$. Before entry, the incremented array $x1$ must contain the vector $x1$.
incx1	INTEGER. Specifies the increment for the elements of $x1$. The value of incx1 must not be zero.
$x2$	REAL for sgem2vu DOUBLE PRECISION for dgem2vu Array, size at least $(1 + (m-1) * \text{abs}(\text{incx2}))$. Before entry, the incremented array $x2$ must contain the vector $x2$.
incx2	INTEGER. Specifies the increment for the elements of $x2$. The value of incx2 must not be zero.
β	REAL for sgem2vu

	DOUBLE PRECISION for dgem2vu
	Specifies the scalar <i>beta</i> . When <i>beta</i> is set to zero, then <i>y1</i> and <i>y2</i> need not be set on input.
<i>y1</i>	REAL for sgem2vu DOUBLE PRECISION for dgem2vu Array, size at least $(1 + (m-1) * \text{abs}(\text{incy1}))$. Before entry with non-zero <i>beta</i> , the incremented array <i>y1</i> must contain the vector <i>y1</i> .
<i>incy1</i>	INTEGER. Specifies the increment for the elements of <i>y1</i> . The value of <i>incy1</i> must not be zero.
<i>y</i>	REAL for sgem2vu DOUBLE PRECISION for dgem2vu Array, size at least $(1 + (n-1) * \text{abs}(\text{incy2}))$. Before entry with non-zero <i>beta</i> , the incremented array <i>y2</i> must contain the vector <i>y2</i> .
<i>incy2</i>	INTEGER. Specifies the increment for the elements of <i>y2</i> . The value of <i>incy2</i> must not be zero.

Output Parameters

<i>y1</i>	Updated vector <i>y1</i> .
<i>y2</i>	Updated vector <i>y2</i> .

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine `gem2vu` interface are the following:

<i>a</i>	Holds the matrix <i>A</i> of size (m,n) .
<i>x1</i>	Holds the vector with the number of elements <i>rx1</i> where $rx1 = n$.
<i>x2</i>	Holds the vector with the number of elements <i>rx2</i> where $rx2 = m$.
<i>y1</i>	Holds the vector with the number of elements <i>ry1</i> where $ry1 = m$.
<i>y2</i>	Holds the vector with the number of elements <i>ry2</i> where $ry2 = n$.
<i>alpha</i>	The default value is 1.
<i>beta</i>	The default value is 0.

?gem2vc

Computes two matrix-vector products using a general matrix (complex data)

Syntax

```
call cgem2vc(m, n, alpha, a, lda, x1, incx1, x2, incx2, beta, y1, incy1, y2, incy2)
call zgem2vc(m, n, alpha, a, lda, x1, incx1, x2, incx2, beta, y1, incy1, y2, incy2)
call gem2vc(a, x1, x2, y1, y2 [,alpha][,beta] )
```

Include Files

- mkl.fi, blas.f90

Description

The ?gem2vc routines perform two matrix-vector operations defined as

$$y1 := \alpha * A * x1 + \beta * y1,$$

and

$$y2 := \alpha * \text{conjg}(A') * x2 + \beta * y2,$$

where:

alpha and *beta* are scalars,

x1, *x2*, *y1*, and *y2* are vectors,

A is an *m*-by-*n* matrix.

Input Parameters

<i>m</i>	INTEGER. Specifies the number of rows of the matrix <i>A</i> . The value of <i>m</i> must be at least zero.
<i>n</i>	INTEGER. Specifies the number of columns of the matrix <i>A</i> . The value of <i>n</i> must be at least zero.
<i>alpha</i>	COMPLEX for cgem2vc DOUBLE COMPLEX for zgem2vc Specifies the scalar <i>alpha</i> .
<i>a</i>	COMPLEX for cgem2vc DOUBLE COMPLEX for zgem2vc Array, size (lda, n) . Before entry, the leading <i>m</i> -by- <i>n</i> part of the array <i>a</i> must contain the matrix of coefficients.
<i>lda</i>	INTEGER. Specifies the leading dimension of <i>a</i> as declared in the calling (sub)program. The value of <i>lda</i> must be at least $\max(1, m)$.
<i>x1</i>	COMPLEX for cgem2vc DOUBLE COMPLEX for zgem2vc Array, size at least $(1 + (n-1) * \text{abs}(\text{incx1}))$. Before entry, the incremented array <i>x1</i> must contain the vector <i>x1</i> .
<i>incx1</i>	INTEGER. Specifies the increment for the elements of <i>x1</i> . The value of <i>incx1</i> must not be zero.

<i>x2</i>	COMPLEX for <i>cgem2vc</i> DOUBLE COMPLEX for <i>zgem2vc</i> Array, size at least $(1 + (m-1) * \text{abs}(\text{incx2}))$. Before entry, the incremented array <i>x2</i> must contain the vector <i>x2</i> .
<i>incx2</i>	INTEGER. Specifies the increment for the elements of <i>x2</i> . The value of <i>incx2</i> must not be zero.
<i>beta</i>	COMPLEX for <i>cgem2vc</i> DOUBLE COMPLEX for <i>zgem2vc</i> Specifies the scalar <i>beta</i> . When <i>beta</i> is set to zero, then <i>y1</i> and <i>y2</i> need not be set on input.
<i>y1</i>	COMPLEX for <i>cgem2vc</i> DOUBLE COMPLEX for <i>zgem2vc</i> Array, size at least $(1 + (m-1) * \text{abs}(\text{incy1}))$. Before entry with non-zero <i>beta</i> , the incremented array <i>y1</i> must contain the vector <i>y1</i> .
<i>incy1</i>	INTEGER. Specifies the increment for the elements of <i>y1</i> . The value of <i>incy1</i> must not be zero.
<i>y2</i>	COMPLEX for <i>cgem2vc</i> DOUBLE COMPLEX for <i>zgem2vc</i> Array, size at least $(1 + (n-1) * \text{abs}(\text{incy2}))$. Before entry with non-zero <i>beta</i> , the incremented array <i>y2</i> must contain the vector <i>y2</i> .
<i>incy2</i>	INTEGER. Specifies the increment for the elements of <i>y2</i> . The value of <i>incy</i> must not be zero. INTEGER. Specifies the increment for the elements of <i>y</i> .

Output Parameters

<i>y1</i>	Updated vector <i>y1</i> .
<i>y2</i>	Updated vector <i>y2</i> .

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine *gem2vc* interface are the following:

<i>a</i>	Holds the matrix <i>A</i> of size (m,n) .
<i>x1</i>	Holds the vector with the number of elements <i>rx1</i> where $rx1 = n$.
<i>x2</i>	Holds the vector with the number of elements <i>rx2</i> where $rx2 = m$.

<i>y1</i>	Holds the vector with the number of elements <i>ry1</i> where $ry1 = m$.
<i>y2</i>	Holds the vector with the number of elements <i>ry2</i> where $ry2 = n$.
<i>alpha</i>	The default value is 1.
<i>beta</i>	The default value is 0.

?gemmt

Computes a matrix-matrix product with general matrices but updates only the upper or lower triangular part of the result matrix.

Syntax

```
call sgemmt (uplo, transa, transb, n, k, alpha, a, lda, b, ldb, beta, c, ldc)
call dgemmt (uplo, transa, transb, n, k, alpha, a, lda, b, ldb, beta, c, ldc)
call cgemmt (uplo, transa, transb, n, k, alpha, a, lda, b, ldb, beta, c, ldc)
call zgemmt (uplo, transa, transb, n, k, alpha, a, lda, b, ldb, beta, c, ldc)
call gemmt (a, b, c[, uplo] [, transa] [, transb] [, alpha] [, beta])
```

Include Files

- `mk1.fi, blas.f90`

Description

The `?gemmt` routines compute a scalar-matrix-matrix product with general matrices and add the result to the upper or lower part of a scalar-matrix product. These routines are similar to the `?gemm` routines, but they only access and update a triangular part of the square result matrix (see Application Notes below).

The operation is defined as

$$C := \alpha * \text{op}(A) * \text{op}(B) + \beta * C,$$

where:

$\text{op}(X)$ is one of $\text{op}(X) = X$, or $\text{op}(X) = X^T$, or $\text{op}(X) = X^H$,

alpha and *beta* are scalars,

A, *B* and *C* are matrices:

$\text{op}(A)$ is an *n*-by-*k* matrix,

$\text{op}(B)$ is a *k*-by-*n* matrix,

C is an *n*-by-*n* upper or lower triangular matrix.

Input Parameters

<i>uplo</i>	CHARACTER*1. Specifies whether the upper or lower triangular part of the array <i>c</i> is used. If <i>uplo</i> = 'U' or 'u', then the upper triangular part of the array <i>c</i> is used. If <i>uplo</i> = 'L' or 'l', then the lower triangular part of the array <i>c</i> is used.
<i>transa</i>	CHARACTER*1. Specifies the form of $\text{op}(A)$ used in the matrix multiplication:

	<p>if $transa = 'N'$ or $'n'$, then $op(A) = A$;</p> <p>if $transa = 'T'$ or $'t'$, then $op(A) = A^T$;</p> <p>if $transa = 'C'$ or $'c'$, then $op(A) = A^H$.</p>
<i>transb</i>	<p>CHARACTER*1. Specifies the form of $op(B)$ used in the matrix multiplication:</p> <p>if $transb = 'N'$ or $'n'$, then $op(B) = B$;</p> <p>if $transb = 'T'$ or $'t'$, then $op(B) = B^T$;</p> <p>if $transb = 'C'$ or $'c'$, then $op(B) = B^H$.</p>
<i>n</i>	<p>INTEGER. Specifies the order of the matrix C. The value of n must be at least zero.</p>
<i>k</i>	<p>INTEGER. Specifies the number of columns of the matrix $op(A)$ and the number of rows of the matrix $op(B)$. The value of k must be at least zero.</p>
<i>alpha</i>	<p>REAL for <code>sgemmt</code></p> <p>DOUBLE PRECISION for <code>dgemmt</code></p> <p>COMPLEX for <code>cgemmt</code></p> <p>DOUBLE COMPLEX for <code>zgemmt</code></p> <p>Specifies the scalar <i>alpha</i>.</p>
<i>a</i>	<p>REAL for <code>sgemmt</code></p> <p>DOUBLE PRECISION for <code>dgemmt</code></p> <p>COMPLEX for <code>cgemmt</code></p> <p>DOUBLE COMPLEX for <code>zgemmt</code></p> <p>Array, size lda by ka, where ka is k when $transa = 'N'$ or $'n'$, and is n otherwise. Before entry with $transa = 'N'$ or $'n'$, the leading n-by-k part of the array a must contain the matrix A, otherwise the leading k-by-n part of the array a must contain the matrix A.</p>
<i>lda</i>	<p>INTEGER. Specifies the leading dimension of a as declared in the calling (sub)program. When $transa = 'N'$ or $'n'$, then lda must be at least $\max(1, n)$, otherwise lda must be at least $\max(1, k)$.</p>
<i>b</i>	<p>REAL for <code>sgemmt</code></p> <p>DOUBLE PRECISION for <code>dgemmt</code></p> <p>COMPLEX for <code>cgemmt</code></p> <p>DOUBLE COMPLEX for <code>zgemmt</code></p> <p>Array, size ldb by kb, where kb is n when $transb = 'N'$ or $'n'$, and is k otherwise. Before entry with $transb = 'N'$ or $'n'$, the leading k-by-n part of the array b must contain the matrix B, otherwise the leading n-by-k part of the array b must contain the matrix B.</p>

<i>ldb</i>	INTEGER. Specifies the leading dimension of <i>b</i> as declared in the calling (sub)program. When <i>transb</i> = 'N' or 'n', then <i>ldb</i> must be at least $\max(1, k)$, otherwise <i>ldb</i> must be at least $\max(1, n)$.
<i>beta</i>	REAL for sgemmt DOUBLE PRECISION for dgemmt COMPLEX for cgemmt DOUBLE COMPLEX for zgemmt Specifies the scalar <i>beta</i> . When <i>beta</i> is equal to zero, then <i>c</i> need not be set on input.
<i>c</i>	REAL for sgemmt DOUBLE PRECISION for dgemmt COMPLEX for cgemmt DOUBLE COMPLEX for zgemmt Array, size <i>ldc</i> by <i>n</i> . Before entry with <i>uplo</i> = 'U' or 'u', the leading <i>n</i> -by- <i>n</i> upper triangular part of the array <i>c</i> must contain the upper triangular part of the matrix <i>C</i> and the strictly lower triangular part of <i>c</i> is not referenced. Before entry with <i>uplo</i> = 'L' or 'l', the leading <i>n</i> -by- <i>n</i> lower triangular part of the array <i>c</i> must contain the lower triangular part of the matrix <i>C</i> and the strictly upper triangular part of <i>c</i> is not referenced. When <i>beta</i> is equal to zero, then <i>c</i> need not be set on input.
<i>ldc</i>	INTEGER. Specifies the leading dimension of <i>c</i> as declared in the calling (sub)program. The value of <i>ldc</i> must be at least $\max(1, n)$.

Output Parameters

<i>c</i>	When <i>uplo</i> = 'U' or 'u', the upper triangular part of the array <i>c</i> is overwritten by the upper triangular part of the updated matrix. When <i>uplo</i> = 'L' or 'l', the lower triangular part of the array <i>c</i> is overwritten by the lower triangular part of the updated matrix.
----------	--

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [Fortran 95 Interface Conventions](#).

Specific details for the routine `gemmt` interface are the following:

<i>a</i>	Holds the matrix <i>A</i> of size (<i>ma</i> , <i>ka</i>) where <i>ka</i> = <i>k</i> if <i>transa</i> ='N', <i>ka</i> = <i>n</i> otherwise, <i>ma</i> = <i>n</i> if <i>transa</i> ='N', <i>ma</i> = <i>k</i> otherwise.
----------	---

<i>b</i>	Holds the matrix <i>B</i> of size (<i>mb</i> , <i>kb</i>) where $kb = n$ if <i>transb</i> = 'N', $kb = k$ otherwise, $mb = k$ if <i>transb</i> = 'N', $mb = n$ otherwise.
<i>c</i>	Holds the matrix <i>C</i> of size (<i>n</i> , <i>n</i>).
<i>uplo</i>	Must be 'U' or 'L'. The default value is 'U'.
<i>transa</i>	Must be 'N', 'C', or 'T'. The default value is 'N'.
<i>transb</i>	Must be 'N', 'C', or 'T'. The default value is 'N'.
<i>alpha</i>	The default value is 1.
<i>beta</i>	The default value is 0.

Application Notes

These routines only access and update the upper or lower triangular part of the result matrix. This can be useful when the result is known to be symmetric; for example, when computing a product of the form $C := \alpha * B * S * B^T + \beta * C$, where *S* and *C* are symmetric matrices and *B* is a general matrix. In this case, first compute $A := B * S$ (which can be done using the corresponding ?*symm* routine), then compute $C := \alpha * A * B^T + \beta * C$ using the ?*gemmt* routine.

?gemm3m

Computes a scalar-matrix-matrix product using matrix multiplications and adds the result to a scalar-matrix product.

Syntax

```
call cgemm3m(transa, transb, m, n, k, alpha, a, lda, b, ldb, beta, c, ldc)
call zgemm3m(transa, transb, m, n, k, alpha, a, lda, b, ldb, beta, c, ldc)
call gemm3m(a, b, c [,transa][,transb] [,alpha][,beta])
```

Include Files

- mkl.fi, blas.f90

Description

The ?*gemm3m* routines perform a matrix-matrix operation with general complex matrices. These routines are similar to the ?*gemm* routines, but they use fewer matrix multiplication operations (see *Application Notes* below).

The operation is defined as

$$C := \alpha * \text{op}(A) * \text{op}(B) + \beta * C,$$

where:

$\text{op}(x)$ is one of $\text{op}(x) = x$, or $\text{op}(x) = x'$, or $\text{op}(x) = \text{conjg}(x')$,

α and β are scalars,

A , B and C are matrices:

$\text{op}(A)$ is an m -by- k matrix,

$\text{op}(B)$ is a k -by- n matrix,

C is an m -by- n matrix.

Input Parameters

<i>transa</i>	<p>CHARACTER*1. Specifies the form of $\text{op}(A)$ used in the matrix multiplication:</p> <p>if <i>transa</i> = 'N' or 'n', then $\text{op}(A) = A$;</p> <p>if <i>transa</i> = 'T' or 't', then $\text{op}(A) = A'$;</p> <p>if <i>transa</i> = 'C' or 'c', then $\text{op}(A) = \text{conjg}(A')$.</p>
<i>transb</i>	<p>CHARACTER*1. Specifies the form of $\text{op}(B)$ used in the matrix multiplication:</p> <p>if <i>transb</i> = 'N' or 'n', then $\text{op}(B) = B$;</p> <p>if <i>transb</i> = 'T' or 't', then $\text{op}(B) = B'$;</p> <p>if <i>transb</i> = 'C' or 'c', then $\text{op}(B) = \text{conjg}(B')$.</p>
<i>m</i>	<p>INTEGER. Specifies the number of rows of the matrix $\text{op}(A)$ and of the matrix C. The value of <i>m</i> must be at least zero.</p>
<i>n</i>	<p>INTEGER. Specifies the number of columns of the matrix $\text{op}(B)$ and the number of columns of the matrix C.</p> <p>The value of <i>n</i> must be at least zero.</p>
<i>k</i>	<p>INTEGER. Specifies the number of columns of the matrix $\text{op}(A)$ and the number of rows of the matrix $\text{op}(B)$.</p> <p>The value of <i>k</i> must be at least zero.</p>
<i>alpha</i>	<p>COMPLEX for cgemm3m</p> <p>DOUBLE COMPLEX for zgemm3m</p> <p>Specifies the scalar <i>alpha</i>.</p>
<i>a</i>	<p>COMPLEX for cgemm3m</p> <p>DOUBLE COMPLEX for zgemm3m</p> <p>Array, size <i>lda</i> by <i>ka</i>, where <i>ka</i> is <i>k</i> when <i>transa</i> = 'N' or 'n', and is <i>m</i> otherwise. Before entry with <i>transa</i> = 'N' or 'n', the leading m-by-k part of the array <i>a</i> must contain the matrix A, otherwise the leading k-by-m part of the array <i>a</i> must contain the matrix A.</p>
<i>lda</i>	<p>INTEGER. Specifies the leading dimension of <i>a</i> as declared in the calling (sub)program.</p>

When $transa = 'N'$ or $'n'$, then lda must be at least $\max(1, m)$, otherwise lda must be at least $\max(1, k)$.

b	<p>COMPLEX for <code>cgemm3m</code></p> <p>DOUBLE COMPLEX for <code>zgemm3m</code></p> <p>Array, size ldb by kb, where kb is n when $transa = 'N'$ or $'n'$, and is k otherwise. Before entry with $transa = 'N'$ or $'n'$, the leading k-by-n part of the array b must contain the matrix B, otherwise the leading n-by-k part of the array b must contain the matrix B.</p>
ldb	<p>INTEGER. Specifies the leading dimension of b as declared in the calling (sub)program.</p> <p>When $transa = 'N'$ or $'n'$, then ldb must be at least $\max(1, k)$, otherwise ldb must be at least $\max(1, n)$.</p>
$beta$	<p>COMPLEX for <code>cgemm3m</code></p> <p>DOUBLE COMPLEX for <code>zgemm3m</code></p> <p>Specifies the scalar $beta$.</p> <p>When $beta$ is equal to zero, then c need not be set on input.</p>
c	<p>COMPLEX for <code>cgemm3m</code></p> <p>DOUBLE COMPLEX for <code>zgemm3m</code></p> <p>Array, size ldc by n. Before entry, the leading m-by-n part of the array c must contain the matrix C, except when $beta$ is equal to zero, in which case c need not be set on entry.</p>
ldc	<p>INTEGER. Specifies the leading dimension of c as declared in the calling (sub)program.</p> <p>The value of ldc must be at least $\max(1, m)$.</p>

Output Parameters

c	Overwritten by the m -by- n matrix $(\alpha * \text{op}(A) * \text{op}(B) + \beta * C)$.
-----	---

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine `gemm3m` interface are the following:

a	<p>Holds the matrix A of size (ma, ka) where</p> <p>$ka = k$ if $transa = 'N'$,</p> <p>$ka = m$ otherwise,</p> <p>$ma = m$ if $transa = 'N'$,</p> <p>$ma = k$ otherwise.</p>
b	Holds the matrix B of size (mb, kb) where

$kb = n$ if $transb = 'N'$,
 $kb = k$ otherwise,
 $mb = k$ if $transb = 'N'$,
 $mb = n$ otherwise.

c Holds the matrix *C* of size (m,n) .

transa Must be 'N', 'C', or 'T'.
The default value is 'N'.

transb Must be 'N', 'C', or 'T'.
The default value is 'N'.

alpha The default value is 1.

beta The default value is 1.

Application Notes

These routines perform a complex matrix multiplication by forming the real and imaginary parts of the input matrices. This uses three real matrix multiplications and five real matrix additions instead of the conventional four real matrix multiplications and two real matrix additions. The use of three real matrix multiplications reduces the time spent in matrix operations by 25%, resulting in significant savings in compute time for large matrices.

If the errors in the floating point calculations satisfy the following conditions:

$$fl(x \text{ op } y) = (x \text{ op } y)(1 + \delta), |\delta| \leq u, \text{ op} = *, /, fl(x \pm y) = x(1 + \alpha) \pm y(1 + \beta), |\alpha|, |\beta| \leq u$$

then for an n -by- n matrix $\hat{C} = fl(C_1 + iC_2) = fl((A_1 + iA_2)(B_1 + iB_2)) = \hat{C}_1 + i\hat{C}_2$, the following bounds are satisfied:

$$\|\hat{C}_1 - C_1\| \leq 2(n+1)u\|A\|_\infty\|B\|_\infty + O(u^2),$$

$$\|\hat{C}_2 - C_2\| \leq 4(n+4)u\|A\|_\infty\|B\|_\infty + O(u^2),$$

where $\|A\|_\infty = \max(\|A_1\|_\infty, \|A_2\|_\infty)$, and $\|B\|_\infty = \max(\|B_1\|_\infty, \|B_2\|_\infty)$.

Thus the corresponding matrix multiplications are stable.

?gemm3m_batch

Computes scalar-matrix-matrix products and adds the results to scalar matrix products for groups of general matrices.

Syntax

```
call cgemm3m_batch(transa_array, transb_array, m_array, n_array, k_array, alpha_array,
a_array, lda_array, b_array, ldb_array, beta_array, c_array, ldc_array, group_count,
group_size)
```

```
call zgemm3m_batch(transa_array, transb_array, m_array, n_array, k_array, alpha_array,
a_array, lda_array, b_array, ldb_array, beta_array, c_array, ldc_array, group_count,
group_size)
```

```
call gemm3m_batch(a_array, b_array, c_array, group_size [,transa_array][,transb_array]
[,alpha_array][,beta_array])
```

Include Files

- `mk1.fi`, `blas.f90`

Description

The `?gemm3m_batch` routines perform a series of matrix-matrix operations with general matrices. They are similar to the `?gemm3m` routine counterparts, but the `?gemm3m_batch` routines perform matrix-matrix operations with groups of matrices, processing a number of groups at once. The groups contain matrices with the same parameters. The `?gemm3m_batch` routines use fewer matrix multiplications than the `?gemm_batch` routines, as described in the *Application Notes*.

The operation is defined as

```
idx = 1
for i = 1..group_count
  alpha and beta in alpha_array(i) and beta_array(i)
  for j = 1..group_size(i)
    A, B, and C matrix in a_array(idx), b_array(idx), and c_array(idx)
    C := alpha*op(A)*op(B) + beta*C,
    idx = idx + 1
  end for
end for
```

where:

$\text{op}(X)$ is one of $\text{op}(X) = X$, or $\text{op}(X) = X^T$, or $\text{op}(X) = X^H$,

alpha and *beta* are scalar elements of *alpha_array* and *beta_array*,

A, *B* and *C* are matrices such that for *m*, *n*, and *k* which are elements of *m_array*, *n_array*, and *k_array*:

$\text{op}(A)$ is an *m*-by-*k* matrix,

$\text{op}(B)$ is a *k*-by-*n* matrix,

C is an *m*-by-*n* matrix.

A, *B*, and *C* represent matrices stored at addresses pointed to by *a_array*, *b_array*, and *c_array*, respectively. The number of entries in *a_array*, *b_array*, and *c_array* is *total_batch_count* = the sum of all the *group_size* entries.

See also [gemm](#) for a detailed description of multiplication for general matrices and [gemm_batch](#), BLAS-like extension routines for similar matrix-matrix operations.

NOTE

Error checking is not performed for Intel MKL Windows* single dynamic libraries for the `?gemm3m_batch` routines.

Input Parameters

transa_array

CHARACTER*1. Array of size *group_count*. For the group *i*, *transa_i* = *transa_array*(*i*) specifies the form of $\text{op}(A)$ used in the matrix multiplication:

if *transa_i* = 'N' or 'n', then $\text{op}(A) = A$;

if *transa_i* = 'T' or 't', then $\text{op}(A) = A^T$;

if *transa_i* = 'C' or 'c', then $\text{op}(A) = A^H$.

<i>transb_array</i>	<p>CHARACTER*1. Array of size <i>group_count</i>. For the group <i>i</i>, <i>transb_i</i> = <i>transb_array(i)</i> specifies the form of $\text{op}(B_i)$ used in the matrix multiplication:</p> <p>if <i>transb_i</i> = 'N' or 'n', then $\text{op}(B) = B$;</p> <p>if <i>transb_i</i> = 'T' or 't', then $\text{op}(B) = B^T$;</p> <p>if <i>transb_i</i> = 'C' or 'c', then $\text{op}(B) = B^H$.</p>
<i>m_array</i>	<p>INTEGER. Array of size <i>group_count</i>. For the group <i>i</i>, <i>m_i</i> = <i>m_array(i)</i> specifies the number of rows of the matrix $\text{op}(A)$ and of the matrix <i>C</i>.</p> <p>The value of each element of <i>m_array</i> must be at least zero.</p>
<i>n_array</i>	<p>INTEGER. Array of size <i>group_count</i>. For the group <i>i</i>, <i>n_i</i> = <i>n_array(i)</i> specifies the number of columns of the matrix $\text{op}(B)$ and the number of columns of the matrix <i>C</i>.</p> <p>The value of each element of <i>n_array</i> must be at least zero.</p>
<i>k_array</i>	<p>INTEGER. Array of size <i>group_count</i>. For the group <i>i</i>, <i>k_i</i> = <i>k_array(i)</i> specifies the number of columns of the matrix $\text{op}(A)$ and the number of rows of the matrix $\text{op}(B)$.</p> <p>The value of each element of <i>k_array</i> must be at least zero.</p>
<i>alpha_array</i>	<p>REAL for sgemm_batch</p> <p>DOUBLE PRECISION for dgemm_batch</p> <p>COMPLEX for cgemm_batch, scgemm_batch</p> <p>DOUBLE COMPLEX for zgemm_batch, dzgemm_batch</p> <p>Array of size <i>group_count</i>. For the group <i>i</i>, <i>alpha_array(i)</i> specifies the scalar <i>alpha_i</i>.</p>
<i>a_array</i>	<p>INTEGER*8 for Intel® 64 architecture</p> <p>INTEGER*4 for IA-32 architecture</p> <p>Array, size <i>total_batch_count</i>, of pointers to arrays used to store <i>A</i> matrices.</p>
<i>lda_array</i>	<p>INTEGER. Array of size <i>group_count</i>. For the group <i>i</i>, <i>lda_i</i> = <i>lda_array(i)</i> specifies the leading dimension of the array storing matrix <i>A</i> as declared in the calling (sub)program.</p> <p>When <i>transa_i</i> = 'N' or 'n', then <i>lda_i</i> must be at least $\max(1, m_i)$, otherwise <i>lda_i</i> must be at least $\max(1, k_i)$.</p>
<i>b_array</i>	<p>INTEGER*8 for Intel® 64 architecture</p> <p>INTEGER*4 for IA-32 architecture</p> <p>Array, size <i>total_batch_count</i>, of pointers to arrays used to store <i>B</i> matrices.</p>
<i>ldb_array</i>	<p>INTEGER.</p>

Array of size *group_count*. For the group *i*, $ldb_i = ldb_array(i)$ specifies the leading dimension of the array storing matrix *B* as declared in the calling (sub)program.

When $transb_i = 'N'$ or $'n'$, then ldb_i must be at least $\max(1, k_i)$, otherwise ldb_i must be at least $\max(1, n_i)$.

beta_array

REAL for sgemm_batch

DOUBLE PRECISION for dgemm_batch

COMPLEX for cgemm_batch, scgemm_batch

DOUBLE COMPLEX for zgemm_batch, dzgemm_batch

For the group *i*, *beta_array(i)* specifies the scalar *beta_i*.

When *beta_i* is equal to zero, then *C* matrices in group *i* need not be set on input.

c_array

INTEGER*8 for Intel® 64 architecture

INTEGER*4 for IA-32 architecture

Array, size *total_batch_count*, of pointers to arrays used to store *C* matrices.

ldc_array

INTEGER.

Array of size *group_count*. For the group *i*, $ldc_i = ldc_array(i)$ specifies the leading dimension of all arrays storing matrix *C* in group *i* as declared in the calling (sub)program.

ldc_i must be at least $\max(1, m_i)$.

group_count

INTEGER.

Specifies the number of groups. Must be at least 0.

group_size

INTEGER.

Array of size *group_count*. The element *group_size(i)* specifies the number of matrices in group *i*. Each element in *group_size* must be at least 0.

Output Parameters

c_array

Overwritten by the m_i -by- n_i matrix $(\alpha_i * op(A) * op(B) + \beta_i * C)$ for group *i*.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [BLAS 95 Interface Conventions](#).

Specific details for the routine `gemm3m_batch` interface are the following:

a_array

Holds the matrix *A* of size (ma, ka) where

$ka = k$ if $transa = 'N'$,

$ka = m$ otherwise,

	$ma = m$ if $transa='N'$, $ma = k$ otherwise.
<i>b_array</i>	Holds the matrix <i>B</i> of size (mb, kb) where $kb = n$ if $transb_array = 'N'$, $kb = k$ otherwise, $mb = k$ if $transb_array = 'N'$, $mb = n$ otherwise.
<i>c_array</i>	Holds the matrix <i>C</i> of size (m, n) .
<i>transa_array</i>	Must be 'N', 'C', or 'T'. The default value is 'N'.
<i>transb_array</i>	Must be 'N', 'C', or 'T'. The default value is 'N'.
<i>alpha_array</i>	The default value is 1.
<i>beta_array</i>	The default value is 0.

Application Notes

These routines perform a complex matrix multiplication by forming the real and imaginary parts of the input matrices. This uses three real matrix multiplications and five real matrix additions instead of the conventional four real matrix multiplications and two real matrix additions. The use of three real matrix multiplications reduces the time spent in matrix operations by 25%, resulting in significant savings in compute time for large matrices.

If the errors in the floating point calculations satisfy the following conditions:

$$fl(x \text{ op } y) = (x \text{ op } y) (1 + \delta), |\delta| \leq u, \text{ op} = *, /, \quad fl(x \pm y) = x(1 + \alpha) \pm y(1 + \beta), \quad |\alpha|, |\beta| \leq u$$

then for an n -by- n matrix $\hat{C} = fl(C_1 + iC_2) = fl((A_1 + iA_2)(B_1 + iB_2)) = \hat{C}_1 + i\hat{C}_2$, the following bounds are satisfied:

$$\|\hat{C}_1 - C_1\| \leq 2(n+1)u\|A\|_\infty\|B\|_\infty + O(u^2),$$

$$\|\hat{C}_2 - C_2\| \leq 4(n+4)u\|A\|_\infty\|B\|_\infty + O(u^2),$$

where $\|A\|_\infty = \max(\|A_1\|_\infty, \|A_2\|_\infty)$, and $\|B\|_\infty = \max(\|B_1\|_\infty, \|B_2\|_\infty)$.

Thus the corresponding matrix multiplications are stable.

mkl_?imatcopy

Performs scaling and in-place transposition/copying of matrices.

Syntax

```
call mkl_simatcopy(ordering, trans, rows, cols, alpha, ab, lda, ldb)
call mkl_dimatcopy(ordering, trans, rows, cols, alpha, ab, lda, ldb)
call mkl_cimatcopy(ordering, trans, rows, cols, alpha, ab, lda, ldb)
call mkl_zimatcopy(ordering, trans, rows, cols, alpha, ab, lda, ldb)
```

Include Files

- `mkl.fi`

Description

The `mkl_?imatcopy` routine performs scaling and in-place transposition/copying of matrices. A transposition operation can be a normal matrix copy, a transposition, a conjugate transposition, or just a conjugation. The operation is defined as follows:

$$AB := \alpha * \text{op}(AB).$$

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section "**Interfaces**" below.

NOTE

Different arrays must not overlap.

Input Parameters

<i>ordering</i>	<p>CHARACTER*1. Ordering of the matrix storage.</p> <p>If <i>ordering</i> = 'R' or 'r', the ordering is row-major.</p> <p>If <i>ordering</i> = 'C' or 'c', the ordering is column-major.</p>
<i>trans</i>	<p>CHARACTER*1. Parameter that specifies the operation type.</p> <p>If <i>trans</i> = 'N' or 'n', $\text{op}(AB) = AB$ and the matrix <i>AB</i> is assumed unchanged on input.</p> <p>If <i>trans</i> = 'T' or 't', it is assumed that <i>AB</i> should be transposed.</p> <p>If <i>trans</i> = 'C' or 'c', it is assumed that <i>AB</i> should be conjugate transposed.</p> <p>If <i>trans</i> = 'R' or 'r', it is assumed that <i>AB</i> should be only conjugated.</p> <p>If the data is real, then <i>trans</i> = 'R' is the same as <i>trans</i> = 'N', and <i>trans</i> = 'C' is the same as <i>trans</i> = 'T'.</p>
<i>rows</i>	INTEGER. The number of rows in matrix <i>AB</i> before the transpose operation.
<i>cols</i>	INTEGER. The number of columns in matrix <i>AB</i> before the transpose operation.
<i>ab</i>	<p>REAL for <code>mkl_simatcopy</code>.</p> <p>DOUBLE PRECISION for <code>mkl_dimatcopy</code>.</p> <p>COMPLEX for <code>mkl_cimatcopy</code>.</p> <p>DOUBLE COMPLEX for <code>mkl_zimatcopy</code>.</p> <p>Array, size <i>ab</i>(<i>lda</i>, *).</p>
<i>alpha</i>	<p>REAL for <code>mkl_simatcopy</code>.</p> <p>DOUBLE PRECISION for <code>mkl_dimatcopy</code>.</p> <p>COMPLEX for <code>mkl_cimatcopy</code>.</p>

DOUBLE COMPLEX for mkl_zimatcopy.

This parameter scales the input matrix by *alpha*.

lda

INTEGER. Distance between the first elements in adjacent columns (in the case of the column-major order) or rows (in the case of the row-major order) in the source matrix; measured in the number of elements.

This parameter must be at least *rows* if *ordering* = 'C' or 'c', and $\max(1, cols)$ otherwise.

ldb

INTEGER. Distance between the first elements in adjacent columns (in the case of the column-major order) or rows (in the case of the row-major order) in the destination matrix; measured in the number of elements.

To determine the minimum value of *ldb* on output, consider the following guideline:

If *ordering* = 'C' or 'c', then

- If *trans* = 'T' or 't' or 'C' or 'c', this parameter must be at least $\max(1, cols)$
- If *trans* = 'N' or 'n' or 'R' or 'r', this parameter must be at least $\max(1, rows)$

If *ordering* = 'R' or 'r', then

- If *trans* = 'T' or 't' or 'C' or 'c', this parameter must be at least $\max(1, rows)$
- If *trans* = 'N' or 'n' or 'R' or 'r', this parameter must be at least $\max(1, cols)$

Output Parameters

ab

REAL for mkl_simatcopy.

DOUBLE PRECISION for mkl_dimatcopy.

COMPLEX for mkl_cimatcopy.

DOUBLE COMPLEX for mkl_zimatcopy.

Array, size *ab(ldb,*)*.

Contains the matrix *AB*.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_simatcopy ( ordering, trans, rows, cols, alpha, ab, lda, ldb )
  CHARACTER*1 ordering, trans
  INTEGER rows, cols, src_ld, dst_ld
  REAL ab(*), alpha*
```

```
SUBROUTINE mkl_dimatcopy ( ordering, trans, rows, cols, alpha, ab, lda, ldb )
  CHARACTER*1 ordering, trans
  INTEGER rows, cols, src_ld, dst_ld
  DOUBLE PRECISION ab(*), alpha*
```

```

SUBROUTINE mkl_cimatcopy ( ordering, trans, rows, cols, alpha, ab, lda, ldb )
  CHARACTER*1 ordering, trans
  INTEGER rows, cols, src_ld, dst_ld
  COMPLEX ab(*), alpha*

```

```

SUBROUTINE mkl_zimatcopy ( ordering, trans, rows, cols, alpha, ab, lda, ldb )
  CHARACTER*1 ordering, trans
  INTEGER rows, cols, src_ld, dst_ld
  DOUBLE COMPLEX ab(*), alpha*

```

mkl_?omatcopy

Performs scaling and out-place transposition/copying of matrices.

Syntax

```

call mkl_somatcopy(ordering, trans, rows, cols, alpha, a, lda, b, ldb)
call mkl_domatcopy(ordering, trans, rows, cols, alpha, a, lda, b, ldb)
call mkl_comatcopy(ordering, trans, rows, cols, alpha, a, lda, b, ldb)
call mkl_zomatcopy(ordering, trans, rows, cols, alpha, a, lda, b, ldb)

```

Include Files

- mkl.fi

Description

The `mkl_?omatcopy` routine performs scaling and out-of-place transposition/copying of matrices. A transposition operation can be a normal matrix copy, a transposition, a conjugate transposition, or just a conjugation. The operation is defined as follows:

$$B := \alpha * \text{op}(A)$$

The routine parameter descriptions are common for all implemented interfaces with the exception of data types that mostly refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section "**Interfaces**" below.

NOTE

Different arrays must not overlap.

Input Parameters

<i>ordering</i>	CHARACTER*1. Ordering of the matrix storage. If <i>ordering</i> = 'R' or 'r', the ordering is row-major. If <i>ordering</i> = 'C' or 'c', the ordering is column-major.
<i>trans</i>	CHARACTER*1. Parameter that specifies the operation type. If <i>trans</i> = 'N' or 'n', $\text{op}(A) = A$ and the matrix <i>A</i> is assumed unchanged on input. If <i>trans</i> = 'T' or 't', it is assumed that <i>A</i> should be transposed.

If *trans* = 'C' or 'c', it is assumed that *A* should be conjugate transposed.

If *trans* = 'R' or 'r', it is assumed that *A* should be only conjugated.

If the data is real, then *trans* = 'R' is the same as *trans* = 'N', and *trans* = 'C' is the same as *trans* = 'T'.

rows INTEGER. The number of rows in the source matrix.

cols INTEGER. The number of columns in the source matrix.

alpha REAL for mkl_somatcopy.

DOUBLE PRECISION for mkl_domatcopy.

COMPLEX for mkl_comatcopy.

DOUBLE COMPLEX for mkl_zomatcopy.

This parameter scales the input matrix by *alpha*.

a REAL for mkl_somatcopy.

DOUBLE PRECISION for mkl_domatcopy.

COMPLEX for mkl_comatcopy.

DOUBLE COMPLEX for mkl_zomatcopy.

Array, size *a*(*lda*, *).

lda INTEGER. (Fortran interface). Distance between the first elements in adjacent columns (in the case of the column-major order) or rows (in the case of the row-major order) in the source matrix; measured in the number of elements.

This parameter must be at least $\max(1, rows)$ if *ordering* = 'C' or 'c', and $\max(1, cols)$ otherwise.

b REAL for mkl_somatcopy.

DOUBLE PRECISION for mkl_domatcopy.

COMPLEX for mkl_comatcopy.

DOUBLE COMPLEX for mkl_zomatcopy.

Array, size *b*(*ldb*, *).

ldb INTEGER. (Fortran interface). Distance between the first elements in adjacent columns (in the case of the column-major order) or rows (in the case of the row-major order) in the destination matrix; measured in the number of elements.

To determine the minimum value of *ldb* on output, consider the following guideline:

If *ordering* = 'C' or 'c', then

- If *trans* = 'T' or 't' or 'C' or 'c', this parameter must be at least $\max(1, cols)$
- If *trans* = 'N' or 'n' or 'R' or 'r', this parameter must be at least $\max(1, rows)$

If *ordering* = 'R' or 'r', then

- If *trans* = 'T' or 't' or 'C' or 'c', this parameter must be at least $\max(1, \text{rows})$
- If *trans* = 'N' or 'n' or 'R' or 'r', this parameter must be at least $\max(1, \text{cols})$

Output Parameters

b REAL for mkl_somatcopy.
 DOUBLE PRECISION for mkl_domatcopy.
 COMPLEX for mkl_comatcopy.
 DOUBLE COMPLEX for mkl_zomatcopy.
 Array, size at least *m*.
 Contains the destination matrix.

Interfaces

mkl_?omatcopy2

Performs two-strided scaling and out-of-place transposition/copying of matrices.

Syntax

```
call mkl_somatcopy2(ordering, trans, rows, cols, alpha, a, lda, stridea, b, ldb,
  strideb)

call mkl_domatcopy2(ordering, trans, rows, cols, alpha, a, lda, stridea, b, ldb,
  strideb)

call mkl_comatcopy2(ordering, trans, rows, cols, alpha, a, lda, stridea, b, ldb,
  strideb)
```

```
call mkl_zomatcopy2(ordering, trans, rows, cols, alpha, a, lda, stridea, b, ldb,
strideb)
```

Include Files

- mkl.fi

Description

The `mkl_omatcopy2` routine performs two-strided scaling and out-of-place transposition/copying of matrices. A transposition operation can be a normal matrix copy, a transposition, a conjugate transposition, or just a conjugation. The operation is defined as follows:

$$B := \alpha * \text{op}(A)$$

Normally, matrices in the BLAS or LAPACK are specified by a single stride index. For instance, in the column-major order, $A(2,1)$ is stored in memory one element away from $A(1,1)$, but $A(1,2)$ is a leading dimension away. The leading dimension in this case is the single stride. If a matrix has two strides, then both $A(2,1)$ and $A(1,2)$ may be an arbitrary distance from $A(1,1)$.

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section "**Interfaces**" below.

NOTE

Different arrays must not overlap.

Input Parameters

<i>ordering</i>	<p>CHARACTER*1. Ordering of the matrix storage.</p> <p>If <i>ordering</i> = 'R' or 'r', the ordering is row-major.</p> <p>If <i>ordering</i> = 'C' or 'c', the ordering is column-major.</p>
<i>trans</i>	<p>CHARACTER*1. Parameter that specifies the operation type.</p> <p>If <i>trans</i> = 'N' or 'n', $\text{op}(A)=A$ and the matrix <i>A</i> is assumed unchanged on input.</p> <p>If <i>trans</i> = 'T' or 't', it is assumed that <i>A</i> should be transposed.</p> <p>If <i>trans</i> = 'C' or 'c', it is assumed that <i>A</i> should be conjugate transposed.</p> <p>If <i>trans</i> = 'R' or 'r', it is assumed that <i>A</i> should be only conjugated.</p> <p>If the data is real, then <i>trans</i> = 'R' is the same as <i>trans</i> = 'N', and <i>trans</i> = 'C' is the same as <i>trans</i> = 'T'.</p>

mkl_?omatadd

Scales and sums two matrices including in addition to performing out-of-place transposition operations.

Syntax

call mkl_somatadd(ordering, transa, transb, m, n, alpha, a, lda, beta, b, ldb, c, ldc)

call mkl_domatadd(ordering, transa, transb, m, n, alpha, a, lda, beta, b, ldb, c, ldc)

call mkl_comatadd(ordering, transa, transb, m, n, alpha, a, lda, beta, b, ldb, c, ldc)

call mkl_zomatadd(ordering, transa, transb, m, n, alpha, a, lda, beta, b, ldb, c, ldc)

Include Files

- mkl.fi

Description

The mkl_?omatadd routine scales and adds two matrices, as well as performing out-of-place transposition operations. A transposition operation can be no operation, a transposition, a conjugate transposition, or a conjugation (without transposition). The following out-of-place memory movement is done:

$C := \alpha * op(A) + \beta * op(B)$

where the $\text{op}(A)$ and $\text{op}(B)$ operations are transpose, conjugate-transpose, conjugate (no transpose), or no transpose, depending on the values of *transa* and *transb*. If no transposition of the source matrices is required, *m* is the number of rows and *n* is the number of columns in the source matrices *A* and *B*. In this case, the output matrix *C* is *m*-by-*n*.

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section "**Interfaces**" below.

NOTE

Note that different arrays must not overlap.

Input Parameters

<i>ordering</i>	<p>CHARACTER*1. Ordering of the matrix storage.</p> <p>If <i>ordering</i> = 'R' or 'r', the ordering is row-major.</p> <p>If <i>ordering</i> = 'C' or 'c', the ordering is column-major.</p>
<i>transa</i>	<p>CHARACTER*1. Parameter that specifies the operation type on matrix <i>A</i>.</p> <p>If <i>transa</i> = 'N' or 'n', $\text{op}(A)=A$ and the matrix <i>A</i> is assumed unchanged on input.</p> <p>If <i>transa</i> = 'T' or 't', it is assumed that <i>A</i> should be transposed.</p> <p>If <i>transa</i> = 'C' or 'c', it is assumed that <i>A</i> should be conjugate transposed.</p> <p>If <i>transa</i> = 'R' or 'r', it is assumed that <i>A</i> should be conjugated (and not transposed).</p> <p>If the data is real, then <i>transa</i> = 'R' is the same as <i>transa</i> = 'N', and <i>transa</i> = 'C' is the same as <i>transa</i> = 'T'.</p>
<i>transb</i>	<p>CHARACTER*1. Parameter that specifies the operation type on matrix <i>B</i>.</p> <p>If <i>transb</i> = 'N' or 'n', $\text{op}(B)=B$ and the matrix <i>B</i> is assumed unchanged on input.</p> <p>If <i>transb</i> = 'T' or 't', it is assumed that <i>B</i> should be transposed.</p> <p>If <i>transb</i> = 'C' or 'c', it is assumed that <i>B</i> should be conjugate transposed.</p> <p>If <i>transb</i> = 'R' or 'r', it is assumed that <i>B</i> should be conjugated (and not transposed).</p> <p>If the data is real, then <i>transb</i> = 'R' is the same as <i>transb</i> = 'N', and <i>transb</i> = 'C' is the same as <i>transb</i> = 'T'.</p>
<i>m</i>	INTEGER. The number of matrix rows in $\text{op}(A)$, $\text{op}(B)$, and <i>C</i> .
<i>n</i>	INTEGER. The number of matrix columns in $\text{op}(A)$, $\text{op}(B)$, and <i>C</i> .
<i>alpha</i>	<p>REAL for mkl_somatadd.</p> <p>DOUBLE PRECISION for mkl_domatadd.</p> <p>COMPLEX for mkl_comatadd.</p>

DOUBLE COMPLEX for mkl_zomatadd.

This parameter scales the input matrix by *alpha*.

a

REAL for mkl_somatadd.

DOUBLE PRECISION for mkl_domatadd.

COMPLEX for mkl_comatadd.

DOUBLE COMPLEX for mkl_zomatadd.

Array, size $a(lda, *)$.

lda

INTEGER. Distance between the first elements in adjacent columns (in the case of the column-major order) or rows (in the case of the row-major order) in the source matrix *A*; measured in the number of elements.

For *ordering* = 'C' or 'c': when *transa* = 'N', 'n', 'R', or 'r', *lda* must be at least $\max(1, m)$; otherwise *lda* must be $\max(1, n)$.

For *ordering* = 'R' or 'r': when *transa* = 'N', 'n', 'R', or 'r', *lda* must be at least $\max(1, n)$; otherwise *lda* must be $\max(1, m)$.

beta

REAL for mkl_somatadd.

DOUBLE PRECISION for mkl_domatadd.

COMPLEX for mkl_comatadd.

DOUBLE COMPLEX for mkl_zomatadd.

This parameter scales the input matrix by *beta*.

b

REAL for mkl_somatadd.

DOUBLE PRECISION for mkl_domatadd.

COMPLEX for mkl_comatadd.

DOUBLE COMPLEX for mkl_zomatadd.

Array, size $b(l db, *)$.

ldb

INTEGER. Distance between the first elements in adjacent columns (in the case of the column-major order) or rows (in the case of the row-major order) in the source matrix *B*; measured in the number of elements.

For *ordering* = 'C' or 'c': when *transa* = 'N', 'n', 'R', or 'r', *ldb* must be at least $\max(1, m)$; otherwise *ldb* must be $\max(1, n)$.

For *ordering* = 'R' or 'r': when *transa* = 'N', 'n', 'R', or 'r', *ldb* must be at least $\max(1, n)$; otherwise *ldb* must be $\max(1, m)$.

ldc

INTEGER. Distance between the first elements in adjacent columns (in the case of the column-major order) or rows (in the case of the row-major order) in the destination matrix *C*; measured in the number of elements.

If *ordering* = 'C' or 'c', then *ldc* must be at least $\max(1, m)$, otherwise *ldc* must be at least $\max(1, n)$.

Output Parameters

c

REAL for mkl_somatadd.

```

DOUBLE PRECISION for mkl_domatadd.
COMPLEX for mkl_comatadd.
DOUBLE COMPLEX for mkl_zomatadd.
Array, size  $c(ldc, *)$ .

```

Interfaces

```

LAPACK Routines

This chapter describes the Intel® Math Kernel Library implementation of routines from the LAPACK package that are used for solving systems of linear equations, linear least squares problems, eigenvalue and singular value problems, and performing a number of related computational tasks. The library includes LAPACK routines for both real and complex data. Routines are supported for systems of equations with the following types of matrices:

- general
- banded
- symmetric or Hermitian positive-definite (full, packed, and rectangular full packed (RFP) storage)
- symmetric or Hermitian positive-definite banded
- symmetric or Hermitian indefinite (both full and packed storage)
- symmetric or Hermitian indefinite banded
- triangular (full, packed, and RFP storage)
- triangular banded
- tridiagonal
- diagonally dominant tridiagonal.

NOTE

Different arrays used as parameters to Intel MKL LAPACK routines must not overlap.

WARNING

LAPACK routines assume that input matrices do not contain IEEE 754 special values such as `INF` or `NaN` values. Using these special values may cause LAPACK to return unexpected results or become unstable.

Intel MKL supports the Fortran 95 interface, which uses simplified routine calls with shorter argument lists, in addition to the FORTRAN 77 interface to LAPACK computational and driver routines. The syntax section of the routine description gives the calling sequence for the Fortran 95 interface, where available, immediately after the FORTRAN 77 calls.

Routine Naming Conventions

To call one of the routines from a FORTRAN 77 program, you can use the LAPACK name.

LAPACK names have the structure `?yyzzz` or `?yyzz`, where the initial symbol `?` indicates the data type:

s	real, single precision
c	complex, single precision
d	real, double precision
z	complex, double precision

Some routines can have combined character codes, such as `ds` or `zc`.

The Fortran 95 interfaces to the LAPACK computational and driver routines are the same as the FORTRAN 77 names but without the first letter that indicates the data type. For example, the name of the routine that performs a triangular factorization of general real matrices in Fortran 95 is `getrf`. Different data types are handled through the definition of a specific internal parameter that refers to a module block with named constants for single and double precision.

Fortran 95 Interface Conventions

Intel® MKL implements the Fortran 95 interface to LAPACK through wrappers that call respective FORTRAN 77 routines. This interface uses such Fortran 95 features as assumed-shape arrays and optional arguments to provide simplified calls to LAPACK routines with fewer arguments.

NOTE

For LAPACK, Intel MKL offers two types of the Fortran 95 interfaces:

- using `mkl_lapack.fi` only through the `include 'mkl_lapack.fi'` statement. Such interfaces allow you to make use of the original LAPACK routines with all their arguments
 - using `lapack.f90` that includes improved interfaces. This file is used to generate the module files `lapack95.mod` and `f95_precision.mod`. See also the section "Fortran 95 interfaces and wrappers to LAPACK and BLAS" of the *Intel® MKL User's Guide* for details. The module files are used to process the FORTRAN use clauses referencing the LAPACK interface: `use lapack95` and `use f95_precision`.
-

The main conventions for the Fortran 95 interface are as follows:

- The names of arguments used in Fortran 95 call are typically the same as for the respective generic (FORTRAN 77) interface. In rare cases, formal argument names may be different. For instance, `select` instead of `selctg`.
- Input arguments such as array dimensions are not required in Fortran 95 and are skipped from the calling sequence. Array dimensions are reconstructed from the user data that must exactly follow the required array shape.

Another type of generic arguments that are skipped in the Fortran 95 interface are arguments that represent workspace arrays (such as `work`, `rwork`, and so on). The only exception are cases when workspace arrays return significant information on output.

NOTE

Internally, workspace arrays are allocated by the Fortran 95 interface wrapper, and are of optimal size for the best performance of the routine.

An argument can also be skipped if its value is completely defined by the presence or absence of another argument in the calling sequence, and the restored value is the only meaningful value for the skipped argument.

- Some generic arguments are declared as optional in the Fortran 95 interface and may or may not be present in the calling sequence. An argument can be declared optional if it meets one of the following conditions:
 - If an argument value is completely defined by the presence or absence of another argument in the calling sequence, it can be declared optional. The difference from the skipped argument in this case is that the optional argument can have some meaningful values that are distinct from the value reconstructed by default. For example, if some argument (like `jobz`) can take only two values and one of these values directly implies the use of another argument, then the value of `jobz` can be uniquely reconstructed from the actual presence or absence of this second argument, and `jobz` can be omitted.
 - If an input argument can take only a few possible values, it can be declared as optional. The default value of such argument is typically set as the first value in the list and all exceptions to this rule are explicitly stated in the routine description.
 - If an input argument has a natural default value, it can be declared as optional. The default value of such optional argument is set to its natural default value.

- Argument *info* is declared as optional in the Fortran 95 interface. If it is present in the calling sequence, the value assigned to *info* is interpreted as follows:
 - If this value is more than -1000, its meaning is the same as in the FORTRAN 77 routine.
 - If this value is equal to -1000, it means that there is not enough work memory.
 - If this value is equal to -1001, incompatible arguments are present in the calling sequence.
 - If this value is equal to -*i*, the *i*th parameter (counting parameters in the FORTRAN 77 interface, not the Fortran 95 interface) had an illegal value.
- Optional arguments are given in square brackets in the Fortran 95 call syntax.

The "Fortran 95 Notes" subsection at the end of the topic describing each routine details concrete rules for reconstructing the values of the omitted optional parameters.

Intel® MKL Fortran 95 Interfaces for LAPACK Routines vs. Netlib Implementation

The following list presents general digressions of the Intel MKL LAPACK95 implementation from the Netlib analog:

- The Intel MKL Fortran 95 interfaces are provided for pure procedures.
- Names of interfaces do not contain the `LA_` prefix.
- An optional array argument always has the `target` attribute.
- Functionality of the Intel MKL LAPACK95 wrapper is close to the FORTRAN 77 original implementation in the `getrf`, `gbtrf`, and `potrf` interfaces.
- If *jobz* argument value specifies presence or absence of *z* argument, then *z* is always declared as optional and *jobz* is restored depending on whether *z* is present or not.
- To avoid double error checking, processing of the *info* argument is limited to checking of the allocated memory and disarranging of optional arguments.
- If an argument that is present in the list of arguments completely defines another argument, the latter is always declared as optional.

You can transform an application that uses the Netlib LAPACK interfaces to ensure its work with the Intel MKL interfaces providing that:

- a. The application is correct, that is, unambiguous, compiler-independent, and contains no errors.
- b. Each routine name denotes only one specific routine. If any routine name in the application coincides with a name of the original Netlib routine (for example, after removing the `LA_` prefix) but denotes a routine different from the Netlib original routine, this name should be modified through context name replacement.

You should transform your application in the following cases:

- When using the Netlib routines that differ from the Intel MKL routines only by the `LA_` prefix or in the array attribute `target`. The only transformation required in this case is context name replacement.
- When using Netlib routines that differ from the Intel MKL routines by the `LA_` prefix, the `target` array attribute, and the names of formal arguments. In the case of positional passing of arguments, no additional transformation except context name replacement is required. In the case of the keywords passing of arguments, in addition to the context name replacement the names of mismatching keywords should also be modified.
- When using the Netlib routines that differ from the respective Intel MKL routines by the `LA_` prefix, the `target` array attribute, sequence of the arguments, arguments missing in Intel MKL but present in Netlib and, vice versa, present in Intel MKL but missing in Netlib. Remove the differences in the sequence and range of the arguments in process of all the transformations when you use the Netlib routines specified by this bullet and the preceding bullet.
- When using the `getrf`, `gbtrf`, and `potrf` interfaces, that is, new functionality implemented in Intel MKL but unavailable in the Netlib source. To override the differences, build the desired functionality explicitly with the Intel MKL means or create a new subroutine with the new functionality, using specific MKL interfaces corresponding to LAPACK 77 routines. You can call the LAPACK 77 routines directly but using the new Intel MKL interfaces is preferable. Note that if the transformed application calls `getrf`, `gbtrf` or `potrf` without controlling arguments *rcond* and *norm*, just context name replacement is enough in modifying the calls into the Intel MKL interfaces, as described in the first bullet above. The Netlib functionality is preserved in such cases.

- When using the Netlib auxiliary routines. In this case, call a corresponding subroutine directly, using the Intel MKL LAPACK 77 interfaces.

Transform your application as follows:

1. Make sure conditions a. and b. are met.
2. Select Netlib LAPACK 95 calls. For each call, do the following:
 - Select the type of digression and do the required transformations.
 - Revise results to eliminate unneeded code or data, which may appear after several identical calls.
3. Make sure the transformations are correct and complete.

Matrix Storage Schemes

LAPACK routines use the following matrix storage schemes:

- *Full storage*: an m -by- n matrix A is stored in a two-dimensional array a , with the matrix element a_{ij} ($i = 1..m, j = 1..n$), and stored in the array element $a(i, j)$.
- *Packed storage* scheme allows you to store symmetric, Hermitian, or triangular matrices more compactly: the upper or lower triangle of the matrix is packed by columns in a one-dimensional array.
- *Band storage*: an m -by- n band matrix with kl sub-diagonals and ku superdiagonals is stored compactly in a two-dimensional array ab with $kl+ku+1$ rows and n columns. Columns of the matrix are stored in the corresponding columns of the array, and *diagonals* of the matrix are stored in rows of the array.
- *Rectangular Full Packed (RFP) storage*: the upper or lower triangle of the matrix is packed combining the full and packed storage schemes. This combination enables using half of the full storage as packed storage while maintaining efficiency by using Level 3 BLAS/LAPACK kernels as the full storage.

Generally in LAPACK routines, arrays that hold matrices in packed storage have names ending in p ; arrays with matrices in band storage have names ending in b ; arrays with matrices in the RFP storage have names ending in fp .

For more information on matrix storage schemes, see ["Matrix Arguments"](#) in Appendix B.

Mathematical Notation

Descriptions of LAPACK routines use the following notation:

A^H	For an M -by- N matrix A , denotes the conjugate transposed N -by- M matrix with elements: $a_{ij}^H = \overline{a_{ji}}$ For a real-valued matrix, $A^H = A^T$.
$x \cdot y$	The <i>dot product</i> of two vectors, defined as: $x \cdot y = \sum_i x_i \overline{y_i}$
$Ax = b$	A system of linear equations with an n -by- n matrix $A = \{a_{ij}\}$, a right-hand side vector $b = \{b_i\}$, and an unknown vector $x = \{x_i\}$.
$AX = B$	A set of systems with a common matrix A and multiple right-hand sides. The columns of B are individual right-hand sides, and the columns of X are the corresponding solutions.
$ x $	the vector with elements $ x_i $ (absolute values of x_i).

$ A $	the matrix with elements $ a_{ij} $ (absolute values of a_{ij}).
$\ x\ _\infty = \max_i x_i $	The <i>infinity-norm</i> of the vector x .
$\ A\ _\infty = \max_i \sum_j a_{ij} $	The <i>infinity-norm</i> of the matrix A .
$\ A\ _1 = \max_j \sum_i a_{ij} $	The <i>one-norm</i> of the matrix A . $\ A\ _1 = \ A^T\ _\infty = \ A^H\ _\infty$
$\ x\ _2$	The <i>2-norm</i> of the vector x : $\ x\ _2 = (\sum_i x_i ^2)^{1/2} = \ x\ _E$ (see the definition for <i>Euclidean norm</i> in this section).
$\ A\ _2$	The <i>2-norm</i> (or <i>spectral norm</i>) of the matrix A . $\ A\ _2 = \max_i \sigma_i, \ A\ _2^2 = \max_{\ x\ _2=1} (Ax \cdot Ax)$
$\ A\ _E$	The <i>Euclidean norm</i> of the matrix A : $\ A\ _E^2 = \sum_i \sum_j a_{ij} ^2$.
$\kappa(A) = \ A\ \cdot \ A^{-1}\ $	The <i>condition number</i> of the matrix A .
λ_i	<i>Eigenvalues</i> of the matrix A (for the definition of eigenvalues, see Eigenvalue Problems).
σ_i	<i>Singular values</i> of the matrix A . They are equal to square roots of the eigenvalues of $A^H A$. (For more information, see Singular Value Decomposition).

Error Analysis

In practice, most computations are performed with rounding errors. Besides, you often need to solve a system $Ax = b$, where the data (the elements of A and b) are not known exactly. Therefore, it is important to understand how the data errors and rounding errors can affect the solution x .

Data perturbations. If x is the exact solution of $Ax = b$, and $x + \delta x$ is the exact solution of a perturbed problem $(A + \delta A)(x + \delta x) = (b + \delta b)$, then this estimate, given up to linear terms of perturbations, holds:

$$\frac{\| \delta x \|}{\| x \|} \leq c(n) \kappa(A) \varepsilon.$$

where $A + \delta A$ is nonsingular and

$$\kappa(A) = \|A\| \|A^{-1}\|.$$

In other words, relative errors in A or b may be amplified in the solution vector x by a factor $\kappa(A) = \|A\| \|A^{-1}\|$ called the *condition number* of A .

Rounding errors have the same effect as relative perturbations $c(n)\varepsilon$ in the original data. Here ε is the *machine precision*, defined as the smallest positive number x such that $1 + x > 1$; and $c(n)$ is a modest function of the matrix order n . The corresponding solution error is

$$\| \delta x \| / \| x \| \leq c(n) \kappa(A) \varepsilon. \quad (\text{The value of } c(n) \text{ is seldom greater than } 10n.)$$

NOTE

Machine precision depends on the data type used.

Thus, if your matrix A is *ill-conditioned* (that is, its condition number $\kappa(A)$ is very large), then the error in the solution x can also be large; you might even encounter a complete loss of precision. LAPACK provides routines that allow you to estimate $\kappa(A)$ (see [Routines for Estimating the Condition Number](#)) and also give you a more precise estimate for the actual solution error (see [Refining the Solution and Estimating Its Error](#)).

Linear Equation Routines

This section describes routines for performing the following computations:

- factoring the matrix (except for triangular matrices)
- equilibrating the matrix (except for RFP matrices)
- solving a system of linear equations
- estimating the condition number of a matrix (except for RFP matrices)
- refining the solution of linear equations and computing its error bounds (except for RFP matrices)
- inverting the matrix.

To solve a particular problem, you can call two or more [computational routines](#) or call a corresponding [driver routine](#) that combines several tasks in one call. For example, to solve a system of linear equations with a general matrix, call `?getrf` (*LU* factorization) and then `?getrs` (computing the solution). Then, call `?gerfs` to refine the solution and get the error bounds. Alternatively, use the driver routine `?gesvx` that performs all these tasks in one call.

Computational Routines

Table "Computational Routines for Systems of Equations with Real Matrices" lists the LAPACK computational routines (FORTRAN 77 and Fortran 95 interfaces) for factorizing, equilibrating, and inverting *real* matrices, estimating their condition numbers, solving systems of equations with real matrices, refining the solution, and estimating its error. Table "Computational Routines for Systems of Equations with Complex Matrices" lists similar routines for *complex* matrices. Respective routine names in the Fortran 95 interface are without the first symbol (see [Routine Naming Conventions](#)).

In the table above, ? stands for c (single precision complex) or z (double precision complex) for FORTRAN 77 interface.

Routines for Matrix Factorization

This section describes the LAPACK routines for matrix factorization. The following factorizations are supported:

- *LU* factorization

- Cholesky factorization of real symmetric positive-definite matrices
- Cholesky factorization of real symmetric positive-definite matrices with pivoting
- Cholesky factorization of Hermitian positive-definite matrices
- Cholesky factorization of Hermitian positive-definite matrices with pivoting
- Bunch-Kaufman factorization of real and complex symmetric matrices
- Bunch-Kaufman factorization of Hermitian matrices.

You can compute:

- the LU factorization using full and band storage of matrices
- the Cholesky factorization using full, packed, RFP, and band storage
- the Bunch-Kaufman factorization using full and packed storage.

?getrf

Computes the LU factorization of a general m -by- n matrix.

Syntax

```
call sgetrf( m, n, a, lda, ipiv, info )
call dgetrf( m, n, a, lda, ipiv, info )
call cgetrf( m, n, a, lda, ipiv, info )
call zgetrf( m, n, a, lda, ipiv, info )
call getrf( a [,ipiv] [,info] )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes the LU factorization of a general m -by- n matrix A as

$$A = P^*L^*U,$$

where P is a permutation matrix, L is lower triangular with unit diagonal elements (lower trapezoidal if $m > n$) and U is upper triangular (upper trapezoidal if $m < n$). The routine uses partial pivoting, with row interchanges.

NOTE

This routine supports the Progress Routine feature. See [Progress Function](#) section for details.

Input Parameters

m	INTEGER. The number of rows in the matrix A ($m \geq 0$).
n	INTEGER. The number of columns in A ; $n \geq 0$.
a	REAL for sgetrf DOUBLE PRECISION for dgetrf COMPLEX for cgetrf DOUBLE COMPLEX for zgetrf.

Array, size lda by $*$. Contains the matrix A . The second dimension of a must be at least $\max(1, n)$.

lda INTEGER. The leading dimension of array a .

Output Parameters

a Overwritten by L and U . The unit diagonal elements of L are not stored.

$ipiv$ INTEGER.
Array, size at least $\max(1, \min(m, n))$. The pivot indices; for $1 \leq i \leq \min(m, n)$, row i was interchanged with row $ipiv(i)$.

$info$ INTEGER. If $info=0$, the execution is successful.
If $info = -i$, the i -th parameter had an illegal value.
If $info = i$, u_{ii} is 0. The factorization has been completed, but U is exactly singular. Division by 0 will occur if you use the factor U for solving a system of linear equations.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `getrf` interface are as follows:

a Holds the matrix A of size (m, n) .

$ipiv$ Holds the vector of length $\min(m, n)$.

Application Notes

The computed L and U are the exact factors of a perturbed matrix $A + E$, where

$$|E| \leq c(\min(m, n)) \varepsilon P |L| |U|$$

$c(n)$ is a modest linear function of n , and ε is the machine precision.

The approximate number of floating-point operations for real flavors is

$$(2/3)n^3 \quad \text{If } m = n,$$

$$(1/3)n^2(3m-n) \quad \text{If } m > n,$$

$$(1/3)m^2(3n-m) \quad \text{If } m < n.$$

The number of operations for complex flavors is four times greater.

After calling this routine with $m = n$, you can call the following:

`?getrs` to solve $A^*X = B$ or $A^T X = B$ or $A^H X = B$

`?gecon` to estimate the condition number of A

`?getri` to compute the inverse of A .

[mkl_progress](#)
[Matrix Storage Schemes](#)

mkl_?getrfnpi

Performs LU factorization (complete or incomplete) of a general matrix without pivoting.

Syntax

```
call mkl_sgetrfnpi (m, n, nfact, a, lda, info)
call mkl_dgetrfnpi (m, n, nfact, a, lda, info )
call mkl_cgetrfnpi (m, n, nfact, a, lda, info )
call mkl_zgetrfnpi (m, n, nfact, a, lda, info )
call mkl_getrfnpi ( a [, nfact] [, info] )
```

Include Files

- `mkl.fi`, `lapack.f90`

Description

The routine computes the LU factorization of a general m -by- n matrix A without using pivoting. It supports incomplete factorization. The factorization has the form:

$$A = L * U,$$

where L is lower triangular with unit diagonal elements (lower trapezoidal if $m > n$) and U is upper triangular (upper trapezoidal if $m < n$).

Incomplete factorization has the form:

$$A = L * U + \tilde{A}$$

where L is lower trapezoidal with unit diagonal elements, U is upper trapezoidal, and \tilde{A} is the unfactored part of matrix A . See the application notes section for further details.

NOTE

Use [?getrf](#) if it is possible that the matrix is not diagonal dominant.

Input Parameters

The data types are given for the Fortran interface.

m	INTEGER. The number of rows in matrix A ; $m \geq 0$.
n	INTEGER. The number of columns in matrix A ; $n \geq 0$.
$nfact$	INTEGER. The number of rows and columns to factor; $0 \leq nfact \leq \min(m, n)$. Note that if $nfact < \min(m, n)$, incomplete factorization is performed.
a	REAL for <code>mkl_sgetrfnpi</code> DOUBLE PRECISION for <code>mkl_dgetrfnpi</code> COMPLEX for <code>mkl_cgetrfnpi</code>

DOUBLE COMPLEX for `mkl_zgetrfnpi`

Array of size $(lda, *)$. Contains the matrix A . The second dimension of a must be at least $\max(1, n)$.

lda INTEGER. The leading dimension of array a . $lda \geq \max(1, m)$.

Output Parameters

a Overwritten by L and U . The unit diagonal elements of L are not stored.
When incomplete factorization is specified by setting $nfact < \min(m, n)$, a

also contains the unfactored submatrix \tilde{A}_{22} . See the application notes section for further details.

$info$ INTEGER. If $info=0$, the execution is successful.
If $info = -i$, the i -th parameter had an illegal value.
If $info = i$, u_{ii} is 0. The requested factorization has been completed, but U is exactly singular. Division by 0 will occur if factorization is completed and factor U is used for solving a system of linear equations.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [Fortran 95 Interface Conventions](#).

Specific details for the routine `getrf` interface are as follows:

a Holds the matrix A of size (m, n) .

Application Notes

The computed L and U are the exact factors of a perturbed matrix $A + E$, with

$$|E| \leq c(\min(m, n)) \varepsilon |L| |U|$$

where $c(n)$ is a modest linear function of n , and ε is the machine precision.

The approximate number of floating-point operations for real flavors is

$(2/3)n^3$	If $m = n = nfact$
$(1/3)n^2(3m-n)$	If $m > n = nfact$
$(1/3)m^2(3n-m)$	If $m = nfact < n$
$(2/3)n^3 - (n-nfact)^3$	If $m = n, nfact < \min(m, n)$
$(1/3)(n^2(3m-n) - (n-nfact)^2(3m - 2nfact - n))$	If $m > n > nfact$
$(1/3)(m^2(3n-m) - (m-nfact)^2(3n - 2nfact - m))$	If $nfact < m < n$

The number of operations for complex flavors is four times greater.

When incomplete factorization is specified, the first $nfact$ rows and columns are factored, with the update of the remaining rows and columns of A as follows:

If matrix A is represented as a block 2-by-2 matrix:

$$A = \begin{bmatrix} A_{11} & A_{12} \\ A_{21} & A_{22} \end{bmatrix}$$

where

- A_{11} is a square matrix of order $nfact$,
- A_{21} is an $(m - nfact)$ -by- $nfact$ matrix,
- A_{12} is an $nfact$ -by- $(n - nfact)$ matrix, and
- A_{22} is an $(m - nfact)$ -by- $(n - nfact)$ matrix.

The result is

$$A = \begin{bmatrix} A_{11} & A_{12} \\ A_{21} & A_{22} \end{bmatrix} = \begin{bmatrix} L_1 \\ L_2 \end{bmatrix} \cdot \begin{bmatrix} U_1 & U_2 \end{bmatrix} + \begin{bmatrix} 0 & 0 \\ 0 & \tilde{A}_{22} \end{bmatrix}$$

L_1 is a lower triangular square matrix of order $nfact$ with unit diagonal and U_1 is an upper triangular square matrix of order $nfact$. L_1 and U_1 result from LU factorization of matrix A_{11} : $A_{11} = L_1 U_1$.

L_2 is an $(m - nfact)$ -by- $nfact$ matrix and $L_2 = A_{21} U_1^{-1}$. U_2 is an $nfact$ -by- $(n - nfact)$ matrix and $U_2 = L_1^{-1} A_{12}$.

\tilde{A}_{22} is an $(m - nfact)$ -by- $(n - nfact)$ matrix and $\tilde{A}_{22} = A_{22} - L_2 U_2$.

On exit, elements of the upper triangle U_1 are stored in place of the upper triangle of block A_{11} in array a ; elements of the lower triangle L_1 are stored in the lower triangle of block A_{11} in array a (unit diagonal

elements are not stored). Elements of L_2 replace elements of A_{21} ; U_2 replaces elements of A_{12} and \tilde{A}_{22} replaces elements of A_{22} .

?gbtrf

Computes the LU factorization of a general m -by- n band matrix.

Syntax

```
call sgbtrf( m, n, kl, ku, ab, ldab, ipiv, info )
call dgbtrf( m, n, kl, ku, ab, ldab, ipiv, info )
call cgbtrf( m, n, kl, ku, ab, ldab, ipiv, info )
call zgbtrf( m, n, kl, ku, ab, ldab, ipiv, info )
call gbtrf( ab [,kl] [,m] [,ipiv] [,info] )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine forms the LU factorization of a general m -by- n band matrix A with kl non-zero subdiagonals and ku non-zero superdiagonals, that is,

$$\tilde{A} = P * L * U,$$

where P is a permutation matrix; L is lower triangular with unit diagonal elements and at most kl non-zero elements in each column; U is an upper triangular band matrix with $kl + ku$ superdiagonals. The routine uses partial pivoting, with row interchanges (which creates the additional kl superdiagonals in U).

NOTE

This routine supports the Progress Routine feature. See [Progress Function](#) section for details.

Input Parameters

m	INTEGER. The number of rows in matrix A ; $m \geq 0$.
n	INTEGER. The number of columns in matrix A ; $n \geq 0$.
kl	INTEGER. The number of subdiagonals within the band of A ; $kl \geq 0$.

<i>ku</i>	INTEGER. The number of superdiagonals within the band of <i>A</i> ; $ku \geq 0$.
<i>ab</i>	REAL for <i>sgbtrf</i> DOUBLE PRECISION for <i>dgbtrf</i> COMPLEX for <i>cgbtrf</i> DOUBLE COMPLEX for <i>zgbtrf</i> . Array, size <i>ldab</i> by *. The array <i>ab</i> contains the matrix <i>A</i> in band storage, in rows $kl + 1$ to $2*kl + ku + 1$; rows 1 to <i>kl</i> of the array need not be set. The <i>j</i> -th column of <i>A</i> is stored in the <i>j</i> -th column of the array <i>ab</i> as follows: $ab(kl + ku + 1 + i - j, j) = a(i, j)$ for $\max(1, j - ku) \leq i \leq \min(m, j + kl)$.
<i>ldab</i>	INTEGER. The leading dimension of the array <i>ab</i> . ($ldab \geq 2*kl + ku + 1$)

Output Parameters

<i>ab</i>	Overwritten by <i>L</i> and <i>U</i> . <i>U</i> is stored as an upper triangular band matrix with $kl + ku$ superdiagonals in rows 1 to $kl + ku + 1$, and the multipliers used during the factorization are stored in rows $kl + ku + 2$ to $2*kl + ku + 1$. See Application Notes below for further details.
<i>ipiv</i>	INTEGER. Array, size at least $\max(1, \min(m, n))$. The pivot indices; for $1 \leq i \leq \min(m, n)$, row <i>i</i> was interchanged with row <i>ipiv</i> (<i>i</i>).
<i>info</i>	If <i>info</i> = 0, the execution is successful. If <i>info</i> = - <i>i</i> , the <i>i</i> -th parameter had an illegal value. If <i>info</i> = <i>i</i> , u_{ii} is 0. The factorization has been completed, but <i>U</i> is exactly singular. Division by 0 will occur if you use the factor <i>U</i> for solving a system of linear equations.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine *gbtrf* interface are as follows:

<i>ab</i>	Holds the array <i>A</i> of size $(2*kl+ku+1, n)$.
<i>ipiv</i>	Holds the vector of length $\min(m, n)$.
<i>kl</i>	If omitted, assumed $kl = ku$.
<i>ku</i>	Restored as $ku = lda - 2*kl - 1$.

m If omitted, assumed $m = n$.

Application Notes

The computed L and U are the exact factors of a perturbed matrix $A + E$, where

$$|E| \leq c(kl + ku + 1) \varepsilon P |L| |U|$$

$c(k)$ is a modest linear function of k , and ε is the machine precision.

The total number of floating-point operations for real flavors varies between approximately $2n(ku+1)kl$ and $2n(kl+ku+1)kl$. The number of operations for complex flavors is four times greater. All these estimates assume that kl and ku are much less than $\min(m, n)$.

The band storage scheme is illustrated by the following example, when $m = n = 6$, $kl = 2$, $ku = 1$:

on entry						on exit					
*	*	*	+	+	+	*	*	*	U_{14}	U_{25}	U_{36}
*	*	+	+	+	+	*	*	U_{13}	U_{24}	U_{35}	U_{46}
*	a_{12}	a_{23}	a_{34}	a_{45}	a_{56}	*	U_{12}	U_{23}	U_{34}	U_{45}	U_{56}
a_{11}	a_{22}	a_{33}	a_{44}	a_{55}	a_{66}	U_{11}	U_{22}	U_{33}	U_{44}	U_{55}	U_{66}
a_{21}	a_{32}	a_{43}	a_{54}	a_{65}	*	m_{21}	m_{32}	m_{43}	m_{54}	m_{65}	*
a_{31}	a_{42}	a_{53}	a_{64}	*	*	m_{31}	m_{42}	m_{53}	m_{64}	*	*

Elements marked * are not used; elements marked + need not be set on entry, but are required by the routine to store elements of U because of fill-in resulting from the row interchanges.

After calling this routine with $m = n$, you can call the following routines:

`gbtrs` to solve $A * X = B$ or $A^T * X = B$ or $A^H * X = B$

`gbcon` to estimate the condition number of A .

See Also

[mkl_progress](#)

[Matrix Storage Schemes](#)

?gttrf

Computes the LU factorization of a tridiagonal matrix.

Syntax

```
call sgtrf( n, dl, d, du, du2, ipiv, info )
call dgtrf( n, dl, d, du, du2, ipiv, info )
call cgtrf( n, dl, d, du, du2, ipiv, info )
call zgtrf( n, dl, d, du, du2, ipiv, info )
call gttrf( dl, d, du, du2 [, ipiv] [,info] )
```

Include Files

- `mkl.fi`, `lapack.f90`

Description

The routine computes the LU factorization of a real or complex tridiagonal matrix A using elimination with partial pivoting and row interchanges.

The factorization has the form

$$A = L^*U,$$

where L is a product of permutation and unit lower bidiagonal matrices and U is upper triangular with nonzeros in only the main diagonal and first two superdiagonals.

Input Parameters

n INTEGER. The order of the matrix A ; $n \geq 0$.

dl, d, du REAL for `sgttrf`
 DOUBLE PRECISION for `dgttrf`
 COMPLEX for `cgttrf`
 DOUBLE COMPLEX for `zgttrf`.

Arrays containing elements of A .

The array dl of dimension $(n - 1)$ contains the subdiagonal elements of A .

The array d of dimension n contains the diagonal elements of A .

The array du of dimension $(n - 1)$ contains the superdiagonal elements of A .

Output Parameters

dl Overwritten by the $(n-1)$ multipliers that define the matrix L from the LU factorization of A . The matrix L has unit diagonal elements, and the $(n-1)$ elements of dl form the subdiagonal. All other elements of L are zero.

d Overwritten by the n diagonal elements of the upper triangular matrix U from the LU factorization of A .

du Overwritten by the $(n-1)$ elements of the first superdiagonal of U .

$du2$ REAL for `sgttrf`
 DOUBLE PRECISION for `dgttrf`
 COMPLEX for `cgttrf`
 DOUBLE COMPLEX for `zgttrf`.

Array, dimension $(n - 2)$. On exit, $du2$ contains $(n-2)$ elements of the second superdiagonal of U .

$ipiv$ INTEGER.

Array, dimension (n) . The pivot indices: for $1 \leq i \leq n$, row i was interchanged with row $ipiv(i)$. $ipiv(i)$ is always i or $i+1$; $ipiv(i) = i$ indicates a row interchange was not required.

info INTEGER. If *info* = 0, the execution is successful.
 If *info* = -*i*, the *i*-th parameter had an illegal value.
 If *info* = *i*, *u_{ii}* is 0. The factorization has been completed, but *U* is exactly singular. Division by zero will occur if you use the factor *U* for solving a system of linear equations.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `gttrf` interface are as follows:

<i>dl</i>	Holds the vector of length $(n-1)$.
<i>d</i>	Holds the vector of length n .
<i>du</i>	Holds the vector of length $(n-1)$.
<i>du2</i>	Holds the vector of length $(n-2)$.
<i>ipiv</i>	Holds the vector of length n .

Application Notes

<code>?gbtrs</code>	to solve $A * X = B$ or $A^T * X = B$ or $A^H * X = B$
<code>?gbcon</code>	to estimate the condition number of A .

?dttrfb

Computes the factorization of a diagonally dominant tridiagonal matrix.

Syntax

```
call sdttrfb( n, dl, d, du, info )
call ddttrfb( n, dl, d, du, info )
call cdttrfb( n, dl, d, du, info )
call zdttrfb( n, dl, d, du, info )
call dttrfb( dl, d, du [, info] )
```

Include Files

- `mkl.fi`, `lapack.f90`

Description

The `?dttrfb` routine computes the factorization of a real or complex tridiagonal matrix A with the BABE (Burning At Both Ends) algorithm without pivoting. The factorization has the form

$$A = L_1 * U * L_2$$

where

- L_1 and L_2 are unit lower bidiagonal with k and $n - k - 1$ subdiagonal elements, respectively, where $k = n/2$, and
- U is an upper bidiagonal matrix with nonzeros in only the main diagonal and first superdiagonal.

Input Parameters

n INTEGER. The order of the matrix A ; $n \geq 0$.

dl, d, du REAL for `sdttrfb`
 DOUBLE PRECISION for `ddttrfb`
 COMPLEX for `cdttrfb`
 DOUBLE COMPLEX for `zdttrfb`.

Arrays containing elements of A .

The array dl of dimension $(n - 1)$ contains the subdiagonal elements of A .

The array d of dimension n contains the diagonal elements of A .

The array du of dimension $(n - 1)$ contains the superdiagonal elements of A .

Output Parameters

dl Overwritten by the $(n - 1)$ multipliers that define the matrix L from the LU factorization of A .

d Overwritten by the n diagonal element reciprocals of the upper triangular matrix U from the factorization of A .

du Overwritten by the $(n - 1)$ elements of the superdiagonal of U .

$info$ INTEGER. If $info = 0$, the execution is successful.
 If $info = -i$, the i -th parameter had an illegal value.
 If $info = i$, u_{ii} is 0. The factorization has been completed, but U is exactly singular. Division by zero will occur if you use the factor U for solving a system of linear equations.

Application Notes

A diagonally dominant tridiagonal system is defined such that $|d_i| > |dl_{i-1}| + |du_i|$ for any i :

$1 < i < n$, and $|d_1| > |du_1|$, $|d_n| > |dl_{n-1}|$

The underlying BABE algorithm is designed for diagonally dominant systems. Such systems are free from the numerical stability issue unlike the canonical systems that use elimination with partial pivoting (see [?gttrf](#)). The diagonally dominant systems are much faster than the canonical systems.

NOTE

- The current implementation of BABE has a potential accuracy issue on very small or large data close to the underflow or overflow threshold respectively. Scale the matrix before applying the solver in the case of such input data.
- Applying the ?dtrfb factorization to non-diagonally dominant systems may lead to an accuracy loss, or false singularity detected due to no pivoting.

?potrf

Computes the Cholesky factorization of a symmetric (Hermitian) positive-definite matrix.

Syntax

```
call spotrf( uplo, n, a, lda, info )
call dpotrf( uplo, n, a, lda, info )
call cpotrf( uplo, n, a, lda, info )
call zpotrf( uplo, n, a, lda, info )
call potrf( a [, uplo] [,info] )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine forms the Cholesky factorization of a symmetric positive-definite or, for complex data, Hermitian positive-definite matrix A :

$$\begin{aligned} A &= U^T * U \text{ for real data, } A = U^H * U \text{ for complex data} && \text{if } uplo = 'U' \\ A &= L * L^T \text{ for real data, } A = L * L^H \text{ for complex data} && \text{if } uplo = 'L' \end{aligned}$$

where L is a lower triangular matrix and U is upper triangular.

NOTE

This routine supports the Progress Routine feature. See [Progress Function](#) section for details.

Input Parameters

<i>uplo</i>	CHARACTER*1. Must be 'U' or 'L'. Indicates whether the upper or lower triangular part of A is stored and how A is factored: If <i>uplo</i> = 'U', the array <i>a</i> stores the upper triangular part of the matrix A , and the strictly lower triangular part of the matrix is not referenced. If <i>uplo</i> = 'L', the array <i>a</i> stores the lower triangular part of the matrix A , and the strictly upper triangular part of the matrix is not referenced.
<i>n</i>	INTEGER. The order of matrix A ; $n \geq 0$.

<i>a</i>	<p>REAL for <code>spotrf</code></p> <p>DOUBLE PRECISION for <code>dpotrf</code></p> <p>COMPLEX for <code>cpotrf</code></p> <p>DOUBLE COMPLEX for <code>zpotrf</code>.</p> <p>Array, size $(lda, *)$. The array <i>a</i> contains either the upper or the lower triangular part of the matrix <i>A</i> (see <i>uplo</i>). The second dimension of <i>a</i> must be at least $\max(1, n)$.</p>
<i>lda</i>	INTEGER. The leading dimension of <i>a</i> .

Output Parameters

<i>a</i>	The upper or lower triangular part of <i>a</i> is overwritten by the Cholesky factor <i>U</i> or <i>L</i> , as specified by <i>uplo</i> .
<i>info</i>	<p>INTEGER. If <i>info</i>=0, the execution is successful.</p> <p>If <i>info</i> = $-i$, the <i>i</i>-th parameter had an illegal value.</p> <p>If <i>info</i> = <i>i</i>, the leading minor of order <i>i</i> (and therefore the matrix <i>A</i> itself) is not positive-definite, and the factorization could not be completed. This may indicate an error in forming the matrix <i>A</i>.</p>

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `potrf` interface are as follows:

<i>a</i>	Holds the matrix <i>A</i> of size (n, n) .
<i>uplo</i>	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

If *uplo* = 'U', the computed factor *U* is the exact factor of a perturbed matrix $A + E$, where

$$|E| \leq c(n)\varepsilon |U^H| |U|, |e_{ij}| \leq c(n)\varepsilon \sqrt{a_{ii}a_{jj}}$$

$c(n)$ is a modest linear function of n , and ε is the machine precision.

A similar estimate holds for *uplo* = 'L'.

The total number of floating-point operations is approximately $(1/3)n^3$ for real flavors or $(4/3)n^3$ for complex flavors.

After calling this routine, you can call the following routines:

<code>?potrs</code>	to solve $A * X = B$
<code>?pocon</code>	to estimate the condition number of <i>A</i>

[?potri](#) to compute the inverse of A .

?pstrf

Computes the Cholesky factorization with complete pivoting of a real symmetric (complex Hermitian) positive semidefinite matrix.

Syntax

```
call spstrf( uplo, n, a, lda, piv, rank, tol, work, info )
call dpstrf( uplo, n, a, lda, piv, rank, tol, work, info )
call cpstrf( uplo, n, a, lda, piv, rank, tol, work, info )
call zpstrf( uplo, n, a, lda, piv, rank, tol, work, info )
```

Include Files

- `mkl.fi`, `lapack.f90`

Description

The routine computes the Cholesky factorization with complete pivoting of a real symmetric (complex Hermitian) positive semidefinite matrix. The form of the factorization is:

$$\begin{aligned} P^T * A * P &= U^T * U, \text{ if } uplo = 'U' \text{ for real flavors,} \\ P^T * A * P &= U^H * U, \text{ if } uplo = 'U' \text{ for complex flavors,} \\ P^T * A * P &= L * L^T, \text{ if } uplo = 'L' \text{ for real flavors,} \\ P^T * A * P &= L * L^H, \text{ if } uplo = 'L' \text{ for complex flavors,} \end{aligned}$$

where P is a permutation matrix stored as vector `piv`, and U and L are upper and lower triangular matrices, respectively.

This algorithm does not attempt to check that A is positive semidefinite. This version of the algorithm calls level 3 BLAS.

Input Parameters

<code>uplo</code>	CHARACTER*1. Must be 'U' or 'L'. Indicates whether the upper or lower triangular part of A is stored: If <code>uplo = 'U'</code> , the array <code>a</code> stores the upper triangular part of the matrix A , and the strictly lower triangular part of the matrix is not referenced. If <code>uplo = 'L'</code> , the array <code>a</code> stores the lower triangular part of the matrix A , and the strictly upper triangular part of the matrix is not referenced.
<code>n</code>	INTEGER. The order of matrix A ; $n \geq 0$.
<code>a, work</code>	REAL for <code>spstrf</code> DOUBLE PRECISION for <code>dpstrf</code>

COMPLEX for `cpstrf`

DOUBLE COMPLEX for `zpstrf`.

Array `a`, size $(lda, *)$. The array `a` contains either the upper or the lower triangular part of the matrix A (see `uplo`). The second dimension of `a` must be at least $\max(1, n)$.

`work(*)` is a workspace array. The dimension of `work` is at least $\max(1, 2*n)$.

`tol`

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

User defined tolerance. If `tol` < 0, then $n*\epsilon*\max(A_{k,k})$, where ϵ is the machine precision, will be used (see [Error Analysis](#) for the definition of machine precision). The algorithm terminates at the $(k-1)$ -st step, if the pivot $\leq tol$.

`lda`

INTEGER. The leading dimension of `a`; at least $\max(1, n)$.

Output Parameters

`a`

If `info` = 0, the factor U or L from the Cholesky factorization is as described in *Description*.

`piv`

INTEGER.

Array, size at least $\max(1, n)$. The array `piv` is such that the nonzero entries are $P_{piv(k), k}$ ($1 \leq k \leq n$).

`rank`

INTEGER.

The rank of `a` given by the number of steps the algorithm completed.

`info`

INTEGER. If `info` = 0, the execution is successful.

If `info` = $-k$, the k -th argument had an illegal value.

If `info` > 0, the matrix A is either rank deficient with a computed rank as returned in `rank`, or is not positive semidefinite.

?pftrf

Computes the Cholesky factorization of a symmetric (Hermitian) positive-definite matrix using the Rectangular Full Packed (RFP) format .

Syntax

```
call spftrf( transr, uplo, n, a, info )
```

```
call dpftrf( transr, uplo, n, a, info )
```

```
call cpftrf( transr, uplo, n, a, info )
```

```
call zpftrf( transr, uplo, n, a, info )
```

Include Files

- `mkl.fi`, `lapack.f90`

Description

The routine forms the Cholesky factorization of a symmetric positive-definite or, for complex data, a Hermitian positive-definite matrix A :

$$\begin{aligned} A &= U^T * U \text{ for real data, } A = U^H * U \text{ for complex data} && \text{if } uplo = 'U' \\ A &= L * L^T \text{ for real data, } A = L * L^H \text{ for complex data} && \text{if } uplo = 'L' \end{aligned}$$

where L is a lower triangular matrix and U is upper triangular.

The matrix A is in the Rectangular Full Packed (RFP) format. For the description of the RFP format, see [Matrix Storage Schemes](#).

This is the block version of the algorithm, calling Level 3 BLAS.

Input Parameters

<i>transr</i>	<p>CHARACTER*1. Must be 'N', 'T' (for real data) or 'C' (for complex data).</p> <p>If <i>transr</i> = 'N', the Normal <i>transr</i> of RFP A is stored.</p> <p>If <i>transr</i> = 'T', the Transpose <i>transr</i> of RFP A is stored.</p> <p>If <i>transr</i> = 'C', the Conjugate-Transpose <i>transr</i> of RFP A is stored.</p>
<i>uplo</i>	<p>CHARACTER*1. Must be 'U' or 'L'.</p> <p>Indicates whether the upper or lower triangular part of A is stored:</p> <p>If <i>uplo</i> = 'U', the array <i>a</i> stores the upper triangular part of the matrix A.</p> <p>If <i>uplo</i> = 'L', the array <i>a</i> stores the lower triangular part of the matrix A.</p>
<i>n</i>	<p>INTEGER. The order of the matrix A; $n \geq 0$.</p>
<i>a</i>	<p>REAL for <code>spftrf</code></p> <p>DOUBLE PRECISION for <code>dpftrf</code></p> <p>COMPLEX for <code>cpftrf</code></p> <p>DOUBLE COMPLEX for <code>zpftrf</code>.</p> <p>Array, size $(n * (n + 1) / 2)$. The array <i>a</i> contains the matrix A in the RFP format.</p>

Output Parameters

<i>a</i>	<p><i>a</i> is overwritten by the Cholesky factor U or L, as specified by <i>uplo</i> and <i>trans</i>.</p>
<i>info</i>	<p>INTEGER. If <i>info</i>=0, the execution is successful.</p> <p>If <i>info</i> = $-i$, the i-th parameter had an illegal value.</p>

If $info = i$, the leading minor of order i (and therefore the matrix A itself) is not positive-definite, and the factorization could not be completed. This may indicate an error in forming the matrix A .

```

Include Files

- mkl.fi, lapack.f90

Description

The routine forms the Cholesky factorization of a symmetric positive-definite or, for complex data, Hermitian positive-definite packed matrix A :

$$\begin{aligned} A &= U^T * U \text{ for real data, } A = U^H * U \text{ for complex data} && \text{if } uplo = 'U' \\ A &= L * L^T \text{ for real data, } A = L * L^H \text{ for complex data} && \text{if } uplo = 'L' \end{aligned}$$

where L is a lower triangular matrix and U is upper triangular.

NOTE

This routine supports the Progress Routine feature. See [Progress Function](#) section for details.

Input Parameters

<i>uplo</i>	CHARACTER*1. Must be 'U' or 'L'. Indicates whether the upper or lower triangular part of A is packed in the array ap , and how A is factored: If $uplo = 'U'$, the array ap stores the upper triangular part of the matrix A , and A is factored as $U^H * U$. If $uplo = 'L'$, the array ap stores the lower triangular part of the matrix A ; A is factored as $L * L^H$.
<i>n</i>	INTEGER. The order of matrix A ; $n \geq 0$.
<i>ap</i>	REAL for spptrf DOUBLE PRECISION for dpptrf

COMPLEX for `cpptrf`

DOUBLE COMPLEX for `zpptrf`.

Array, size at least $\max(1, n(n+1)/2)$. The array *ap* contains either the upper or the lower triangular part of the matrix *A* (as specified by *uplo*) in packed storage (see [Matrix Storage Schemes](#)).

Output Parameters

ap

Overwritten by the Cholesky factor *U* or *L*, as specified by *uplo*.

info

INTEGER. If *info*=0, the execution is successful.

If *info* = *-i*, the *i*-th parameter had an illegal value.

If *info* = *i*, the leading minor of order *i* (and therefore the matrix *A* itself) is not positive-definite, and the factorization could not be completed. This may indicate an error in forming the matrix *A*.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `pptrf` interface are as follows:

ap

Holds the array *A* of size $(n*(n+1)/2)$.

uplo

Must be 'U' or 'L'. The default value is 'U'.

Application Notes

If *uplo* = 'U', the computed factor *U* is the exact factor of a perturbed matrix $A + E$, where

$$|E| \leq c(n)\varepsilon |U^H| |U|, |e_{ij}| \leq c(n)\varepsilon \sqrt{a_{ii}a_{jj}}$$

$c(n)$ is a modest linear function of *n*, and ε is the machine precision.

A similar estimate holds for *uplo* = 'L'.

The total number of floating-point operations is approximately $(1/3)n^3$ for real flavors and $(4/3)n^3$ for complex flavors.

After calling this routine, you can call the following routines:

`?pptrs`

to solve $A^*X = B$

`?ppcon`

to estimate the condition number of *A*

`?pptri`

to compute the inverse of *A*.

Description

The routine forms the Cholesky factorization of a symmetric positive-definite or, for complex data, Hermitian positive-definite band matrix A :

$$\begin{aligned} A &= U^T * U \text{ for real data, } A = U^H * U \text{ for complex data} && \text{if } uplo = 'U' \\ A &= L * L^T \text{ for real data, } A = L * L^H \text{ for complex data} && \text{if } uplo = 'L' \end{aligned}$$

where L is a lower triangular matrix and U is upper triangular.

NOTE

This routine supports the Progress Routine feature. See [Progress Function](#) section for details.

Input Parameters

<i>uplo</i>	CHARACTER*1. Must be 'U' or 'L'. Indicates whether the upper or lower triangular part of A is stored in the array <i>ab</i> , and how A is factored: If <i>uplo</i> = 'U', the upper triangle of A is stored. If <i>uplo</i> = 'L', the lower triangle of A is stored.
<i>n</i>	INTEGER. The order of matrix A ; $n \geq 0$.
<i>kd</i>	INTEGER. The number of superdiagonals or subdiagonals in the matrix A ; $kd \geq 0$.
<i>ab</i>	REAL for spbtrf DOUBLE PRECISION for dpbtrf COMPLEX for cpbtrf DOUBLE COMPLEX for zpbtrf. Array, size (<i>ldab</i> , *). The array <i>ab</i> contains either the upper or the lower triangular part of the matrix A (as specified by <i>uplo</i>) in band storage (see Matrix Storage Schemes). The second dimension of <i>ab</i> must be at least $\max(1, n)$.

ldab INTEGER. The leading dimension of the array *ab*. ($ldab \geq kd + 1$)

Output Parameters

ab The upper or lower triangular part of *A* (in band storage) is overwritten by the Cholesky factor *U* or *L*, as specified by *uplo*.

info INTEGER. If *info*=0, the execution is successful.
 If *info* = -*i*, the *i*-th parameter had an illegal value.
 If *info* = *i*, the leading minor of order *i* (and therefore the matrix *A* itself) is not positive-definite, and the factorization could not be completed. This may indicate an error in forming the matrix *A*.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `pbtrf` interface are as follows:

ab Holds the array *A* of size $(kd+1, n)$.

uplo Must be 'U' or 'L'. The default value is 'U'.

Application Notes

If *uplo* = 'U', the computed factor *U* is the exact factor of a perturbed matrix $A + E$, where

?pttrf

Computes the factorization of a symmetric (Hermitian) positive-definite tridiagonal matrix.

Syntax

call `spttrf(n, d, e, info)`

```
call dpttrf( n, d, e, info )
call cpttrf( n, d, e, info )
call zpttrf( n, d, e, info )
call pttrf( d, e [,info] )
```

Include Files

- `mkl.fi, lapack.f90`

Description

The routine forms the factorization of a symmetric positive-definite or, for complex data, Hermitian positive-definite tridiagonal matrix A :

$A = L * D * L^T$ for real flavors, or

$A = L * D * L^H$ for complex flavors,

where D is diagonal and L is unit lower bidiagonal. The factorization may also be regarded as having the form $A = U^T * D * U$ for real flavors, or $A = U^H * D * U$ for complex flavors, where U is unit upper bidiagonal.

Input Parameters

n	INTEGER. The order of the matrix A ; $n \geq 0$.
d	REAL for <code>spttrf</code> , <code>cpttrf</code> DOUBLE PRECISION for <code>dpttrf</code> , <code>zpttrf</code> . Array, dimension (n). Contains the diagonal elements of A .
e	REAL for <code>spttrf</code> DOUBLE PRECISION for <code>dpttrf</code> COMPLEX for <code>cpttrf</code> DOUBLE COMPLEX for <code>zpttrf</code> . Array, dimension ($n - 1$). Contains the subdiagonal elements of A .

Output Parameters

d	Overwritten by the n diagonal elements of the diagonal matrix D from the $L * D * L^T$ (for real flavors) or $L * D * L^H$ (for complex flavors) factorization of A .
e	Overwritten by the $(n - 1)$ sub-diagonal elements of the unit bidiagonal factor L or U from the factorization of A .
$info$	INTEGER. If $info = 0$, the execution is successful. If $info = -i$, the i -th parameter had an illegal value. If $info = i$, the leading minor of order i (and therefore the matrix A itself) is not positive-definite; if $i < n$, the factorization could not be completed, while if $i = n$, the factorization was completed, but $d(n) \leq 0$.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `pttrf` interface are as follows:

<code>d</code>	Holds the vector of length n .
<code>e</code>	Holds the vector of length $(n-1)$.

?sytrf

Computes the Bunch-Kaufman factorization of a symmetric matrix.

Syntax

```
call ssytrf( uplo, n, a, lda, ipiv, work, lwork, info )
call dsytrf( uplo, n, a, lda, ipiv, work, lwork, info )
call csytrf( uplo, n, a, lda, ipiv, work, lwork, info )
call zsytrf( uplo, n, a, lda, ipiv, work, lwork, info )
call sytrf( a [, uplo] [,ipiv] [,info] )
```

Include Files

- `mkl.fi`, `lapack.f90`

Description

The routine computes the factorization of a real/complex symmetric matrix A using the Bunch-Kaufman diagonal pivoting method. The form of the factorization is:

if $uplo = 'U'$, $A = U * D * U^T$
 if $uplo = 'L'$, $A = L * D * L^T$,

where A is the input matrix, U and L are products of permutation and triangular matrices with unit diagonal (upper triangular for U and lower triangular for L), and D is a symmetric block-diagonal matrix with 1-by-1 and 2-by-2 diagonal blocks. U and L have 2-by-2 unit diagonal blocks corresponding to the 2-by-2 blocks of D .

NOTE

This routine supports the Progress Routine feature. See [Progress Routines](#) section for details.

Input Parameters

<code>uplo</code>	CHARACTER*1. Must be 'U' or 'L'. Indicates whether the upper or lower triangular part of A is stored and how A is factored: If $uplo = 'U'$, the array a stores the upper triangular part of the matrix A , and A is factored as $U * D * U^T$.
-------------------	---

If $uplo = 'L'$, the array a stores the lower triangular part of the matrix A , and A is factored as $L^*D^*L^T$.

n INTEGER. The order of matrix A ; $n \geq 0$.

a REAL for `ssytrf`
 DOUBLE PRECISION for `dsytrf`
 COMPLEX for `csytrf`
 DOUBLE COMPLEX for `zsytrf`.

Array, size $(lda, *)$. The array a contains either the upper or the lower triangular part of the matrix A (see $uplo$). The second dimension of a must be at least $\max(1, n)$.

lda INTEGER. The leading dimension of a ; at least $\max(1, n)$.

$work$ Same type as a . A workspace array, dimension at least $\max(1, lwork)$.

$lwork$ INTEGER. The size of the $work$ array ($lwork \geq n$).

If $lwork = -1$, then a workspace query is assumed; the routine only calculates the optimal size of the $work$ array, returns this value as the first entry of the $work$ array, and no error message related to $lwork$ is issued by `xerbla`.

See [Application Notes](#) for the suggested value of $lwork$.

Output Parameters

a The upper or lower triangular part of a is overwritten by details of the block-diagonal matrix D and the multipliers used to obtain the factor U (or L).

$work(1)$ If $info=0$, on exit $work(1)$ contains the minimum value of $lwork$ required for optimum performance. Use this $lwork$ for subsequent runs.

$ipiv$ INTEGER.

Array, size at least $\max(1, n)$. Contains details of the interchanges and the block structure of D . If $ipiv(i) = k > 0$, then d_{ii} is a 1-by-1 block, and the i -th row and column of A was interchanged with the k -th row and column.

If $uplo = 'U'$ and $ipiv(i) = ipiv(i-1) = -m < 0$, then D has a 2-by-2 block in rows/columns i and $i-1$, and $(i-1)$ -th row and column of A was interchanged with the m -th row and column.

If $uplo = 'L'$ and $ipiv(i) = ipiv(i+1) = -m < 0$, then D has a 2-by-2 block in rows/columns i and $i+1$, and $(i+1)$ -th row and column of A was interchanged with the m -th row and column.

$info$ INTEGER. If $info = 0$, the execution is successful.

If $info = -i$, the i -th parameter had an illegal value.

If $info = i$, D_{ii} is 0. The factorization has been completed, but D is exactly singular. Division by 0 will occur if you use D for solving a system of linear equations.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `sytrf` interface are as follows:

<code>a</code>	holds the matrix A of size (n, n)
<code>ipiv</code>	holds the vector of length n
<code>uplo</code>	must be 'U' or 'L'. The default value is 'U'.

Application Notes

For better performance, try using $lwork = n * blocksize$, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set $lwork = -1$.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value ($work(1)$) for subsequent runs.

If you set $lwork = -1$, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The 2-by-2 unit diagonal blocks and the unit diagonal elements of U and L are not stored. The remaining elements of U and L are stored in the corresponding columns of the array *a*, but additional row interchanges are required to recover U or L explicitly (which is seldom necessary).

If $ipiv(i) = i$ for all $i = 1 \dots n$, then all off-diagonal elements of U (L) are stored explicitly in the corresponding elements of the array *a*.

If $uplo = 'U'$, the computed factors U and D are the exact factors of a perturbed matrix $A + E$, where

$$|E| \leq c(n) \varepsilon P |U| |D| |U^T| P^T$$

$c(n)$ is a modest linear function of n , and ε is the machine precision. A similar estimate holds for the computed L and D when $uplo = 'L'$.

The total number of floating-point operations is approximately $(1/3)n^3$ for real flavors or $(4/3)n^3$ for complex flavors.

After calling this routine, you can call the following routines:

<code>?sytrs</code>	to solve $A * X = B$
<code>?sycon</code>	to estimate the condition number of A
<code>?sytri</code>	to compute the inverse of A .

If $uplo = 'U'$, then $A = U * D * U'$, where

$$U = P(n) * U(n) * \dots * P(k) * U(k) * \dots,$$

that is, U is a product of terms $P(k) * U(k)$, where

- k decreases from n to 1 in steps of 1 and 2.
- D is a block diagonal matrix with 1-by-1 and 2-by-2 diagonal blocks $D(k)$.
- $P(k)$ is a permutation matrix as defined by $ipiv(k)$.
- $U(k)$ is a unit upper triangular matrix, such that if the diagonal block $D(k)$ is of order s ($s = 1$ or 2), then

$$U(k) = \begin{pmatrix} I & v & 0 \\ 0 & I & 0 \\ 0 & 0 & I \end{pmatrix} \begin{matrix} k-s \\ s \\ n-k \end{matrix}$$

$k-s \quad s \quad n-k$

If $s = 1$, $D(k)$ overwrites $A(k,k)$, and v overwrites $A(1:k-1,k)$.

If $s = 2$, the upper triangle of $D(k)$ overwrites $A(k-1,k-1)$, $A(k-1,k)$ and $A(k,k)$, and v overwrites $A(1:k-2,k-1:k)$.

If $uplo = 'L'$, then $A = L * D * L'$, where

$$L = P(1) * L(1) * \dots * P(k) * L(k) * \dots,$$

that is, L is a product of terms $P(k) * L(k)$, where

- k increases from 1 to n in steps of 1 and 2.
- D is a block diagonal matrix with 1-by-1 and 2-by-2 diagonal blocks $D(k)$.
- $P(k)$ is a permutation matrix as defined by $ipiv(k)$.
- $L(k)$ is a unit lower triangular matrix, such that if the diagonal block $D(k)$ is of order s ($s = 1$ or 2), then

$$L(k) = \begin{pmatrix} I & 0 & 0 \\ 0 & I & 0 \\ 0 & v & I \end{pmatrix} \begin{matrix} k-1 \\ s \\ n-k-s+1 \end{matrix}$$

$k-1 \quad s \quad n-k-s+1$

If $s = 1$, $D(k)$ overwrites $A(k,k)$, and v overwrites $A(k+1:n,k)$.

If $s = 2$, the lower triangle of $D(k)$ overwrites $A(k,k)$, $A(k+1,k)$, and $A(k+1,k+1)$, and v overwrites $A(k+2:n,k:k+1)$.

?sytrf_rook

Computes the bounded Bunch-Kaufman factorization of a symmetric matrix.

Syntax

```
call ssytrf_rook( uplo, n, a, lda, ipiv, work, lwork, info )
call dsytrf_rook( uplo, n, a, lda, ipiv, work, lwork, info )
call csytrf_rook( uplo, n, a, lda, ipiv, work, lwork, info )
call zsytrf_rook( uplo, n, a, lda, ipiv, work, lwork, info )
call sytrf_rook( a [, uplo] [,ipiv] [,info] )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes the factorization of a real/complex symmetric matrix A using the bounded Bunch-Kaufman ("rook") diagonal pivoting method. The form of the factorization is:

if $uplo = 'U'$, $A = U * D * U^T$
 if $uplo = 'L'$, $A = L * D * L^T$,

where A is the input matrix, U and L are products of permutation and triangular matrices with unit diagonal (upper triangular for U and lower triangular for L), and D is a symmetric block-diagonal matrix with 1-by-1 and 2-by-2 diagonal blocks. U and L have 2-by-2 unit diagonal blocks corresponding to the 2-by-2 blocks of D .

Input Parameters

<i>uplo</i>	CHARACTER*1. Must be 'U' or 'L'. Indicates whether the upper or lower triangular part of A is stored and how A is factored: If $uplo = 'U'$, the array a stores the upper triangular part of the matrix A , and A is factored as $U * D * U^T$. If $uplo = 'L'$, the array a stores the lower triangular part of the matrix A , and A is factored as $L * D * L^T$.
<i>n</i>	INTEGER. The order of matrix A ; $n \geq 0$.
<i>a</i>	REAL for ssytrf_rook DOUBLE PRECISION for dsytrf_rook COMPLEX for csytrf_rook DOUBLE COMPLEX for zsytrf_rook. Array, size $(lda, *)$. The array a contains either the upper or the lower triangular part of the matrix A (see <i>uplo</i>). The second dimension of a must be at least $\max(1, n)$.
<i>lda</i>	INTEGER. The leading dimension of a ; at least $\max(1, n)$.

<i>work</i>	Same type as <i>a</i> . A workspace array, dimension at least $\max(1, lwork)$.
<i>lwork</i>	INTEGER. The size of the <i>work</i> array ($lwork \geq n$). If $lwork = -1$, then a workspace query is assumed; the routine only calculates the optimal size of the <i>work</i> array, returns this value as the first entry of the <i>work</i> array, and no error message related to <i>lwork</i> is issued by xerbla. See ?sytrf Application Notes for the suggested value of <i>lwork</i> .

Output Parameters

<i>a</i>	The upper or lower triangular part of <i>a</i> is overwritten by details of the block-diagonal matrix <i>D</i> and the multipliers used to obtain the factor <i>U</i> (or <i>L</i>).
<i>work</i> (1)	If <i>info</i> =0, on exit <i>work</i> (1) contains the minimum value of <i>lwork</i> required for optimum performance. Use this <i>lwork</i> for subsequent runs.
<i>ipiv</i>	INTEGER. Array, size at least $\max(1, n)$. Contains details of the interchanges and the block structure of <i>D</i> . If $ipiv(k) > 0$, then rows and columns <i>k</i> and $ipiv(k)$ were interchanged and $D_{k,k}$ is a 1-by-1 diagonal block. If $uplo = 'U'$ and $ipiv(k) < 0$ and $ipiv(k - 1) < 0$, then rows and columns <i>k</i> and $-ipiv(k)$ were interchanged, rows and columns <i>k</i> - 1 and $-ipiv(k - 1)$ were interchanged, and $D_{k-1:k, k-1:k}$ is a 2-by-2 diagonal block. If $uplo = 'L'$ and $ipiv(k) < 0$ and $ipiv(k + 1) < 0$, then rows and columns <i>k</i> and $-ipiv(k)$ were interchanged, rows and columns <i>k</i> + 1 and $-ipiv(k + 1)$ were interchanged, and $D_{k:k+1, k:k+1}$ is a 2-by-2 diagonal block.
<i>info</i>	INTEGER. If <i>info</i> = 0, the execution is successful. If <i>info</i> = - <i>i</i> , the <i>i</i> -th parameter had an illegal value. If <i>info</i> = <i>i</i> , D_{ii} is 0. The factorization has been completed, but <i>D</i> is exactly singular. Division by 0 will occur if you use <i>D</i> for solving a system of linear equations.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `sytrf_rook` interface are as follows:

<i>a</i>	holds the matrix <i>A</i> of size (<i>n</i> , <i>n</i>)
<i>ipiv</i>	holds the vector of length <i>n</i>

`uplo` must be 'U' or 'L'. The default value is 'U'.

Application Notes

The total number of floating-point operations is approximately $(1/3)n^3$ for real flavors or $(4/3)n^3$ for complex flavors.

After calling this routine, you can call the following routines:

<code>?sytrs_rook</code>	to solve $A * X = B$
<code>?sycon_rook</code>	to estimate the condition number of A
<code>?sytri_rook</code>	to compute the inverse of A .

If `uplo` = 'U', then $A = U * D * U'$, where

$$U = P(n) * U(n) * \dots * P(k) * U(k) * \dots,$$

that is, U is a product of terms $P(k) * U(k)$, where

- k decreases from n to 1 in steps of 1 and 2.
- D is a block diagonal matrix with 1-by-1 and 2-by-2 diagonal blocks $D(k)$.
- $P(k)$ is a permutation matrix as defined by `ipiv(k)`.
- $U(k)$ is a unit upper triangular matrix, such that if the diagonal block $D(k)$ is of order s ($s = 1$ or 2), then

$$U(k) = \begin{pmatrix} I & v & 0 \\ 0 & I & 0 \\ 0 & 0 & I \end{pmatrix} \begin{matrix} k-s \\ s \\ n-k \end{matrix}$$

$k-s \quad s \quad n-k$

If $s = 1$, $D(k)$ overwrites $A(k,k)$, and v overwrites $A(1:k-1,k)$.

If $s = 2$, the upper triangle of $D(k)$ overwrites $A(k-1,k-1)$, $A(k-1,k)$ and $A(k,k)$, and v overwrites $A(1:k-2,k-1:k)$.

If `uplo` = 'L', then $A = L * D * L'$, where

$$L = P(1) * L(1) * \dots * P(k) * L(k) * \dots,$$

that is, L is a product of terms $P(k) * L(k)$, where

- k increases from 1 to n in steps of 1 and 2.
- D is a block diagonal matrix with 1-by-1 and 2-by-2 diagonal blocks $D(k)$.
- $P(k)$ is a permutation matrix as defined by `ipiv(k)`.
- $L(k)$ is a unit lower triangular matrix, such that if the diagonal block $D(k)$ is of order s ($s = 1$ or 2), then

$$L(k) = \begin{pmatrix} I & 0 & 0 \\ 0 & I & 0 \\ 0 & v & I \end{pmatrix} \begin{matrix} k-1 \\ s \\ n-k-s+1 \end{matrix}$$

$k-1 \quad s \quad n-k-s+1$

If $s = 1$, $D(k)$ overwrites $A(k,k)$, and v overwrites $A(k+1:n,k)$.

If $s = 2$, the lower triangle of $D(k)$ overwrites $A(k,k)$, $A(k+1,k)$, and $A(k+1,k+1)$, and v overwrites $A(k+2:n,k:k+1)$.

?hetrf

Computes the Bunch-Kaufman factorization of a complex Hermitian matrix.

Syntax

```
call chetrf( uplo, n, a, lda, ipiv, work, lwork, info )
call zhetrf( uplo, n, a, lda, ipiv, work, lwork, info )
call hetrf( a [, uplo] [, ipiv] [, info] )
```

Include Files

- `mk1.fi`, `lapack.f90`

Description

The routine computes the factorization of a complex Hermitian matrix A using the Bunch-Kaufman diagonal pivoting method:

```
if uplo='U',  $A = U * D * U^H$ 
if uplo='L',  $A = L * D * L^H$ ,
```

where A is the input matrix, U and L are products of permutation and triangular matrices with unit diagonal (upper triangular for U and lower triangular for L), and D is a Hermitian block-diagonal matrix with 1-by-1 and 2-by-2 diagonal blocks. U and L have 2-by-2 unit diagonal blocks corresponding to the 2-by-2 blocks of D .

NOTE

This routine supports the Progress Routine feature. See [Progress Routines](#) section for details.

Input Parameters

uplo

CHARACTER*1. Must be 'U' or 'L'.

Indicates whether the upper or lower triangular part of A is stored and how A is factored:

If *uplo* = 'U', the array *a* stores the upper triangular part of the matrix A , and A is factored as $U * D * U^H$.

If *uplo* = 'L', the array *a* stores the lower triangular part of the matrix *A*, and *A* is factored as $L^*D^*L^H$.

n INTEGER. The order of matrix *A*; $n \geq 0$.

a, *work* COMPLEX for chetrf

DOUBLE COMPLEX for zhetrf.

Arrays, size (*lda*, *), *work*(*).

The array *a* contains the upper or the lower triangular part of the matrix *A* (see *uplo*). The second dimension of *a* must be at least $\max(1, n)$.

work(*) is a workspace array of dimension at least $\max(1, lwork)$.

lda INTEGER. The leading dimension of *a*; at least $\max(1, n)$.

lwork INTEGER. The size of the *work* array ($lwork \geq n$).

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

See [Application Notes](#) for the suggested value of *lwork*.

Output Parameters

a The upper or lower triangular part of *a* is overwritten by details of the block-diagonal matrix *D* and the multipliers used to obtain the factor *U* (or *L*).

work(1) If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

ipiv INTEGER.

Array, size at least $\max(1, n)$. Contains details of the interchanges and the block structure of *D*. If *ipiv*(*i*) = *k* > 0, then *d_{ii}* is a 1-by-1 block, and the *i*-th row and column of *A* was interchanged with the *k*-th row and column.

If *uplo* = 'U' and *ipiv*(*i*) = *ipiv*(*i*-1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*-1, and (*i*-1)-th row and column of *A* was interchanged with the *m*-th row and column.

If *uplo* = 'L' and *ipiv*(*i*) = *ipiv*(*i*+1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*+1, and (*i*+1)-th row and column of *A* was interchanged with the *m*-th row and column.

info INTEGER. If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, *d_{ii}* is 0. The factorization has been completed, but *D* is exactly singular. Division by 0 will occur if you use *D* for solving a system of linear equations.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `hetrf` interface are as follows:

<code>a</code>	holds the matrix A of size (n, n)
<code>ipiv</code>	holds the vector of length n
<code>uplo</code>	must be 'U' or 'L'. The default value is 'U'.

Application Notes

This routine is suitable for Hermitian matrices that are not known to be positive-definite. If A is in fact positive-definite, the routine does not perform interchanges, and no 2-by-2 diagonal blocks occur in D .

For better performance, try using $lwork = n * blocksize$, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set $lwork = -1$.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value ($work(1)$) for subsequent runs.

If you set $lwork = -1$, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The 2-by-2 unit diagonal blocks and the unit diagonal elements of U and L are not stored. The remaining elements of U and L are stored in the corresponding columns of the array *a*, but additional row interchanges are required to recover U or L explicitly (which is seldom necessary).

If $ipiv(i) = i$ for all $i = 1 \dots n$, then all off-diagonal elements of U (L) are stored explicitly in the corresponding elements of the array *a*.

If $uplo = 'U'$, the computed factors U and D are the exact factors of a perturbed matrix $A + E$, where

$$\|E\| \leq c(n) \varepsilon P \|U\| \|D\| \|U^T\| P^T$$

$c(n)$ is a modest linear function of n , and ε is the machine precision.

A similar estimate holds for the computed L and D when $uplo = 'L'$.

The total number of floating-point operations is approximately $(4/3)n^3$.

After calling this routine, you can call the following routines:

<code>?hetrs</code>	to solve $A * X = B$
<code>?hecon</code>	to estimate the condition number of A
<code>?hetri</code>	to compute the inverse of A .

<i>lda</i>	<p>INTEGER. The leading dimension of a; at least $\max(1, n)$.</p>

lwork INTEGER. The size of the *work* array ($lwork \geq n$).
 The length of *work*. $lwork \geq 1$. For best performance $lwork \geq n * nb$, where *nb* is the block size returned by [ilaenv](#).
 If $lwork = -1$, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by [xerbla](#).

Output Parameters

a The block diagonal matrix *D* and the multipliers used to obtain the factor *U* or *L* (see Application Notes for further details).

work(1) If $info = 0$, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

ipiv INTEGER.
 Array, size at least $\max(1, n)$. Contains details of the interchanges and the block structure of *D*.

- If $uplo = 'U'$:
 If $ipiv(k) > 0$, then rows and columns *k* and $ipiv(k)$ were interchanged and $D_{k,k}$ is a 1-by-1 diagonal block.
 If $ipiv(k) < 0$ and $ipiv(k - 1) < 0$, then rows and columns *k* and $-ipiv(k)$ were interchanged and rows and columns *k* - 1 and $-ipiv(k - 1)$ were interchanged, $D_{k-1:k,k-1:k}$ is a 2-by-2 diagonal block.
- If $uplo = 'L'$:
 If $ipiv(k) > 0$, then rows and columns *k* and $ipiv(k)$ were interchanged and $D_{k,k}$ is a 1-by-1 diagonal block.
 If $ipiv(k) < 0$ and $ipiv(k + 1) < 0$, then rows and columns *k* and $-ipiv(k)$ were interchanged and rows and columns *k* + 1 and $-ipiv(k + 1)$ were interchanged, $D_{k:k+1,k:k+1}$ is a 2-by-2 diagonal block.

info INTEGER. If $info = 0$, the execution is successful.
 If $info = -i$, the *i*-th parameter had an illegal value.
 If $info = i$, D_{ii} is exactly 0. The factorization has been completed, but the block diagonal matrix *D* is exactly singular, and division by 0 will occur if you use *D* for solving a system of linear equations.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `hetrf_rook` interface are as follows:

<i>a</i>	holds the matrix <i>A</i> of size (<i>n</i> , <i>n</i>)
<i>ipiv</i>	holds the vector of length <i>n</i>
<i>uplo</i>	must be 'U' or 'L'. The default value is 'U'.

Application Notes

If *uplo* = 'U', then $A = U * D * U^H$, where

$$U = P(n) * U(n) * \dots * P(k) * U(k) * \dots,$$

i.e., *U* is a product of terms $P(k) * U(k)$, where *k* decreases from *n* to 1 in steps of 1 or 2, and *D* is a block diagonal matrix with 1-by-1 and 2-by-2 diagonal blocks $D(k)$. $P(k)$ is a permutation matrix as defined by *ipiv*(*k*), and $U(k)$ is a unit upper triangular matrix, such that if the diagonal block $D(k)$ is of order *s* (*s* = 1 or 2), then

$$\begin{pmatrix} I & v & 0 \\ 0 & 0 & I \end{pmatrix}_{n-k}^{k-s} U(k) = \begin{pmatrix} 0 & I & 0 \\ k-s & s & n-k \end{pmatrix}$$

If *s* = 1, $D(k)$ overwrites $A(k,k)$, and *v* overwrites $A(1:k-1,k)$.

If *s* = 2, the upper triangle of $D(k)$ overwrites $A(k-1,k-1)$, $A(k-1,k)$, and $A(k,k)$, and *v* overwrites $A(1:k-2,k-1:k)$.

If *uplo* = 'L', then $A = L * D * L^H$, where

$$L = P(1) * L(1) * \dots * P(k) * L(k) * \dots,$$

i.e., *L* is a product of terms $P(k) * L(k)$, where *k* increases from 1 to *n* in steps of 1 or 2, and *D* is a block diagonal matrix with 1-by-1 and 2-by-2 diagonal blocks $D(k)$. $P(k)$ is a permutation matrix as defined by *ipiv*(*k*), and $L(k)$ is a unit lower triangular matrix, such that if the diagonal block $D(k)$ is of order *s* (*s* = 1 or 2), then

$$L(k) = \begin{pmatrix} I & 0 & 0 \\ 0 & I & 0 \\ 0 & vI & \end{pmatrix}_{k-1}^{k-1} \begin{pmatrix} k-1 \\ s \\ n-k-s+1 \end{pmatrix}$$

If *s* = 1, $D(k)$ overwrites $A(k,k)$, and *v* overwrites $A(k+1:n,k)$.

If *s* = 2, the lower triangle of $D(k)$ overwrites $A(k,k)$, $A(k+1,k)$, and $A(k+1,k+1)$, and *v* overwrites $A(k+2:n,k:k+1)$.

If $uplo = 'U'$ and $ipiv(i) = ipiv(i-1) = -m < 0$, then D has a 2-by-2 block in rows/columns i and $i-1$, and $(i-1)$ -th row and column of A was interchanged with the m -th row and column.

If $uplo = 'L'$ and $ipiv(i) = ipiv(i+1) = -m < 0$, then D has a 2-by-2 block in rows/columns i and $i+1$, and $(i+1)$ -th row and column of A was interchanged with the m -th row and column.

info

INTEGER. If $info = 0$, the execution is successful.

If $info = -i$, the i -th parameter had an illegal value.

If $info = i$, d_{ii} is 0. The factorization has been completed, but D is exactly singular. Division by 0 will occur if you use D for solving a system of linear equations.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `spturf` interface are as follows:

<i>ap</i>	Holds the array A of size $(n * (n+1) / 2)$.
<i>ipiv</i>	Holds the vector of length n .
<i>uplo</i>	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The 2-by-2 unit diagonal blocks and the unit diagonal elements of U and L are not stored. The remaining elements of U and L overwrite elements of the corresponding columns of the array *ap*, but additional row interchanges are required to recover U or L explicitly (which is seldom necessary).

If $ipiv(i) = i$ for all $i = 1 \dots n$, then all off-diagonal elements of U (L) are stored explicitly in packed form.

If $uplo = 'U'$, the computed factors U and D are the exact factors of a perturbed matrix $A + E$, where

$$|E| \leq c(n) \varepsilon P |U| |D| |U^T| P^T$$

$c(n)$ is a modest linear function of n , and ε is the machine precision. A similar estimate holds for the computed L and D when $uplo = 'L'$.

The total number of floating-point operations is approximately $(1/3) n^3$ for real flavors or $(4/3) n^3$ for complex flavors.

After calling this routine, you can call the following routines:

<code>?spturs</code>	to solve $A * X = B$
<code>?spcon</code>	to estimate the condition number of A
<code>?sptri</code>	to compute the inverse of A .

?hptrf

Computes the Bunch-Kaufman factorization of a complex Hermitian matrix using packed storage.

Syntax

```
call chptrf( uplo, n, ap, ipiv, info )
call zhptrf( uplo, n, ap, ipiv, info )
call hptrf( ap [,uplo] [,ipiv] [,info] )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes the factorization of a complex Hermitian packed matrix A using the Bunch-Kaufman diagonal pivoting method:

if $uplo='U'$, $A = U^* D U^H$
 if $uplo='L'$, $A = L^* D L^H$,

where A is the input matrix, U and L are products of permutation and triangular matrices with unit diagonal (upper triangular for U and lower triangular for L), and D is a Hermitian block-diagonal matrix with 1-by-1 and 2-by-2 diagonal blocks. U and L have 2-by-2 unit diagonal blocks corresponding to the 2-by-2 blocks of D .

NOTE

This routine supports the Progress Routine feature. See [Progress Function](#) section for details.

Input Parameters

<i>uplo</i>	<p>CHARACTER*1. Must be 'U' or 'L'.</p> <p>Indicates whether the upper or lower triangular part of A is packed and how A is factored:</p> <p>If $uplo = 'U'$, the array ap stores the upper triangular part of the matrix A, and A is factored as $U^* D U^H$.</p> <p>If $uplo = 'L'$, the array ap stores the lower triangular part of the matrix A, and A is factored as $L^* D L^H$.</p>
<i>n</i>	<p>INTEGER. The order of matrix A; $n \geq 0$.</p>
<i>ap</i>	<p>COMPLEX for chptrf</p> <p>DOUBLE COMPLEX for zhptrf.</p> <p>Array, size at least $\max(1, n(n+1)/2)$. The array ap contains the upper or the lower triangular part of the matrix A (as specified by <i>uplo</i>) in <i>packed storage</i> (see Matrix Storage Schemes).</p>

Output Parameters

<i>ap</i>	The upper or lower triangle of A (as specified by <i>uplo</i>) is overwritten by details of the block-diagonal matrix D and the multipliers used to obtain the factor U (or L).
<i>ipiv</i>	<p>INTEGER.</p> <p>Array, size at least $\max(1, n)$. Contains details of the interchanges and the block structure of D. If $ipiv(i) = k > 0$, then d_{ii} is a 1-by-1 block, and the i-th row and column of A was interchanged with the k-th row and column.</p> <p>If $uplo = 'U'$ and $ipiv(i) = ipiv(i-1) = -m < 0$, then D has a 2-by-2 block in rows/columns i and $i-1$, and $(i-1)$-th row and column of A was interchanged with the m-th row and column.</p> <p>If $uplo = 'L'$ and $ipiv(i) = ipiv(i+1) = -m < 0$, then D has a 2-by-2 block in rows/columns i and $i+1$, and $(i+1)$-th row and column of A was interchanged with the m-th row and column.</p>
<i>info</i>	<p>INTEGER. If $info = 0$, the execution is successful.</p> <p>If $info = -i$, the i-th parameter had an illegal value.</p> <p>If $info = i$, d_{ii} is 0. The factorization has been completed, but D is exactly singular. Division by 0 will occur if you use D for solving a system of linear equations.</p>

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `hptrf` interface are as follows:

<i>ap</i>	Holds the array A of size $(n*(n+1)/2)$.
<i>ipiv</i>	Holds the vector of length n .
<i>uplo</i>	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The 2-by-2 unit diagonal blocks and the unit diagonal elements of U and L are not stored. The remaining elements of U and L are stored in the array *ap*, but additional row interchanges are required to recover U or L explicitly (which is seldom necessary).

If $ipiv(i) = i$ for all $i = 1 \dots n$, then all off-diagonal elements of U (L) are stored explicitly in the corresponding elements of the array *a*.

If $uplo = 'U'$, the computed factors U and D are the exact factors of a perturbed matrix $A + E$, where

$$|E| \leq c(n) \varepsilon P |U| |D| |U^T| P^T$$

$c(n)$ is a modest linear function of n , and ε is the machine precision.

A similar estimate holds for the computed L and D when $uplo = 'L'$.

The total number of floating-point operations is approximately $(4/3)n^3$.

After calling this routine, you can call the following routines:

<code>?hptrs</code>	to solve $A * X = B$
<code>?hpcon</code>	to estimate the condition number of A
<code>?hptri</code>	to compute the inverse of A .

See Also[mkl_progress](#)[Matrix Storage Schemes](#)**[mkl_?spffrt2, mkl_?spffrtx](#)**

Computes the partial LDL^T factorization of a symmetric matrix using packed storage.

Syntax

```
call mkl_sspffrt2( ap, n, ncolm, work, work2 )
call mkl_dspffrt2( ap, n, ncolm, work, work2 )
call mkl_cspffrt2( ap, n, ncolm, work, work2 )
call mkl_zspffrt2( ap, n, ncolm, work, work2 )
call mkl_sspffrtx( ap, n, ncolm, work, work2 )
call mkl_dspffrtx( ap, n, ncolm, work, work2 )
call mkl_cspffrtx( ap, n, ncolm, work, work2 )
call mkl_zspffrtx( ap, n, ncolm, work, work2 )
```

Include Files

- `mkl.fi`

Description

The routine computes the partial factorization $A = LDL^T$, where L is a lower triangular matrix and D is a diagonal matrix.

CAUTION

The routine assumes that the matrix A is factorizable. The routine does not perform pivoting and does not handle diagonal elements which are zero, which cause the routine to produce incorrect results without any indication.

Consider the matrix $A = \begin{pmatrix} a & b^T \\ b & C \end{pmatrix}$, where a is the element in the first row and first column of A , b is a column vector of size $n - 1$ containing the elements from the second through n -th column of A , C is the lower-right square submatrix of A , and I is the identity matrix.

The `mkl_?spffrt2` routine performs $ncolm$ successive factorizations of the form

$$A = \begin{pmatrix} a & b^T \\ b & C \end{pmatrix} = \begin{pmatrix} a & 0 \\ b & I \end{pmatrix} \begin{pmatrix} a^{-1} & 0 \\ 0 & C - ba^{-1}b^T \end{pmatrix} \begin{pmatrix} a & b^T \\ 0 & I \end{pmatrix}.$$

The `mkl_?spffrtx` routine performs $ncolm$ successive factorizations of the form

$$A = \begin{pmatrix} a & b^T \\ b & C \end{pmatrix} = \begin{pmatrix} 1 & 0 \\ ba^{-1} & I \end{pmatrix} \begin{pmatrix} a & 0 \\ 0 & C - ba^{-1}b^T \end{pmatrix} \begin{pmatrix} 1 & (ba^{-1})^T \\ 0 & I \end{pmatrix}.$$

The approximate number of floating point operations performed by real flavors of these routines is $(1/6)*ncolm*(2*ncolm^2 - 6*ncolm*n + 3*ncolm + 6*n^2 - 6*n + 7)$.

The approximate number of floating point operations performed by complex flavors of these routines is $(1/3)*ncolm*(4*ncolm^2 - 12*ncolm*n + 9*ncolm + 12*n^2 - 18*n + 8)$.

Input Parameters

<i>ap</i>	<p>REAL for mkl_sspffrt2 and mkl_sspffrtx</p> <p>DOUBLE PRECISION for mkl_dspffrt2 and mkl_dspffrtx</p> <p>COMPLEX for mkl_cspffrt2 and mkl_cspffrtx</p> <p>DOUBLE COMPLEX for mkl_zspffrt2 and mkl_zspffrtx.</p> <p>Array, size at least $\max(1, n(n+1)/2)$. The array <i>ap</i> contains the lower triangular part of the matrix <i>A</i> in packed storage (see Matrix Storage Schemes for <i>uplo</i> = 'L').</p>
<i>n</i>	INTEGER. The order of matrix <i>A</i> ; $n \geq 0$.
<i>ncolm</i>	INTEGER. The number of columns to factor, $ncolm \leq n$.
<i>work, work2</i>	<p>REAL for mkl_sspffrt2 and mkl_sspffrtx</p> <p>DOUBLE PRECISION for mkl_dspffrt2 and mkl_dspffrtx</p> <p>COMPLEX for mkl_cspffrt2 and mkl_cspffrtx</p> <p>DOUBLE COMPLEX for mkl_zspffrt2 and mkl_zspffrtx.</p> <p>Workspace arrays, size of each at least <i>n</i>.</p>

Output Parameters

<i>ap</i>	Overwritten by the factor <i>L</i> . The first <i>ncolm</i> diagonal elements of the input matrix <i>A</i> are replaced with the diagonal elements of <i>D</i> . The subdiagonal elements of the first <i>ncolm</i> columns are replaced with the corresponding elements of <i>L</i> . The rest of the input array is updated as indicated in the Description section.
-----------	--

NOTE

Specifying $ncolm = n$ results in complete factorization $A = LDL^T$.

Routines for Solving Systems of Linear Equations

This section describes the LAPACK routines for solving systems of linear equations. Before calling most of these routines, you need to factorize the matrix of your system of equations (see [Routines for Matrix Factorization](#) in this chapter). However, the factorization is not necessary if your system of equations has a triangular matrix.

sgetrs dgetrs cgetrs zgetrs Reference

Solves a system of linear equations with an LU-factored square coefficient matrix, with multiple right-hand sides.

Syntax

```
call sgetrs( trans, n, nrhs, a, lda, ipiv, b, ldb, info )
call dgetrs( trans, n, nrhs, a, lda, ipiv, b, ldb, info )
call cgetrs( trans, n, nrhs, a, lda, ipiv, b, ldb, info )
call zgetrs( trans, n, nrhs, a, lda, ipiv, b, ldb, info )
call getrs( a, ipiv, b [, trans] [,info] )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine solves for X the following systems of linear equations:

$A * X = B$	if $trans = 'N'$,
$A^T * X = B$	if $trans = 'T'$,
$A^H * X = B$	if $trans = 'C'$ (for complex matrices only).

Before calling this routine, you must call [?getrf](#) to compute the LU factorization of A .

Input Parameters

<i>trans</i>	CHARACTER*1. Must be 'N' or 'T' or 'C'. Indicates the form of the equations: If $trans = 'N'$, then $A * X = B$ is solved for X . If $trans = 'T'$, then $A^T * X = B$ is solved for X . If $trans = 'C'$, then $A^H * X = B$ is solved for X .
<i>n</i>	INTEGER. The order of A ; the number of rows in B ($n \geq 0$).
<i>nrhs</i>	INTEGER. The number of right-hand sides; $nrhs \geq 0$.
<i>a, b</i>	REAL for sgetrs DOUBLE PRECISION for dgetrs COMPLEX for cgetrs DOUBLE COMPLEX for zgetrs. Arrays: a (size lda by $*$), b (size ldb by $*$). The array a contains LU factorization of matrix A resulting from the call of ?getrf . The array b contains the matrix B whose columns are the right-hand sides for the systems of equations.

The second dimension of a must be at least $\max(1, n)$ and the second dimension of b at least $\max(1, nrhs)$.

lda INTEGER. The leading dimension of a ; $lda \geq \max(1, n)$.

ldb INTEGER. The leading dimension of b ; $ldb \geq \max(1, n)$.

ipiv INTEGER.
Array, size at least $\max(1, n)$. The *ipiv* array, as returned by ?
[getrf](#).

Output Parameters

b Overwritten by the solution matrix X .

info INTEGER. If $info = 0$, the execution is successful.
If $info = -i$, the i -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `getrs` interface are as follows:

a Holds the matrix A of size (n, n) .

b Holds the matrix B of size $(n, nrhs)$.

ipiv Holds the vector of length n .

trans Must be 'N', 'C', or 'T'. The default value is 'N'.

Application Notes

For each right-hand side b , the computed solution is the exact solution of a perturbed system of equations $(A + E)x = b$, where

$$\|E\| \leq c(n) \varepsilon P \|L\| \|U\|$$

$c(n)$ is a modest linear function of n , and ε is the machine precision.

If x_0 is the true solution, the computed solution x satisfies this error bound:

$$\begin{array}{ccccccc} & | & | & \dots & | & \dots & \\ \dots & \dots & \dots & \dots & \dots & \dots & \dots \\ & & & & | & | & \end{array}$$

where $\text{cond}(A, x) = \frac{\|A^{-1}\| \|A\| \|x\|_{\infty}}{\|x\|_{\infty}} \leq \|A^{-1}\|_{\infty} \|A\|_{\infty} = \kappa_{\infty}(A)$.

Note that $\text{cond}(A, x)$ can be much smaller than $\kappa_{\infty}(A)$; the condition number of A^T and A^H might or might not be equal to $\kappa_{\infty}(A)$.

The approximate number of floating-point operations for one right-hand side vector b is $2n^2$ for real flavors and $8n^2$ for complex flavors.

To estimate the condition number $\kappa_{\infty}(A)$, call `?gecon`.

To refine the solution and estimate the error, call `?gerfs`.

Matrix Storage Schemes

?gbtrs

Solves a system of linear equations with an LU-factored band coefficient matrix, with multiple right-hand sides.

Syntax

```
call sgbtrs( trans, n, kl, ku, nrhs, ab, ldab, ipiv, b, ldb, info )
call dgbtrs( trans, n, kl, ku, nrhs, ab, ldab, ipiv, b, ldb, info )
call cgbtrs( trans, n, kl, ku, nrhs, ab, ldab, ipiv, b, ldb, info )
call zgbtrs( trans, n, kl, ku, nrhs, ab, ldab, ipiv, b, ldb, info )
call gbtrs( ab, b, ipiv, [, kl] [, trans] [, info] )
```

Include Files

- `mk1.fi`, `lapack.f90`

Description

The routine solves for X the following systems of linear equations:

$A * X = B$	if <code>trans = 'N'</code> ,
$A^T * X = B$	if <code>trans = 'T'</code> ,
$A^H * X = B$	if <code>trans = 'C'</code> (for complex matrices only).

Here A is an LU -factored general band matrix of order n with kl non-zero subdiagonals and ku nonzero superdiagonals. Before calling this routine, call `?gbtrf` to compute the LU factorization of A .

Input Parameters

<code>trans</code>	CHARACTER*1. Must be 'N' or 'T' or 'C'.
<code>n</code>	INTEGER. The order of A ; the number of rows in B ; $n \geq 0$.
<code>kl</code>	INTEGER. The number of subdiagonals within the band of A ; $kl \geq 0$.
<code>ku</code>	INTEGER. The number of superdiagonals within the band of A ; $ku \geq 0$.
<code>nrhs</code>	INTEGER. The number of right-hand sides; $nrhs \geq 0$.
<code>ab, b</code>	REAL for <code>sgbtrs</code> DOUBLE PRECISION for <code>dgbtrs</code> COMPLEX for <code>cgbtrs</code> DOUBLE COMPLEX for <code>zgbtrs</code> .

Arrays: $ab(ldab, *)$, $b(l db, *)$.

The array ab contains elements of the LU factors of the matrix A as returned by [gbtrf](#). The second dimension of ab must be at least $\max(1, n)$.

The array b contains the matrix B whose columns are the right-hand sides for the systems of equations. The second dimension of b at least $\max(1, nrhs)$.

$ldab$

INTEGER. The leading dimension of the array ab ; $ldab \geq 2*kl + ku + 1$.

$l db$

INTEGER. The leading dimension of b ; $l db \geq \max(1, n)$.

$ipiv$

INTEGER. Array, size at least $\max(1, n)$. The $ipiv$ array, as returned by [?gbtrf](#).

Output Parameters

b

Overwritten by the solution matrix X .

$info$

INTEGER. If $info=0$, the execution is successful.

If $info = -i$, the i -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `gbtrs` interface are as follows:

ab

Holds the array A of size $(2*kl+ku+1, n)$.

b

Holds the matrix B of size $(n, nrhs)$.

$ipiv$

Holds the vector of length $\min(m, n)$.

kl

If omitted, assumed $kl = ku$.

ku

Restored as $lda-2*kl-1$.

$trans$

Must be 'N', 'C', or 'T'. The default value is 'N'.

Application Notes

For each right-hand side b , the computed solution is the exact solution of a perturbed system of equations $(A + E)x = b$, where

$$|E| \leq c(kl + ku + 1)\epsilon P|L||U|$$

$c(k)$ is a modest linear function of k , and ϵ is the machine precision.

If x_0 is the true solution, the computed solution x satisfies this error bound:

where $\text{cond}(A, x) = \| |A^{-1}| |A| |x| \|_{\infty} / \|x\|_{\infty} \leq \| |A^{-1}| \|_{\infty} \| |A| \|_{\infty} = \kappa_{\infty}(A)$.

Note that $\text{cond}(A, x)$ can be much smaller than $\kappa_{\infty}(A)$; the condition number of A^T and A^H might or might not be equal to $\kappa_{\infty}(A)$.

The approximate number of floating-point operations for one right-hand side vector is $2n(ku + 2kl)$ for real flavors. The number of operations for complex flavors is 4 times greater. All these estimates assume that kl and ku are much less than $\min(m, n)$.

To estimate the condition number $\kappa_{\infty}(A)$, call [?gbcon](#).

To refine the solution and estimate the error, call [?gbrfs](#).

$A^H * X = B$	if $trans = 'C'$ (for complex matrices only).

Before calling this routine, you must call [?gttrf](#) to compute the LU factorization of A .

Input Parameters

trans CHARACTER*1. Must be 'N' or 'T' or 'C'.
Indicates the form of the equations:
If $trans = 'N'$, then $A * X = B$ is solved for X .

If $trans = 'T'$, then $A^T * X = B$ is solved for X .

If $trans = 'C'$, then $A^H * X = B$ is solved for X .

n

INTEGER. The order of A ; $n \geq 0$.

$nrhs$

INTEGER. The number of right-hand sides, that is, the number of columns in B ; $nrhs \geq 0$.

$dl, d, du, du2, b$

REAL for `sgttrs`

DOUBLE PRECISION for `dgttrs`

COMPLEX for `cgttrs`

DOUBLE COMPLEX for `zgttrs`.

Arrays: $dl(n-1)$, $d(n)$, $du(n-1)$, $du2(n-2)$, $b(lmb, nrhs)$.

The array dl contains the $(n-1)$ multipliers that define the matrix L from the LU factorization of A .

The array d contains the n diagonal elements of the upper triangular matrix U from the LU factorization of A .

The array du contains the $(n-1)$ elements of the first superdiagonal of U .

The array $du2$ contains the $(n-2)$ elements of the second superdiagonal of U .

The array b contains the matrix B whose columns are the right-hand sides for the systems of equations.

ldb

INTEGER. The leading dimension of b ; $ldb \geq \max(1, n)$.

$ipiv$

INTEGER. Array, size (n) . The $ipiv$ array, as returned by [?gttrf](#).

Output Parameters

b

Overwritten by the solution matrix X .

$info$

INTEGER. If $info=0$, the execution is successful.

If $info = -i$, the i -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `gttrs` interface are as follows:

dl

Holds the vector of length $(n-1)$.

d

Holds the vector of length n .

du

Holds the vector of length $(n-1)$.

$du2$

Holds the vector of length $(n-2)$.

<i>b</i>	Holds the matrix <i>B</i> of size (<i>n</i> , <i>nrhs</i>).
<i>ipiv</i>	Holds the vector of length <i>n</i> .
<i>trans</i>	Must be 'N', 'C', or 'T'. The default value is 'N'.

Application Notes

For each right-hand side *b*, the computed solution is the exact solution of a perturbed system of equations $(A + E)x = b$, where

$$|E| \leq c(n) \varepsilon P |L| |U|$$

$c(n)$ is a modest linear function of *n*, and ε is the machine precision.

If x_0 is the true solution, the computed solution *x* satisfies this error bound:

$$\|x - x_0\|_\infty \leq \text{cond}(A, x) \|x\|_\infty \varepsilon$$

where $\text{cond}(A, x) = \|A^{-1}\|_\infty \|A\|_\infty \|x\|_\infty / \|x\|_\infty \leq \|A^{-1}\|_\infty \|A\|_\infty = \kappa_\infty(A)$.

Note that $\text{cond}(A, x)$ can be much smaller than $\kappa_\infty(A)$; the condition number of A^T and A^H might or might not be equal to $\kappa_\infty(A)$.

The approximate number of floating-point operations for one right-hand side vector *b* is $7n$ (including *n* divisions) for real flavors and $34n$ (including $2n$ divisions) for complex flavors.

To estimate the condition number $\kappa_\infty(A)$, call [?gtcon](#).

To refine the solution and estimate the error, call [?gtrfs](#).

```

Include Files

- mkl.fi, lapack.f90

Description

The routine solves for X the system of linear equations $A \cdot X = B$ with a symmetric positive-definite or, for complex data, Hermitian positive-definite matrix A , given the Cholesky factorization of A :

$$\begin{aligned} A &= U^T * U \text{ for real data, } A = U^H * U \text{ for complex data} && \text{if } uplo = 'U' \\ A &= L * L^T \text{ for real data, } A = L * L^H \text{ for complex data} && \text{if } uplo = 'L' \end{aligned}$$

where L is a lower triangular matrix and U is upper triangular. The system is solved with multiple right-hand sides stored in the columns of the matrix B .

Before calling this routine, you must call [potrf](#) to compute the Cholesky factorization of A .

Input Parameters

<i>uplo</i>	<p>CHARACTER*1. Must be 'U' or 'L'.</p> <p>Indicates how the input matrix A has been factored:</p> <p>If <i>uplo</i> = 'U', U is stored, where $A = U^T * U$ for real data, $A = U^H * U$ for complex data.</p> <p>If <i>uplo</i> = 'L', L is stored, where $A = L * L^T$ for real data, $A = L * L^H$ for complex data</p>
<i>n</i>	<p>INTEGER. The order of matrix A; $n \geq 0$.</p>
<i>nrhs</i>	<p>INTEGER. The number of right-hand sides ($nrhs \geq 0$).</p>
<i>a, b</i>	<p>REAL for spotrs</p> <p>DOUBLE PRECISION for dpotrs</p> <p>COMPLEX for cpotrs</p> <p>DOUBLE COMPLEX for zpotrs.</p> <p>Arrays: $a(lda, *)$, $b(ldb, *)$.</p> <p>The array a contains the factor U or L (see <i>uplo</i>) as returned by potrf. The second dimension of a must be at least $\max(1, n)$.</p> <p>The array b contains the matrix B whose columns are the right-hand sides for the systems of equations. The second dimension of b must be at least $\max(1, nrhs)$.</p>
<i>lda</i>	<p>INTEGER. The leading dimension of a; $lda \geq \max(1, n)$.</p>

ldb INTEGER. The leading dimension of *b*; $ldb \geq \max(1, n)$.

Output Parameters

b Overwritten by the solution matrix *X*.

info INTEGER. If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `potrs` interface are as follows:

a Holds the matrix *A* of size (*n*, *n*).

b Holds the matrix *B* of size (*n*, *nrhs*).

uplo Must be 'U' or 'L'. The default value is 'U'.

Application Notes

If *uplo* = 'U', the computed solution for each right-hand side *b* is the exact solution of a perturbed system of equations $(A + E)x = b$, where

$$|E| \leq c(n)\varepsilon \|U^H\| \|U\|$$

$c(n)$ is a modest linear function of *n*, and ε is the machine precision.

A similar estimate holds for *uplo* = 'L'. If x_0 is the true solution, the computed solution *x* satisfies this error bound:

$$\|x - x_0\|_\infty \leq \frac{\|A^{-1}\|_\infty \|A\|_\infty \|x\|_\infty}{\kappa_\infty(A)} + \frac{\|A^{-1}\|_\infty \|A\|_\infty}{\kappa_\infty(A)} \|b\|_\infty$$

where $\text{cond}(A, x) = \frac{\|A^{-1}\|_\infty \|A\|_\infty \|x\|_\infty}{\|x\|_\infty} \leq \|A^{-1}\|_\infty \|A\|_\infty = \kappa_\infty(A)$.

Note that $\text{cond}(A, x)$ can be much smaller than $\kappa_\infty(A)$. The approximate number of floating-point operations for one right-hand side vector *b* is $2n^2$ for real flavors and $8n^2$ for complex flavors.

To estimate the condition number $\kappa_\infty(A)$, call [?pocon](#).

To refine the solution and estimate the error, call [?porfs](#).

Matrix Storage Schemes

?pftsr

Solves a system of linear equations with a Cholesky-factored symmetric (Hermitian) positive-definite coefficient matrix using the Rectangular Full Packed (RFP) format.

Syntax

```
call spftrs( transr, uplo, n, nrhs, a, b, ldb, info )
call dpftrs( transr, uplo, n, nrhs, a, b, ldb, info )
call cpftrs( transr, uplo, n, nrhs, a, b, ldb, info )
call zpftrs( transr, uplo, n, nrhs, a, b, ldb, info )
```

Include Files

- `mkl.fi`, `lapack.f90`

Description

The routine solves a system of linear equations $A^*X = B$ with a symmetric positive-definite or, for complex data, Hermitian positive-definite matrix A using the Cholesky factorization of A :

$$\begin{aligned} A &= U^T * U \text{ for real data, } A = U^H * U \text{ for complex data} && \text{if } uplo = 'U' \\ A &= L * L^T \text{ for real data, } A = L * L^H \text{ for complex data} && \text{if } uplo = 'L' \end{aligned}$$

Before calling `?pftrs`, you must call `?pftfrf` to compute the Cholesky factorization of A . L stands for a lower triangular matrix and U for an upper triangular matrix.

The matrix A is in the Rectangular Full Packed (RFP) format. For the description of the RFP format, see [Matrix Storage Schemes](#).

Input Parameters

<i>transr</i>	<p>CHARACTER*1. Must be 'N', 'T' (for real data) or 'C' (for complex data).</p> <p>If <i>transr</i> = 'N', the untransposed factor of A is stored in RFP format.</p> <p>If <i>transr</i> = 'T', the transposed factor of A is stored in RFP format.</p> <p>If <i>transr</i> = 'C', the conjugate-transposed factor of A is stored in RFP format.</p>
<i>uplo</i>	<p>CHARACTER*1. Must be 'U' or 'L'.</p> <p>Indicates how the input matrix A has been factored:</p> <p>If <i>uplo</i> = 'U', U is stored, where $A = U^T * U$ for real data, $A = U^H * U$ for complex data.</p> <p>If <i>uplo</i> = 'L', L is stored, where $A = L * L^T$ for real data, $A = L * L^H$ for complex data</p>
<i>n</i>	<p>INTEGER. The order of the matrix A; $n \geq 0$.</p>
<i>nrhs</i>	<p>INTEGER. The number of right-hand sides, that is, the number of columns of the matrix B; $nrhs \geq 0$.</p>
<i>a, b</i>	<p>REAL for <code>spftrs</code></p> <p>DOUBLE PRECISION for <code>dpftrs</code></p> <p>COMPLEX for <code>cpftrs</code></p> <p>DOUBLE COMPLEX for <code>zpftrs</code>.</p> <p>Arrays: $a(n * (n + 1) / 2)$, $b(ldb, nrhs)$.</p>

The array *a* contains, in the RFP format, the factor *U* or *L* obtained by factorization of matrix *A*.

The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations.

ldb INTEGER. The leading dimension of *b*; $ldb \geq \max(1, n)$.

Output Parameters

b The solution matrix *X*.

info INTEGER. If *info*=0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.

Matrix Storage Schemes

?pptrs

Solves a system of linear equations with a packed Cholesky-factored symmetric (Hermitian) positive-definite coefficient matrix.

Syntax

```
call spptrs( uplo, n, nrhs, ap, b, ldb, info )
call dpptrs( uplo, n, nrhs, ap, b, ldb, info )
call cpptrs( uplo, n, nrhs, ap, b, ldb, info )
call zpptrs( uplo, n, nrhs, ap, b, ldb, info )
call pptrs( ap, b [,uplo] [,info] )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine solves for *X* the system of linear equations $A \cdot X = B$ with a packed symmetric positive-definite or, for complex data, Hermitian positive-definite matrix *A*, given the Cholesky factorization of *A*:

$$\begin{aligned} A &= U^T * U \text{ for real data, } A = U^H * U \text{ for complex data} && \text{if } uplo = 'U' \\ A &= L * L^T \text{ for real data, } A = L * L^H \text{ for complex data} && \text{if } uplo = 'L' \end{aligned}$$

where *L* is a lower triangular matrix and *U* is upper triangular. The system is solved with multiple right-hand sides stored in the columns of the matrix *B*.

Before calling this routine, you must call [?pptrf](#) to compute the Cholesky factorization of *A*.

Input Parameters

uplo CHARACTER*1. Must be 'U' or 'L'.

Indicates how the input matrix *A* has been factored:

If *uplo* = 'U', *U* is stored, where $A = U^T * U$ for real data, $A = U^H * U$ for complex data.

If $uplo = 'L'$, L is stored, where $A = L * L^T$ for real data, $A = L * L^H$ for complex data

n INTEGER. The order of matrix A ; $n \geq 0$.

$nrhs$ INTEGER. The number of right-hand sides ($nrhs \geq 0$).

ap, b REAL for `sptrs`
DOUBLE PRECISION for `dptrs`
COMPLEX for `cptrs`
DOUBLE COMPLEX for `zptrs`.

Arrays: $ap(*)$, $b(l_{db}, *)$

The size of ap must be at least $\max(1, n(n+1)/2)$.

The array ap contains the factor U or L , as specified by $uplo$, in *packed storage* (see [Matrix Storage Schemes](#)).

The array b contains the matrix B whose columns are the right-hand sides for the systems of equations. The second dimension of b must be at least $\max(1, nrhs)$.

ldb INTEGER. The leading dimension of b ; $ldb \geq \max(1, n)$.

Output Parameters

b Overwritten by the solution matrix X .

$info$ INTEGER. If $info = 0$, the execution is successful.
If $info = -i$, the i -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `pptrs` interface are as follows:

ap Holds the array A of size $(n * (n+1) / 2)$.
 b Holds the matrix B of size $(n, nrhs)$.
 $uplo$ Must be `'U'` or `'L'`. The default value is `'U'`.

Application Notes

If $uplo = 'U'$, the computed solution for each right-hand side b is the exact solution of a perturbed system of equations $(A + E)x = b$, where

$$|E| \leq c(n)\varepsilon |U^H| |U|$$

$c(n)$ is a modest linear function of n , and ε is the machine precision.

A similar estimate holds for $uplo = 'L'$.

If x_0 is the true solution, the computed solution x satisfies this error bound:

where $\text{cond}(A, x) = \| |A^{-1}| |A| |x| \|_{\infty} / \|x\|_{\infty} \leq \|A^{-1}\|_{\infty} \|A\|_{\infty} = \kappa_{\infty}(A)$.

Note that $\text{cond}(A, x)$ can be much smaller than $\kappa_{\infty}(A)$.

The approximate number of floating-point operations for one right-hand side vector b is $2n^2$ for real flavors and $8n^2$ for complex flavors.

To estimate the condition number $\kappa_{\infty}(A)$, call [?ppcon](#).

To refine the solution and estimate the error, call [?pprfs](#).

?pbtrs

Solves a system of linear equations with a Cholesky-factored symmetric (Hermitian) positive-definite band coefficient matrix.

Syntax

```
call spbtrs( uplo, n, kd, nrhs, ab, ldab, b, ldb, info )
call dpbtrs( uplo, n, kd, nrhs, ab, ldab, b, ldb, info )
call cpbtrs( uplo, n, kd, nrhs, ab, ldab, b, ldb, info )
call zpbtrs( uplo, n, kd, nrhs, ab, ldab, b, ldb, info )
call pbtrs( ab, b [,uplo] [,info] )
```

Include Files

- `mkl.fi`, `lapack.f90`

Description

The routine solves for real data a system of linear equations $A * X = B$ with a symmetric positive-definite or, for complex data, Hermitian positive-definite *band* matrix A , given the Cholesky factorization of A :

$$\begin{aligned} A &= U^T * U \text{ for real data, } A = U^H * U \text{ for complex data} && \text{if } uplo = 'U' \\ A &= L * L^T \text{ for real data, } A = L * L^H \text{ for complex data} && \text{if } uplo = 'L' \end{aligned}$$

where L is a lower triangular matrix and U is upper triangular. The system is solved with multiple right-hand sides stored in the columns of the matrix B .

Before calling this routine, you must call [?pbtrf](#) to compute the Cholesky factorization of A in the band storage form.

Input Parameters

`uplo` CHARACTER*1. Must be 'U' or 'L'.
Indicates how the input matrix A has been factored:

If `uplo = 'U'`, U is stored in ab , where $A = U^T * U$ for real matrices and $A = U^H * U$ for complex matrices.

If `uplo = 'L'`, L is stored in ab , where $A = L * L^T$ for real matrices and $A = L * L^H$ for complex matrices.

<code>n</code>	INTEGER. The order of matrix A ; $n \geq 0$.
<code>kd</code>	INTEGER. The number of superdiagonals or subdiagonals in the matrix A ; $kd \geq 0$.
<code>nrhs</code>	INTEGER. The number of right-hand sides; $nrhs \geq 0$.
<code>ab, b</code>	<p>REAL for <code>spbtrs</code></p> <p>DOUBLE PRECISION for <code>dpbtrs</code></p> <p>COMPLEX for <code>cpbtrs</code></p> <p>DOUBLE COMPLEX for <code>zpbtrs</code>.</p> <p>Arrays: $ab(ldab, *)$, $b(l db, *)$.</p> <p>The array ab contains the Cholesky factor, as returned by the factorization routine, in <i>band storage</i> form.</p> <p>The array b contains the matrix B whose columns are the right-hand sides for the systems of equations.</p> <p>The second dimension of ab must be at least $\max(1, n)$, and the second dimension of b at least $\max(1, nrhs)$.</p>
<code>ldab</code>	INTEGER. The leading dimension of the array ab ; $ldab \geq kd + 1$.
<code>ldb</code>	INTEGER. The leading dimension of b ; $ldb \geq \max(1, n)$.

Output Parameters

<code>b</code>	Overwritten by the solution matrix X .
<code>info</code>	<p>INTEGER. If <code>info=0</code>, the execution is successful.</p> <p>If <code>info = -i</code>, the i-th parameter had an illegal value.</p>

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `pbtrs` interface are as follows:

<code>ab</code>	Holds the array A of size $(kd+1, n)$.
<code>b</code>	Holds the matrix B of size $(n, nrhs)$.
<code>uplo</code>	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

For each right-hand side b , the computed solution is the exact solution of a perturbed system of equations $(A + E)x = b$, where

$$|E| \leq c(kd + 1)\varepsilon P|U^H||U| \text{ or } |E| \leq c(kd + 1)\varepsilon P|L^H||L|$$

$c(k)$ is a modest linear function of k , and ε is the machine precision.

If x_0 is the true solution, the computed solution x satisfies this error bound:

$$\frac{\|x - x_0\|_\infty}{\|x\|_\infty} \leq c(kd + 1) \text{cond}(A, x) \varepsilon$$

where $\text{cond}(A, x) = \| |A^{-1}| |A| |x| \|_\infty / \|x\|_\infty \leq \|A^{-1}\|_\infty \|A\|_\infty = \kappa_\infty(A)$.

Note that $\text{cond}(A, x)$ can be much smaller than $\kappa_\infty(A)$.

The approximate number of floating-point operations for one right-hand side vector is $4n*kd$ for real flavors and $16n*kd$ for complex flavors.

To estimate the condition number $\kappa_\infty(A)$, call [?pbcon](#).

To refine the solution and estimate the error, call [?pbrfs](#).

call pttrs( d, e, b [,uplo] [,info] )
```

Include Files

- `mk1.fi`, `lapack.f90`

Description

The routine solves for X a system of linear equations $A^*X = B$ with a symmetric (Hermitian) positive-definite tridiagonal matrix A . Before calling this routine, call [?pttrf](#) to compute the $L^*D^*L^T$ or $U^T^*D^*U$ for real data and the $L^*D^*L^H$ or $U^H^*D^*U$ factorization of A for complex data.

Input Parameters

uplo CHARACTER*1. Used for `cpttrs/zpttrs` only. Must be 'U' or 'L'.

Specifies whether the superdiagonal or the subdiagonal of the tridiagonal matrix A is stored and how A is factored:

If $uplo = 'U'$, the array e stores the conjugated values of the superdiagonal of U , and A is factored as $U^H * D * U$.

If $uplo = 'L'$, the array e stores the subdiagonal of L , and A is factored as $L * D * L^H$.

n	INTEGER. The order of A ; $n \geq 0$.
$nrhs$	INTEGER. The number of right-hand sides, that is, the number of columns of the matrix B ; $nrhs \geq 0$.
d	REAL for <code>spttrs</code> , <code>cpttrs</code> DOUBLE PRECISION for <code>dpttrs</code> , <code>zpttrs</code> . Array, dimension (n) . Contains the diagonal elements of the diagonal matrix D from the factorization computed by <code>?pttrf</code> .
e, b	REAL for <code>spttrs</code> DOUBLE PRECISION for <code>dpttrs</code> COMPLEX for <code>cpttrs</code> DOUBLE COMPLEX for <code>zpttrs</code> . Arrays: $e(n-1)$, $b(ldb, nrhs)$. The array e contains the $(n-1)$ sub-diagonal elements of the unit bidiagonal factor L or the conjugated values of the superdiagonal of U from the factorization computed by <code>?pttrf</code> (see $uplo$). The array b contains the matrix B whose columns are the right-hand sides for the systems of equations.
ldb	INTEGER. The leading dimension of b ; $ldb \geq \max(1, n)$.

Output Parameters

b	Overwritten by the solution matrix X .
$info$	INTEGER. If $info=0$, the execution is successful. If $info = -i$, the i -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `pttrs` interface are as follows:

d	Holds the vector of length n .
e	Holds the vector of length $(n-1)$.
b	Holds the matrix B of size $(n, nrhs)$.

uplo Used in complex flavors only. Must be 'U' or 'L'. The default value is 'U'.

Description

The routine solves for X the system of linear equations $A * X = B$ with a symmetric matrix A , given the Bunch-Kaufman factorization of A :

if $uplo='U'$, $A = U * D * U^T$

if $uplo='L'$, $A = L * D * L^T$,

where U and L are upper and lower triangular matrices with unit diagonal and D is a symmetric block-diagonal matrix. The system is solved with multiple right-hand sides stored in the columns of the matrix B . You must supply to this routine the factor U (or L) and the array $ipiv$ returned by the factorization routine ?[sytrf](#).

Input Parameters

uplo CHARACTER*1. Must be 'U' or 'L'.
Indicates how the input matrix A has been factored:
If $uplo = 'U'$, the array a stores the upper triangular factor U of the factorization $A = U * D * U^T$.
If $uplo = 'L'$, the array a stores the lower triangular factor L of the factorization $A = L * D * L^T$.

n INTEGER. The order of matrix A ; $n \geq 0$.

nrhs INTEGER. The number of right-hand sides; $nrhs \geq 0$.

ipiv INTEGER. Array, size at least $\max(1, n)$. The $ipiv$ array, as returned by ?[sytrf](#).

a, b REAL for ssytrs

DOUBLE PRECISION for dsytrs

COMPLEX for csytrs

DOUBLE COMPLEX for zsytrs.

Arrays: $a(lda, *)$, $b ldb, *)$.

The array a contains the factor U or L (see *uplo*). The second dimension of a must be at least $\max(1, n)$.

The array b contains the matrix B whose columns are the right-hand sides for the system of equations. The second dimension of b must be at least $\max(1, nrhs)$.

lda INTEGER. The leading dimension of a ; $lda \geq \max(1, n)$.

ldb INTEGER. The leading dimension of b ; $ldb \geq \max(1, n)$.

Output Parameters

b Overwritten by the solution matrix X .

info INTEGER. If *info*=0, the execution is successful.
If *info* = $-i$, the i -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `sytrs` interface are as follows:

a Holds the matrix A of size (n, n) .

b Holds the matrix B of size $(n, nrhs)$.

ipiv Holds the vector of length n .

uplo Must be 'U' or 'L'. The default value is 'U'.

Application Notes

For each right-hand side b , the computed solution is the exact solution of a perturbed system of equations $(A + E)x = b$, where

$$|E| \leq c(n) \varepsilon P |U| |D| |U^T| P^T \text{ or } |E| \leq c(n) \varepsilon P |L| |D| |U^T| P^T$$

$c(n)$ is a modest linear function of n , and ε is the machine precision.

If x_0 is the true solution, the computed solution x satisfies this error bound:

$$\frac{\|x - x_0\|_\infty}{\|x\|_\infty} \leq c(n) \text{cond}(A, x) \varepsilon$$

where $\text{cond}(A, x) = \frac{\|A^{-1}\| \|A\| \|x\|}{\|x\|} \leq \|A^{-1}\| \|A\| = \kappa_{\infty}(A)$.

Note that $\text{cond}(A, x)$ can be much smaller than $\kappa_{\infty}(A)$.

The total number of floating-point operations for one right-hand side vector is approximately $2n^2$ for real flavors or $8n^2$ for complex flavors.

To estimate the condition number $\kappa_{\infty}(A)$, call [?sycon](#).

To refine the solution and estimate the error, call [?sytrfs](#).

$nrhs$	<p>INTEGER. The number of right-hand sides; $nrhs \geq 0$.</p>
$ipiv$	<p>INTEGER.</p> <p>Array, size at least $\max(1, n)$.</p> <p>The $ipiv$ array, as returned by ?hetrf.</p>
a, b	<p>COMPLEX for <code>chetrs</code></p> <p>DOUBLE COMPLEX for <code>zhetsr</code>.</p> <p>Arrays: $a(lda, *)$, $b(l db, *)$.</p> <p>The array a contains the factor U or L (see $uplo$).</p> <p>The array b contains the matrix B whose columns are the right-hand sides for the system of equations.</p> <p>The second dimension of a must be at least $\max(1, n)$, the second dimension of b at least $\max(1, nrhs)$.</p>
lda	<p>INTEGER. The leading dimension of a; $lda \geq \max(1, n)$.</p>
ldb	<p>INTEGER. The leading dimension of b; $ldb \geq \max(1, nrhs)$.</p>

Output Parameters

b	Overwritten by the solution matrix X .
-----	--

info INTEGER. If *info*=0, the execution is successful.
 If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `hetrs` interface are as follows:

<i>a</i>	Holds the matrix <i>A</i> of size (<i>n</i> , <i>n</i>).
<i>b</i>	Holds the matrix <i>B</i> of size (<i>n</i> , <i>nrhs</i>).
<i>ipiv</i>	Holds the vector of length <i>n</i> .
<i>uplo</i>	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

For each right-hand side *b*, the computed solution is the exact solution of a perturbed system of equations $(A + E)x = b$, where

$$|E| \leq c(n) \varepsilon P |U| |D| |U^H| P^T \text{ or } |E| \leq c(n) \varepsilon P |L| |D| |L^H| P^T$$

$c(n)$ is a modest linear function of *n*, and ε is the machine precision.

If x_0 is the true solution, the computed solution *x* satisfies this error bound:

$$\frac{\|x - x_0\|_\infty}{\|x\|_\infty} \leq \frac{\|A^{-1}\|_\infty \|A\|_\infty \|x\|_\infty}{\|x\|_\infty} \leq \|A^{-1}\|_\infty \|A\|_\infty = \kappa_\infty(A).$$

where $\text{cond}(A, x) = \frac{\|A^{-1}\|_\infty \|A\|_\infty \|x\|_\infty}{\|x\|_\infty} \leq \|A^{-1}\|_\infty \|A\|_\infty = \kappa_\infty(A)$.

Note that $\text{cond}(A, x)$ can be much smaller than $\kappa_\infty(A)$.

The total number of floating-point operations for one right-hand side vector is approximately $8n^2$.

To estimate the condition number $\kappa_\infty(A)$, call [?hecon](#).

To refine the solution and estimate the error, call [?herfs](#).

call spttrs( ap, b, ipiv [, uplo] [,info] )
```

Include Files

- `mk1.fi`, `lapack.f90`

Description

The routine solves for X the system of linear equations $A * X = B$ with a symmetric matrix A , given the Bunch-Kaufman factorization of A :

if $uplo = 'U'$, $A = U * D * U^T$

if $uplo = 'L'$, $A = L * D * L^T$,

where U and L are upper and lower *packed* triangular matrices with unit diagonal and D is a symmetric block-diagonal matrix. The system is solved with multiple right-hand sides stored in the columns of the matrix B . You must supply the factor U (or L) and the array $ipiv$ returned by the factorization routine [?sptf](#).

Input Parameters

<i>uplo</i>	CHARACTER*1. Must be 'U' or 'L'. Indicates how the input matrix A has been factored: If $uplo = 'U'$, the array ap stores the packed factor U of the factorization $A = U * D * U^T$. If $uplo = 'L'$, the array ap stores the packed factor L of the factorization $A = L * D * L^T$.
<i>n</i>	INTEGER. The order of matrix A ; $n \geq 0$.
<i>nrhs</i>	INTEGER. The number of right-hand sides; $nrhs \geq 0$.
<i>ipiv</i>	INTEGER. Array, size at least $\max(1, n)$. The $ipiv$ array, as returned by ?sptf .
<i>ap</i>	REAL for <code>ssptrs</code> DOUBLE PRECISION for <code>dsptrs</code> COMPLEX for <code>csptrs</code> DOUBLE COMPLEX for <code>zsptrs</code> . The dimension of array ap must be at least $\max(1, n(n+1)/2)$. The array ap contains the factor U or L , as specified by $uplo$, in <i>packed storage</i> (see Matrix Storage Schemes).
<i>b</i>	REAL for <code>ssptrs</code> DOUBLE PRECISION for <code>dsptrs</code> COMPLEX for <code>csptrs</code> DOUBLE COMPLEX for <code>zsptrs</code> . The array $b(l_{db}, *)$ contains the matrix B whose columns are the right-hand sides for the system of equations. The second dimension of b must be at least $\max(1, nrhs)$.
<i>ldb</i>	INTEGER. The leading dimension of b ; $ldb \geq \max(1, n)$.

Output Parameters

<i>b</i>	Overwritten by the solution matrix <i>X</i> .
<i>info</i>	INTEGER. If <i>info</i> =0, the execution is successful. If <i>info</i> = - <i>i</i> , the <i>i</i> -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `spttrs` interface are as follows:

<i>ap</i>	Holds the array <i>A</i> of size $(n^*(n+1))/2$.
<i>b</i>	Holds the matrix <i>B</i> of size $(n, nrhs)$.
<i>ipiv</i>	Holds the vector of length <i>n</i> .
<i>uplo</i>	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

For each right-hand side *b*, the computed solution is the exact solution of a perturbed system of equations $(A + E)x = b$, where

$$|E| \leq c(n) \varepsilon P |U| |D| |U^T| P^T \text{ or } |E| \leq c(n) \varepsilon P |L| |D| |L^T| P^T$$

$c(n)$ is a modest linear function of *n*, and ε is the machine precision.

If x_0 is the true solution, the computed solution *x* satisfies this error bound:

$$\frac{\|x - x_0\|_\infty}{\|x\|_\infty} \leq c(n) \text{cond}(A, x) \varepsilon$$

where $\text{cond}(A, x) = \| |A^{-1}| |A| |x| \|_\infty / \|x\|_\infty \leq \|A^{-1}\|_\infty \|A\|_\infty = \kappa_\infty(A)$.

Note that $\text{cond}(A, x)$ can be much smaller than $\kappa_\infty(A)$.

The total number of floating-point operations for one right-hand side vector is approximately $2n^2$ for real flavors or $8n^2$ for complex flavors.

To estimate the condition number $\kappa_\infty(A)$, call `?spcon`.

To refine the solution and estimate the error, call `?sprfs`.

call ztrtrs( uplo, trans, diag, n, nrhs, a, lda, b, ldb, info )
call trtrs( a, b [,uplo] [, trans] [,diag] [,info] )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine solves for X the following systems of linear equations with a triangular matrix A , with multiple right-hand sides stored in B :

$A * X = B$	if $trans = 'N'$,
$A^T * X = B$	if $trans = 'T'$,
$A^H * X = B$	if $trans = 'C'$ (for complex matrices only).

Input Parameters

<i>uplo</i>	CHARACTER*1. Must be 'U' or 'L'. Indicates whether A is upper or lower triangular: If $uplo = 'U'$, then A is upper triangular. If $uplo = 'L'$, then A is lower triangular.
<i>trans</i>	CHARACTER*1. Must be 'N' or 'T' or 'C'. If $trans = 'N'$, then $A * X = B$ is solved for X . If $trans = 'T'$, then $A^T * X = B$ is solved for X . If $trans = 'C'$, then $A^H * X = B$ is solved for X .
<i>diag</i>	CHARACTER*1. Must be 'N' or 'U'. If $diag = 'N'$, then A is not a unit triangular matrix. If $diag = 'U'$, then A is unit triangular: diagonal elements of A are assumed to be 1 and not referenced in the array a .
<i>n</i>	INTEGER. The order of A ; the number of rows in B ; $n \geq 0$.
<i>nrhs</i>	INTEGER. The number of right-hand sides; $nrhs \geq 0$.
<i>a</i>	REAL for strtrs DOUBLE PRECISION for dtrtrs COMPLEX for ctrtrs DOUBLE COMPLEX for ztrtrs. The array $a(lda,*)$ contains the matrix A .

The second dimension of a must be at least $\max(1, n)$.

b

REAL for strtrs
DOUBLE PRECISION for dtrtrs
COMPLEX for ctrtrs
DOUBLE COMPLEX for ztrtrs.

The array $b(ldb, *)$ contains the matrix B whose columns are the right-hand sides for the systems of equations.

The second dimension of b at least $\max(1, nrhs)$.

lda

INTEGER. The leading dimension of a ; $lda \geq \max(1, n)$.

ldb

INTEGER. The leading dimension of b ; $ldb \geq \max(1, n)$.

Output Parameters

b

Overwritten by the solution matrix X .

$info$

INTEGER. If $info=0$, the execution is successful.
If $info = -i$, the i -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `trtrs` interface are as follows:

a

Stands for argument ap in FORTRAN 77 interface. Holds the matrix A of size $(n*(n+1)/2)$.

b

Holds the matrix B of size $(n, nrhs)$.

$uplo$

Must be 'U' or 'L'. The default value is 'U'.

$trans$

Must be 'N', 'C', or 'T'. The default value is 'N'.

$diag$

Must be 'N' or 'U'. The default value is 'N'.

Application Notes

For each right-hand side b , the computed solution is the exact solution of a perturbed system of equations $(A + E)x = b$, where

$$|E| \leq c(n)\varepsilon |A|$$

$c(n)$ is a modest linear function of n , and ε is the machine precision. If x_0 is the true solution, the computed solution x satisfies this error bound:

$$\frac{\|x - x_0\|_\infty}{\|x\|_\infty} \leq c(n) \operatorname{cond}(A, x) \varepsilon \text{ provided } c(n) \operatorname{cond}(A, x) \varepsilon < 1$$

where $\operatorname{cond}(A, x) = \| |A^{-1}| |A| |x| \|_\infty / \|x\|_\infty \leq \|A^{-1}\|_\infty \|A\|_\infty = \kappa_\infty(A)$.

Note that $\operatorname{cond}(A, x)$ can be much smaller than $\kappa_\infty(A)$; the condition number of A^T and A^H might or might not be equal to $\kappa_\infty(A)$.

The approximate number of floating-point operations for one right-hand side vector b is n^2 for real flavors and $4n^2$ for complex flavors.

To estimate the condition number $\kappa_\infty(A)$, call `?trcon`.

To estimate the error in the solution, call `?trrfs`.

Indicates whether A is upper or lower triangular:
If $uplo = 'U'$, then A is upper triangular.
If $uplo = 'L'$, then A is lower triangular.

<i>trans</i>	<p>CHARACTER*1. Must be 'N' or 'T' or 'C'.</p> <p>If <i>trans</i> = 'N', then $A * X = B$ is solved for X.</p> <p>If <i>trans</i> = 'T', then $A^T * X = B$ is solved for X.</p> <p>If <i>trans</i> = 'C', then $A^H * X = B$ is solved for X.</p>
<i>diag</i>	<p>CHARACTER*1. Must be 'N' or 'U'.</p> <p>If <i>diag</i> = 'N', then A is not a unit triangular matrix.</p> <p>If <i>diag</i> = 'U', then A is unit triangular: diagonal elements are assumed to be 1 and not referenced in the array <i>ap</i>.</p>
<i>n</i>	INTEGER. The order of A ; the number of rows in B ; $n \geq 0$.
<i>nrhs</i>	INTEGER. The number of right-hand sides; $nrhs \geq 0$.
<i>ap</i>	<p>REAL for <i>stptrs</i></p> <p>DOUBLE PRECISION for <i>dtptrs</i></p> <p>COMPLEX for <i>ctptrs</i></p> <p>DOUBLE COMPLEX for <i>ztptrs</i>.</p> <p>The dimension of array <i>ap</i>(*) must be at least $\max(1, n(n+1)/2)$. The array <i>ap</i> contains the matrix A in <i>packed storage</i> (see Matrix Storage Schemes).</p>
<i>b</i>	<p>REAL for <i>stptrs</i></p> <p>DOUBLE PRECISION for <i>dtptrs</i></p> <p>COMPLEX for <i>ctptrs</i></p> <p>DOUBLE COMPLEX for <i>ztptrs</i>.</p> <p>The array <i>b</i>(<i>ldb</i>,*) contains the matrix B whose columns are the right-hand sides for the system of equations.</p> <p>The second dimension of <i>b</i> must be at least $\max(1, nrhs)$.</p>
<i>ldb</i>	INTEGER. The leading dimension of <i>b</i> ; $ldb \geq \max(1, n)$.

Output Parameters

<i>b</i>	Overwritten by the solution matrix X .
<i>info</i>	<p>INTEGER. If <i>info</i>=0, the execution is successful.</p> <p>If <i>info</i> = -<i>i</i>, the <i>i</i>-th parameter had an illegal value.</p>

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine *tptrs* interface are as follows:

<i>ap</i>	Holds the array A of size $(n * (n+1) / 2)$.
-----------	---

<i>b</i>	Holds the matrix <i>B</i> of size (<i>n</i> , <i>nrhs</i>).
<i>uplo</i>	Must be 'U' or 'L'. The default value is 'U'.
<i>trans</i>	Must be 'N', 'C', or 'T'. The default value is 'N'.
<i>diag</i>	Must be 'N' or 'U'. The default value is 'N'.

Application Notes

For each right-hand side *b*, the computed solution is the exact solution of a perturbed system of equations $(A + E)x = b$, where

$$|E| \leq c(n)\varepsilon |A|$$

$c(n)$ is a modest linear function of *n*, and ε is the machine precision.

If x_0 is the true solution, the computed solution *x* satisfies this error bound:

$$\frac{\|x - x_0\|}{\|x\|} \leq \frac{\|A^{-1}\| \|A\| \|x\|}{\|x\|} \leq \frac{\|A^{-1}\| \|A\|}{\|x\|} \|x\| = \kappa_\infty(A) \frac{\|x\|}{\|x\|} = \kappa_\infty(A)$$

where $\text{cond}(A, x) = \frac{\|A^{-1}\| \|A\| \|x\|}{\|x\|} \leq \frac{\|A^{-1}\| \|A\|}{\|x\|} \|x\| = \kappa_\infty(A)$.

Note that $\text{cond}(A, x)$ can be much smaller than $\kappa_\infty(A)$; the condition number of A^T and A^H might or might not be equal to $\kappa_\infty(A)$.

The approximate number of floating-point operations for one right-hand side vector *b* is n^2 for real flavors and $4n^2$ for complex flavors.

To estimate the condition number $\kappa_\infty(A)$, call [?tpcon](#).

To estimate the error in the solution, call [?tprfs](#).

Matrix Storage Schemes

[?tbtrs](#)

Solves a system of linear equations with a band triangular coefficient matrix, with multiple right-hand sides.

Syntax

```
call stbtrs( uplo, trans, diag, n, kd, nrhs, ab, ldab, b, ldb, info )
call dtbtrs( uplo, trans, diag, n, kd, nrhs, ab, ldab, b, ldb, info )
call ctbtrs( uplo, trans, diag, n, kd, nrhs, ab, ldab, b, ldb, info )
call ztbtrs( uplo, trans, diag, n, kd, nrhs, ab, ldab, b, ldb, info )
call tbtrs( ab, b [,uplo] [, trans] [,diag] [,info] )
```

Include Files

- `mkl.fi`, `lapack.f90`

Description

The routine solves for X the following systems of linear equations with a band triangular matrix A , with multiple right-hand sides stored in B :

$$\begin{array}{ll}
 A * X = B & \text{if } trans = 'N', \\
 A^T * X = B & \text{if } trans = 'T', \\
 A^H * X = B & \text{if } trans = 'C' \text{ (for complex matrices only).}
 \end{array}$$

Input Parameters

<i>uplo</i>	<p>CHARACTER*1. Must be 'U' or 'L'.</p> <p>Indicates whether A is upper or lower triangular:</p> <p>If <i>uplo</i> = 'U', then A is upper triangular.</p> <p>If <i>uplo</i> = 'L', then A is lower triangular.</p>
<i>trans</i>	<p>CHARACTER*1. Must be 'N' or 'T' or 'C'.</p> <p>If <i>trans</i> = 'N', then $A * X = B$ is solved for X.</p> <p>If <i>trans</i> = 'T', then $A^T * X = B$ is solved for X.</p> <p>If <i>trans</i> = 'C', then $A^H * X = B$ is solved for X.</p>
<i>diag</i>	<p>CHARACTER*1. Must be 'N' or 'U'.</p> <p>If <i>diag</i> = 'N', then A is not a unit triangular matrix.</p> <p>If <i>diag</i> = 'U', then A is unit triangular: diagonal elements are assumed to be 1 and not referenced in the array <i>ab</i>.</p>
<i>n</i>	<p>INTEGER. The order of A; the number of rows in B; $n \geq 0$.</p>
<i>kd</i>	<p>INTEGER. The number of superdiagonals or subdiagonals in the matrix A; $kd \geq 0$.</p>
<i>nrhs</i>	<p>INTEGER. The number of right-hand sides; $nrhs \geq 0$.</p>
<i>ab</i>	<p>REAL for stbtrs</p> <p>DOUBLE PRECISION for dtbtrs</p> <p>COMPLEX for ctbtrs</p> <p>DOUBLE COMPLEX for ztbtrs.</p> <p>The array <i>ab</i>(<i>ldab</i>,*) contains the matrix A in <i>band storage</i> form.</p> <p>The second dimension of <i>ab</i> must be at least $\max(1, n)$.</p>
<i>b</i>	<p>REAL for stbtrs</p> <p>DOUBLE PRECISION for dtbtrs</p> <p>COMPLEX for ctbtrs</p> <p>DOUBLE COMPLEX for ztbtrs.</p>

The array $b(l_{db}, *)$ contains the matrix B whose columns are the right-hand sides for the systems of equations.

The second dimension of b at least $\max(1, nrhs)$.

$ldab$

INTEGER. The leading dimension of ab ; $ldab \geq kd + 1$.

ldb

INTEGER. The leading dimension of b ; $ldb \geq \max(1, n)$.

Output Parameters

b

Overwritten by the solution matrix X .

$info$

INTEGER. If $info=0$, the execution is successful.

If $info = -i$, the i -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `tbtrs` interface are as follows:

ab

Holds the array A of size $(kd+1, n)$

b

Holds the matrix B of size $(n, nrhs)$.

$uplo$

Must be 'U' or 'L'. The default value is 'U'.

$trans$

Must be 'N', 'C', or 'T'. The default value is 'N'.

$diag$

Must be 'N' or 'U'. The default value is 'N'.

Application Notes

For each right-hand side b , the computed solution is the exact solution of a perturbed system of equations $(A + E)x = b$, where

$$|E| \leq c(n)\varepsilon|A|$$

$c(n)$ is a modest linear function of n , and ε is the machine precision. If x_0 is the true solution, the computed solution x satisfies this error bound:

$$\|x - x_0\|_\infty \leq \|A^{-1}\|_\infty \|A\|_\infty \|x\|_\infty \leq \|A^{-1}\|_\infty \|A\|_\infty \|x\|_\infty = \kappa_\infty(A) \|x\|_\infty$$

where $\text{cond}(A, x) = \|A^{-1}\|_\infty \|A\|_\infty \|x\|_\infty / \|x\|_\infty \leq \|A^{-1}\|_\infty \|A\|_\infty = \kappa_\infty(A)$.

Note that $\text{cond}(A, x)$ can be much smaller than $\kappa_\infty(A)$; the condition number of A^T and A^H might or might not be equal to $\kappa_\infty(A)$.

The approximate number of floating-point operations for one right-hand side vector b is $2n \cdot kd$ for real flavors and $8n \cdot kd$ for complex flavors.

To estimate the condition number $\kappa_{\infty}(A)$, call `?tbcon`.

To estimate the error in the solution, call `?tbrfs`.

Routines for Estimating the Condition Number

This section describes the LAPACK routines for estimating the *condition number* of a matrix. The condition number is used for analyzing the errors in the solution of a system of linear equations (see [Error Analysis](#)). Since the condition number may be arbitrarily large when the matrix is nearly singular, the routines actually compute the *reciprocal* condition number.

?gecon

Estimates the reciprocal of the condition number of a general matrix in the 1-norm or the infinity-norm.

Syntax

```
call sgecon( norm, n, a, lda, anorm, rcond, work, iwork, info )
call dgecon( norm, n, a, lda, anorm, rcond, work, iwork, info )
call cgecon( norm, n, a, lda, anorm, rcond, work, rwork, info )
call zgecon( norm, n, a, lda, anorm, rcond, work, rwork, info )
call gecon( a, anorm, rcond [,norm] [,info] )
```

Include Files

- `mk1.fi`, `lapack.f90`

Description

The routine estimates the reciprocal of the condition number of a general matrix A in the 1-norm or infinity-norm:

$$\kappa_1(A) = \|A\|_1 \|A^{-1}\|_1 = \kappa_{\infty}(A^T) = \kappa_{\infty}(A^H)$$

$$\kappa_{\infty}(A) = \|A\|_{\infty} \|A^{-1}\|_{\infty} = \kappa_1(A^T) = \kappa_1(A^H).$$

An estimate is obtained for $\|A^{-1}\|$, and the reciprocal of the condition number is computed as $rcond = 1 / (\|A\| \|A^{-1}\|)$.

Before calling this routine:

- compute *anorm* (either $\|A\|_1 = \max_j \sum_i |a_{ij}|$ or $\|A\|_{\infty} = \max_i \sum_j |a_{ij}|$)
- call `?getrf` to compute the *LU* factorization of A .

Input Parameters

<i>norm</i>	CHARACTER*1. Must be '1' or 'O' or 'I'. If <i>norm</i> = '1' or 'O', then the routine estimates the condition number of matrix A in 1-norm. If <i>norm</i> = 'I', then the routine estimates the condition number of matrix A in infinity-norm.
<i>n</i>	INTEGER. The order of the matrix A ; $n \geq 0$.

<i>a, work</i>	<p>REAL for sgecon</p> <p>DOUBLE PRECISION for dgecon</p> <p>COMPLEX for cgecon</p> <p>DOUBLE COMPLEX for zgecon. Arrays: $a(lda, *)$, $work(*)$.</p> <p>The array <i>a</i> contains the <i>LU</i>-factored matrix <i>A</i>, as returned by ?getrf. The second dimension of <i>a</i> must be at least $\max(1, n)$. The array <i>work</i> is a workspace for the routine.</p> <p>The dimension of <i>work</i> must be at least $\max(1, 4*n)$ for real flavors and $\max(1, 2*n)$ for complex flavors.</p>
<i>anorm</i>	<p>REAL for single precision flavors.</p> <p>DOUBLE PRECISION for double precision flavors.</p> <p>The norm of the <i>original</i> matrix <i>A</i> (see Description).</p>
<i>lda</i>	INTEGER. The leading dimension of <i>a</i> ; $lda \geq \max(1, n)$.
<i>iwork</i>	INTEGER. Workspace array, size at least $\max(1, n)$.
<i>rwork</i>	<p>REAL for cgecon</p> <p>DOUBLE PRECISION for zgecon.</p> <p>Workspace array, size at least $\max(1, 2*n)$.</p>

Output Parameters

<i>rcond</i>	<p>REAL for single precision flavors.</p> <p>DOUBLE PRECISION for double precision flavors.</p> <p>An estimate of the reciprocal of the condition number. The routine sets $rcond = 0$ if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime <i>rcond</i> is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.</p>
<i>info</i>	<p>INTEGER. If $info=0$, the execution is successful.</p> <p>If $info = -i$, the <i>i</i>-th parameter had an illegal value.</p>

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `gecon` interface are as follows:

<i>a</i>	Holds the matrix <i>A</i> of size (n, n) .
<i>norm</i>	Must be '1', 'O', or 'I'. The default value is '1'.

Application Notes

The computed $rcond$ is never less than r (the reciprocal of the true condition number) and in practice is nearly always less than $10r$. A call to this routine involves solving a number of systems of linear equations $A*x = b$ or $A^H*x = b$; the number is usually 4 or 5 and never more than 11. Each solution requires approximately $2*n^2$ floating-point operations for real flavors and $8*n^2$ for complex flavors.

call zgtcon( norm, n, dl, d, du, du2, ipiv, anorm, rcond, work, info )
call gtcon( dl, d, du, du2, ipiv, anorm, rcond [,norm] [,info] )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine estimates the reciprocal of the condition number of a real or complex tridiagonal matrix *A* in the 1-norm or infinity-norm:

$$\kappa_1(A) = \|A\|_1 \|A^{-1}\|_1$$

$$\kappa_\infty(A) = \|A\|_\infty \|A^{-1}\|_\infty$$

An estimate is obtained for $\|A^{-1}\|$, and the reciprocal of the condition number is computed as $rcond = 1 / (\|A\| \|A^{-1}\|)$.

Before calling this routine:

- compute *anorm* (either $\|A\|_1 = \max_j \sum_i |a_{ij}|$ or $\|A\|_\infty = \max_i \sum_j |a_{ij}|$)
- call [?gttrf](#) to compute the *LU* factorization of *A*.

Input Parameters

norm CHARACTER*1. Must be '1' or 'O' or 'I'.

If *norm* = '1' or 'O', then the routine estimates the condition number of matrix *A* in 1-norm.

If *norm* = 'I', then the routine estimates the condition number of matrix *A* in infinity-norm.

n

INTEGER. The order of the matrix *A*; $n \geq 0$.

dl,d,du,du2

REAL for sgtcon

DOUBLE PRECISION for dgtcon

COMPLEX for cgtcon

DOUBLE COMPLEX for zgtcon.

Arrays: *dl*(*n* - 1), *d*(*n*), *du*(*n* - 1), *du2*(*n* - 2).

The array *dl* contains the (*n* - 1) multipliers that define the matrix *L* from the *LU* factorization of *A* as computed by [?gttrf](#).

The array *d* contains the *n* diagonal elements of the upper triangular matrix *U* from the *LU* factorization of *A*.

The array *du* contains the (*n* - 1) elements of the first superdiagonal of *U*.

The array *du2* contains the (*n* - 2) elements of the second superdiagonal of *U*.

ipiv

INTEGER.

Array, size (*n*). The array of pivot indices, as returned by [?gttrf](#).

anorm

REAL for single precision flavors.

DOUBLE PRECISION for double precision flavors.

The norm of the *original* matrix *A*(see *Description*).

work

REAL for sgtcon

DOUBLE PRECISION for dgtcon

COMPLEX for cgtcon

DOUBLE COMPLEX for zgtcon.

Workspace array, size (2**n*).

iwork

INTEGER. Workspace array, size (*n*). Used for real flavors only.

Output Parameters

rcond

REAL for single precision flavors.

DOUBLE PRECISION for double precision flavors.

An estimate of the reciprocal of the condition number. The routine sets *rcond*=0 if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime *rcond* is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.

info INTEGER. If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `gtcon` interface are as follows:

<i>d1</i>	Holds the vector of length (<i>n</i> -1).
<i>d</i>	Holds the vector of length <i>n</i> .
<i>du</i>	Holds the vector of length (<i>n</i> -1).
<i>du2</i>	Holds the vector of length (<i>n</i> -2).
<i>ipiv</i>	Holds the vector of length <i>n</i> .
<i>norm</i>	Must be '1', 'O', or 'I'. The default value is '1'.

Application Notes

The computed *rcond* is never less than *r* (the reciprocal of the true condition number) and in practice is nearly always less than 10*r*. A call to this routine involves solving a number of systems of linear equations $A \cdot x = b$; the number is usually 4 or 5 and never more than 11. Each solution requires approximately $2n^2$ floating-point operations for real flavors and $8n^2$ for complex flavors.

?pocon

Estimates the reciprocal of the condition number of a symmetric (Hermitian) positive-definite matrix.

Syntax

```
call spocon( uplo, n, a, lda, anorm, rcond, work, iwork, info )
call dpocon( uplo, n, a, lda, anorm, rcond, work, iwork, info )
call cpocon( uplo, n, a, lda, anorm, rcond, work, rwork, info )
call zpocon( uplo, n, a, lda, anorm, rcond, work, rwork, info )
call pocon( a, anorm, rcond [,uplo] [,info] )
```

Include Files

- `mk1.fi`, `lapack.f90`

Description

The routine estimates the reciprocal of the condition number of a symmetric (Hermitian) positive-definite matrix *A*:

$$\kappa_1(A) = \|A\|_1 \|A^{-1}\|_1 \text{ (since } A \text{ is symmetric or Hermitian, } \kappa_\infty(A) = \kappa_1(A) \text{)}.$$

An estimate is obtained for $\|A^{-1}\|$, and the reciprocal of the condition number is computed as $rcond = 1 / (\|A\| \|A^{-1}\|)$.

Before calling this routine:

- compute *anorm* (either $\|A\|_1 = \max_j \sum_i |a_{ij}|$ or $\|A\|_\infty = \max_i \sum_j |a_{ij}|$)
- call [?potrf](#) to compute the Cholesky factorization of *A*.

Input Parameters

<i>n</i>	INTEGER. The order of the matrix <i>A</i> ; $n \geq 0$.
<i>a, work</i>	<p>REAL for <i>spocon</i></p> <p>DOUBLE PRECISION for <i>dpocon</i></p> <p>COMPLEX for <i>cpocon</i></p> <p>DOUBLE COMPLEX for <i>zpocon</i>.</p> <p>Arrays: <i>a(lda,*)</i>, <i>work(*)</i>.</p> <p>The array <i>a</i> contains the factored matrix <i>A</i>, as returned by ?potrf. The second dimension of <i>a</i> must be at least $\max(1, n)$.</p> <p>The array <i>work</i> is a workspace for the routine. The dimension of <i>work</i> must be at least $\max(1, 3*n)$ for real flavors and $\max(1, 2*n)$ for complex flavors.</p>
<i>lda</i>	INTEGER. The leading dimension of <i>a</i> ; $lda \geq \max(1, n)$.
<i>anorm</i>	<p>REAL for single precision flavors</p> <p>DOUBLE PRECISION for double precision flavors.</p> <p>The norm of the <i>original</i> matrix <i>A</i> (see <i>Description</i>).</p>
<i>iwork</i>	INTEGER. Workspace array, size at least $\max(1, n)$.
<i>rwork</i>	<p>REAL for <i>cpocon</i></p> <p>DOUBLE PRECISION for <i>zpocon</i>.</p> <p>Workspace array, size at least $\max(1, n)$.</p>

Output Parameters

<i>rcond</i>	<p>REAL for single precision flavors</p> <p>DOUBLE PRECISION for double precision flavors.</p> <p>An estimate of the reciprocal of the condition number. The routine sets <i>rcond</i> = 0 if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime <i>rcond</i> is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.</p>
<i>info</i>	<p>INTEGER. If <i>info</i> = 0, the execution is successful.</p> <p>If <i>info</i> = -<i>i</i>, the <i>i</i>-th parameter had an illegal value.</p>

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `pocon` interface are as follows:

<i>a</i>	Holds the matrix <i>A</i> of size (n, n) .
<i>uplo</i>	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The computed *rcond* is never less than *r* (the reciprocal of the true condition number) and in practice is nearly always less than 10*r*. A call to this routine involves solving a number of systems of linear equations $A^*x = b$; the number is usually 4 or 5 and never more than 11. Each solution requires approximately $2n^2$ floating-point operations for real flavors and $8n^2$ for complex flavors.

?ppcon

Estimates the reciprocal of the condition number of a packed symmetric (Hermitian) positive-definite matrix.

Syntax

```
call sppcon( uplo, n, ap, anorm, rcond, work, iwork, info )
call dppcon( uplo, n, ap, anorm, rcond, work, iwork, info )
call cppcon( uplo, n, ap, anorm, rcond, work, rwork, info )
call zppcon( uplo, n, ap, anorm, rcond, work, rwork, info )
call ppcon( ap, anorm, rcond [,uplo] [,info] )
```

Include Files

- `mk1.fi`, `lapack.f90`

Description

The routine estimates the reciprocal of the condition number of a packed symmetric (Hermitian) positive-definite matrix *A*:

$$\kappa_1(A) = \|A\|_1 \|A^{-1}\|_1 \text{ (since } A \text{ is symmetric or Hermitian, } \kappa_\infty(A) = \kappa_1(A) \text{)}.$$

An estimate is obtained for $\|A^{-1}\|$, and the reciprocal of the condition number is computed as $rcond = 1 / (\|A\| \|A^{-1}\|)$.

Before calling this routine:

- compute *anorm* (either $\|A\|_1 = \max_j \sum_i |a_{ij}|$ or $\|A\|_\infty = \max_i \sum_j |a_{ij}|$)
- call [?pptrf](#) to compute the Cholesky factorization of *A*.

Input Parameters

<i>n</i>	INTEGER. The order of the matrix <i>A</i> ; $n \geq 0$.
<i>ap</i> , <i>work</i>	REAL for <code>sppcon</code> DOUBLE PRECISION for <code>dppcon</code> COMPLEX for <code>cppcon</code> DOUBLE COMPLEX for <code>zppcon</code> .

Arrays: $ap(*)$, $work(*)$.

The array ap contains the packed factored matrix A , as returned by [?pptrf](#). The dimension of ap must be at least $\max(1, n(n+1)/2)$.

The array $work$ is a workspace for the routine. The dimension of $work$ must be at least $\max(1, 3*n)$ for real flavors and $\max(1, 2*n)$ for complex flavors.

anorm

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

The norm of the *original* matrix A (see *Description*).

iwork

INTEGER. Workspace array, size at least $\max(1, n)$.

rwork

REAL for `cppcon`

DOUBLE PRECISION for `zppcon`.

Workspace array, size at least $\max(1, n)$.

Output Parameters

rcond

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

An estimate of the reciprocal of the condition number. The routine sets $rcond = 0$ if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime $rcond$ is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.

info

INTEGER. If $info = 0$, the execution is successful.

If $info = -i$, the i -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `ppcon` interface are as follows:

ap

Holds the array A of size $(n*(n+1)/2)$.

uplo

Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The computed $rcond$ is never less than r (the reciprocal of the true condition number) and in practice is nearly always less than $10r$. A call to this routine involves solving a number of systems of linear equations $A*x = b$; the number is usually 4 or 5 and never more than 11. Each solution requires approximately $2n^2$ floating-point operations for real flavors and $8n^2$ for complex flavors.

Description

The routine estimates the reciprocal of the condition number of a symmetric (Hermitian) positive-definite band matrix A :

$$\kappa_1(A) = \|A\|_1 \|A^{-1}\|_1 \text{ (since } A \text{ is symmetric or Hermitian, } \kappa_\infty(A) = \kappa_1(A) \text{)}.$$

An estimate is obtained for $\|A^{-1}\|_1$, and the reciprocal of the condition number is computed as $rcond = 1 / (\|A\|_1 \|A^{-1}\|_1)$.

Before calling this routine:

- compute *anorm* (either $\|A\|_1 = \max_j \sum_i |a_{ij}|$ or $\|A\|_\infty = \max_i \sum_j |a_{ij}|$)
- call [?pbtrf](#) to compute the Cholesky factorization of A .

Input Parameters

<i>n</i>	INTEGER. The order of the matrix A ; $n \geq 0$.
<i>kd</i>	INTEGER. The number of superdiagonals or subdiagonals in the matrix A ; $kd \geq 0$.
<i>ldab</i>	INTEGER. The leading dimension of the array <i>ab</i> . ($ldab \geq kd + 1$).
<i>ab, work</i>	REAL for spbcon DOUBLE PRECISION for dpbcon COMPLEX for cpbcon DOUBLE COMPLEX for zpbcon. Arrays: <i>ab</i> (<i>ldab</i> ,*), <i>work</i> (*). The array <i>ab</i> contains the factored matrix A in band form, as returned by ?pbtrf . The second dimension of <i>ab</i> must be at least $\max(1, n)$. The array <i>work</i> is a workspace for the routine. The dimension of <i>work</i> must be at least $\max(1, 3*n)$ for real flavors and $\max(1, 2*n)$ for complex flavors.
<i>anorm</i>	REAL for single precision flavors. DOUBLE PRECISION for double precision flavors.

The norm of the *original* matrix A (see *Description*).

iwork INTEGER. Workspace array, size at least $\max(1, n)$.

rwork REAL for `cpbcon`
DOUBLE PRECISION for `zpbcon`.
Workspace array, size at least $\max(1, n)$.

Output Parameters

rcond REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
An estimate of the reciprocal of the condition number. The routine sets *rcond* = 0 if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime *rcond* is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.

info INTEGER. If *info*=0, the execution is successful.
If *info* = $-i$, the i -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `pbcon` interface are as follows:

ab Holds the array A of size $(kd+1, n)$.

uplo Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The computed *rcond* is never less than r (the reciprocal of the true condition number) and in practice is nearly always less than $10r$. A call to this routine involves solving a number of systems of linear equations $A^*x = b$; the number is usually 4 or 5 and never more than 11. Each solution requires approximately $4*n(kd + 1)$ floating-point operations for real flavors and $16*n(kd + 1)$ for complex flavors.

?ptcon

Estimates the reciprocal of the condition number of a symmetric (Hermitian) positive-definite tridiagonal matrix.

Syntax

```
call sptcon( n, d, e, anorm, rcond, work, info )
call dptcon( n, d, e, anorm, rcond, work, info )
call cptcon( n, d, e, anorm, rcond, work, info )
call zptcon( n, d, e, anorm, rcond, work, info )
```

call ptcon(d, e, anorm, rcond [,info])

Include Files

- mkl.fi, lapack.f90

Description

The routine computes the reciprocal of the condition number (in the 1-norm) of a real symmetric or complex Hermitian positive-definite tridiagonal matrix using the factorization $A = L * D * L^T$ for real flavors and $A = L * D * L^H$ for complex flavors or $A = U^T * D * U$ for real flavors and $A = U^H * D * U$ for complex flavors computed by [?pttrf](#) :

$$\kappa_1(A) = \|A\|_1 \|A^{-1}\|_1 \text{ (since } A \text{ is symmetric or Hermitian, } \kappa_\infty(A) = \kappa_1(A) \text{)}.$$

The norm $\|A^{-1}\|_1$ is computed by a direct method, and the reciprocal of the condition number is computed as $rcond = 1 / (\|A\|_1 \|A^{-1}\|_1)$.

Before calling this routine:

- compute *anorm* as $\|A\|_1 = \max_j \sum_i |a_{ij}|$
- call [?pttrf](#) to compute the factorization of *A*.

Input Parameters

<i>n</i>	INTEGER. The order of the matrix <i>A</i> ; $n \geq 0$.
<i>d, work</i>	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Arrays, dimension (<i>n</i>). The array <i>d</i> contains the <i>n</i> diagonal elements of the diagonal matrix <i>D</i> from the factorization of <i>A</i> , as computed by ?pttrf ; <i>work</i> is a workspace array.
<i>e</i>	REAL for sptcon DOUBLE PRECISION for dptcon COMPLEX for cptcon DOUBLE COMPLEX for zptcon. Array, size (<i>n</i> -1). Contains off-diagonal elements of the unit bidiagonal factor <i>U</i> or <i>L</i> from the factorization computed by ?pttrf .
<i>anorm</i>	REAL for single precision flavors. DOUBLE PRECISION for double precision flavors. The 1- norm of the <i>original</i> matrix <i>A</i> (see <i>Description</i>).

Output Parameters

<i>rcond</i>	REAL for single precision flavors DOUBLE PRECISION for double precision flavors.
--------------	---

An estimate of the reciprocal of the condition number. The routine sets $rcond = 0$ if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime $rcond$ is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.

info

INTEGER.

If $info = 0$, the execution is successful.

If $info = -i$, the i -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `gtcon` interface are as follows:

d Holds the vector of length n .

e Holds the vector of length $(n-1)$.

Application Notes

The computed $rcond$ is never less than r (the reciprocal of the true condition number) and in practice is nearly always less than $10r$. A call to this routine involves solving a number of systems of linear equations $A*x = b$; the number is usually 4 or 5 and never more than 11. Each solution requires approximately $4*n(kd + 1)$ floating-point operations for real flavors and $16*n(kd + 1)$ for complex flavors.

?sycon

Estimates the reciprocal of the condition number of a symmetric matrix.

Syntax

```
call ssycon( uplo, n, a, lda, ipiv, anorm, rcond, work, iwork, info )
call dsycon( uplo, n, a, lda, ipiv, anorm, rcond, work, iwork, info )

```

Include Files

- `mkl.fi`, `lapack.f90`

Description

The routine estimates the reciprocal of the condition number of a packed symmetric matrix *A*:

$$\kappa_1(A) = \|A\|_1 \|A^{-1}\|_1 \text{ (since } A \text{ is symmetric, } \kappa_\infty(A) = \kappa_1(A) \text{)}.$$

An estimate is obtained for $\|A^{-1}\|_1$, and the reciprocal of the condition number is computed as $rcond = 1 / (\|A\|_1 \|A^{-1}\|_1)$.

Before calling this routine:

- compute *anorm* (either $\|A\|_1 = \max_j \sum_i |a_{ij}|$ or $\|A\|_\infty = \max_i \sum_j |a_{ij}|$)

- call `?sptf` to compute the factorization of A .

Input Parameters

<code>uplo</code>	<p>CHARACTER*1. Must be 'U' or 'L'.</p> <p>Indicates how the input matrix A has been factored:</p> <p>If <code>uplo</code> = 'U', the array <code>ap</code> stores the packed upper triangular factor U of the factorization $A = U*D*U^T$.</p> <p>If <code>uplo</code> = 'L', the array <code>ap</code> stores the packed lower triangular factor L of the factorization $A = L*D*L^T$.</p>
<code>n</code>	<p>INTEGER. The order of matrix A; $n \geq 0$.</p>
<code>ap, work</code>	<p>REAL for <code>sspcn</code></p> <p>DOUBLE PRECISION for <code>dspcn</code></p> <p>COMPLEX for <code>cspcn</code></p> <p>DOUBLE COMPLEX for <code>zspcn</code>.</p> <p>Arrays: <code>ap(*)</code>, <code>work(*)</code>.</p> <p>The array <code>ap</code> contains the packed factored matrix A, as returned by <code>?sptf</code>. The dimension of <code>ap</code> must be at least $\max(1, n(n+1)/2)$.</p> <p>The array <code>work</code> is a workspace for the routine. The dimension of <code>work</code> must be at least $\max(1, 2*n)$.</p>
<code>ipiv</code>	<p>INTEGER. Array, size at least $\max(1, n)$.</p> <p>The array <code>ipiv</code>, as returned by <code>?sptf</code>.</p>
<code>anorm</code>	<p>REAL for single precision flavors.</p> <p>DOUBLE PRECISION for double precision flavors.</p> <p>The norm of the <i>original</i> matrix A (see <i>Description</i>).</p>
<code>iwork</code>	<p>INTEGER. Workspace array, size at least $\max(1, n)$.</p>

Output Parameters

<code>rcond</code>	<p>REAL for single precision flavors.</p> <p>DOUBLE PRECISION for double precision flavors.</p> <p>An estimate of the reciprocal of the condition number. The routine sets <code>rcond</code> = 0 if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime <code>rcond</code> is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.</p>
<code>info</code>	<p>INTEGER. If <code>info</code> = 0, the execution is successful.</p> <p>If <code>info</code> = $-i$, the i-th parameter had an illegal value.</p>

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `spcon` interface are as follows:

<code>ap</code>	Holds the array A of size $(n*(n+1)/2)$.
<code>ipiv</code>	Holds the vector of length n .
<code>uplo</code>	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The computed `rcond` is never less than r (the reciprocal of the true condition number) and in practice is nearly always less than $10r$. A call to this routine involves solving a number of systems of linear equations $A*x = b$; the number is usually 4 or 5 and never more than 11. Each solution requires approximately $2n^2$ floating-point operations for real flavors and $8n^2$ for complex flavors.

[Matrix Storage Schemes](#)

?hpcon

Estimates the reciprocal of the condition number of a packed Hermitian matrix.

Syntax

```
call chpcon( uplo, n, ap, ipiv, anorm, rcond, work, info )
call zhpcon( uplo, n, ap, ipiv, anorm, rcond, work, info )
call hpcon( ap, ipiv, anorm, rcond [,uplo] [,info] )
```

Include Files

- `mkl.fi`, `lapack.f90`

Description

The routine estimates the reciprocal of the condition number of a Hermitian matrix A :

$$\kappa_1(A) = \|A\|_1 \|A^{-1}\|_1 \text{ (since } A \text{ is Hermitian, } \kappa_\infty(A) = \kappa_1(A) \text{)}.$$

An estimate is obtained for $\|A^{-1}\|$, and the reciprocal of the condition number is computed as $rcond = 1 / (\|A\| \|A^{-1}\|)$.

Before calling this routine:

- compute `anorm` (either $\|A\|_1 = \max_j \sum_i |a_{ij}|$ or $\|A\|_\infty = \max_i \sum_j |a_{ij}|$)
- call [?hptrf](#) to compute the factorization of A .

Input Parameters

<code>uplo</code>	CHARACTER*1. Must be 'U' or 'L'.
	Indicates how the input matrix A has been factored:
	If <code>uplo</code> = 'U', the array <code>ap</code> stores the packed upper triangular factor U of the factorization $A = U^*D^*U^T$.

If `uplo = 'L'`, the array `ap` stores the packed lower triangular factor L of the factorization $A = L^*D^*L^T$.

`n` INTEGER. The order of matrix A ; $n \geq 0$.

`ap, work` COMPLEX for `chpcon`
DOUBLE COMPLEX for `zhpcon`.

The array `ap(*)` contains the packed factored matrix A , as returned by `?hptrf`. The dimension of `ap` must be at least $\max(1, n(n+1)/2)$.

The array `work(*)` is a workspace for the routine. The dimension of `work` must be at least $\max(1, 2*n)$.

`ipiv` INTEGER.

Array, size at least $\max(1, n)$. The array `ipiv`, as returned by `?hptrf`.

`anorm` REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
The norm of the *original* matrix A (see *Description*).

Output Parameters

`rcond` REAL for single precision flavors.
DOUBLE PRECISION for double precision flavors.
An estimate of the reciprocal of the condition number. The routine sets `rcond = 0` if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime `rcond` is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.

`info` INTEGER. If `info = 0`, the execution is successful.
If `info = -i`, the i -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `hbcon` interface are as follows:

`ap` Holds the array A of size $(n*(n+1)/2)$.

`ipiv` Holds the vector of length n .

Application Notes

The computed `rcond` is never less than r (the reciprocal of the true condition number) and in practice is nearly always less than $10r$. A call to this routine involves solving a number of systems of linear equations $A*x = b$; the number is usually 5 and never more than 11. Each solution requires approximately $8n^2$ floating-point operations.

```

Include Files

- mkl.fi, lapack.f90

Description

The routine estimates the reciprocal of the condition number of a triangular matrix A in either the 1-norm or infinity-norm:

$$\kappa_1(A) = \|A\|_1 \|A^{-1}\|_1 = \kappa_\infty(A^T) = \kappa_\infty(A^H)$$

$$\kappa_\infty(A) = \|A\|_\infty \|A^{-1}\|_\infty = \kappa_1(A^T) = \kappa_1(A^H).$$

Input Parameters

<i>norm</i>	<p>CHARACTER*1. Must be '1' or 'O' or 'I'.</p> <p>If <i>norm</i> = '1' or 'O', then the routine estimates the condition number of matrix A in 1-norm.</p> <p>If <i>norm</i> = 'I', then the routine estimates the condition number of matrix A in infinity-norm.</p>
<i>uplo</i>	<p>CHARACTER*1. Must be 'U' or 'L'.</p> <p>Indicates whether A is upper or lower triangular:</p> <p>If <i>uplo</i> = 'U', the array <i>a</i> stores the upper triangle of A, other array elements are not referenced.</p> <p>If <i>uplo</i> = 'L', the array <i>a</i> stores the lower triangle of A, other array elements are not referenced.</p>
<i>diag</i>	<p>CHARACTER*1. Must be 'N' or 'U'.</p> <p>If <i>diag</i> = 'N', then A is not a unit triangular matrix.</p> <p>If <i>diag</i> = 'U', then A is unit triangular: diagonal elements are assumed to be 1 and not referenced in the array <i>a</i>.</p>
<i>n</i>	<p>INTEGER. The order of the matrix A; $n \geq 0$.</p>
<i>a, work</i>	<p>REAL for strcon</p> <p>DOUBLE PRECISION for dtrcon</p>

COMPLEX for `ctrcon`

DOUBLE COMPLEX for `ztrcon`.

The array $a(lda,*)$ contains the matrix A . The second dimension of a must be at least $\max(1, n)$.

The array $work(*)$ is a workspace for the routine. The dimension of $work$ must be at least $\max(1, 3*n)$ for real flavors and $\max(1, 2*n)$ for complex flavors.

lda

INTEGER. The leading dimension of a ; $lda \geq \max(1, n)$.

iwork

INTEGER. Workspace array, size at least $\max(1, n)$.

rwork

REAL for `ctrcon`

DOUBLE PRECISION for `ztrcon`.

Workspace array, size at least $\max(1, n)$.

Output Parameters

rcond

REAL for single precision flavors.

DOUBLE PRECISION for double precision flavors.

An estimate of the reciprocal of the condition number. The routine sets $rcond = 0$ if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime $rcond$ is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.

info

INTEGER. If $info = 0$, the execution is successful.

If $info = -i$, the i -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `trcon` interface are as follows:

a

Holds the matrix A of size (n, n) .

norm

Must be '1', 'O', or 'I'. The default value is '1'.

uplo

Must be 'U' or 'L'. The default value is 'U'.

diag

Must be 'N' or 'U'. The default value is 'N'.

Application Notes

The computed $rcond$ is never less than r (the reciprocal of the true condition number) and in practice is nearly always less than $10r$. A call to this routine involves solving a number of systems of linear equations $A*x = b$; the number is usually 4 or 5 and never more than 11. Each solution requires approximately n^2 floating-point operations for real flavors and $4n^2$ operations for complex flavors.

<i>n</i>	<p>INTEGER. The order of the matrix A; $n \geq 0$.</p>
<i>kd</i>	<p>INTEGER. The number of superdiagonals or subdiagonals in the matrix A; $kd \geq 0$.</p>
<i>ab, work</i>	<p>REAL for stbcon</p> <p>DOUBLE PRECISION for dtbcon</p>

COMPLEX for `ctbcon`

DOUBLE COMPLEX for `ztbcon`.

The array `ab(ldab,*)` contains the band matrix A . The second dimension of `ab` must be at least $\max(1, n)$.

The array `work` is a workspace for the routine. The dimension of `work(*)` must be at least $\max(1, 3*n)$ for real flavors and $\max(1, 2*n)$ for complex flavors.

`ldab`

INTEGER. The leading dimension of the array `ab`. ($ldab \geq kd + 1$).

`iwork`

INTEGER. Workspace array, size at least $\max(1, n)$.

`rwork`

REAL for `ctbcon`

DOUBLE PRECISION for `ztbcon`.

Workspace array, size at least $\max(1, n)$.

Output Parameters

`rcond`

REAL for single precision flavors.

DOUBLE PRECISION for double precision flavors.

An estimate of the reciprocal of the condition number. The routine sets `rcond` = 0 if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime `rcond` is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.

`info`

INTEGER. If `info` = 0, the execution is successful.

Refining the Solution and Estimating Its Error

This section describes the LAPACK routines for refining the computed solution of a system of linear equations and estimating the solution error. You can call these routines after factorizing the matrix of the system of equations and computing the solution (see [Routines for Matrix Factorization](#) and [Routines for Solving Systems of Linear Equations](#)).

?gerfs

Refines the solution of a system of linear equations with a general coefficient matrix and estimates its error.

Syntax

```
call sgerfs( trans, n, nrhs, a, lda, af, ldaf, ipiv, b, ldb, x, ldx, ferr, berr, work,
            iwork, info )

call dgerfs( trans, n, nrhs, a, lda, af, ldaf, ipiv, b, ldb, x, ldx, ferr, berr, work,
            iwork, info )

call cgerfs( trans, n, nrhs, a, lda, af, ldaf, ipiv, b, ldb, x, ldx, ferr, berr, work,
            rwork, info )

call zgerfs( trans, n, nrhs, a, lda, af, ldaf, ipiv, b, ldb, x, ldx, ferr, berr, work,
            rwork, info )

call gerfs( a, af, ipiv, b, x [,trans] [,ferr] [,berr] [,info] )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine performs an iterative refinement of the solution to a system of linear equations $A*X = B$ or $A^T*X = B$ or $A^H*X = B$ with a general matrix A , with multiple right-hand sides. For each computed solution vector x , the routine computes the *component-wise backward error*. This error is the smallest relative perturbation in elements of A and b such that x is the exact solution of the perturbed system:

$$|\delta a_{ij}| \leq \beta |a_{ij}|, \quad |\delta b_i| \leq \beta |b_i| \text{ such that } (A + \delta A)x = (b + \delta b).$$

Finally, the routine estimates the *component-wise forward error* in the computed solution $\|x - x_e\|_\infty / \|x\|_\infty$ (here x_e is the exact solution).

Before calling this routine:

- call the factorization routine [?getrf](#)
- call the solver routine [?getrs](#).

Input Parameters

trans CHARACTER*1. Must be 'N' or 'T' or 'C'.
Indicates the form of the equations:
If *trans* = 'N', the system has the form $A*X = B$.
If *trans* = 'T', the system has the form $A^T*X = B$.

If $trans = 'C'$, the system has the form $A^H X = B$.

<i>n</i>	INTEGER. The order of the matrix <i>A</i> ; $n \geq 0$.
<i>nrhs</i>	INTEGER. The number of right-hand sides; $nrhs \geq 0$.
<i>a, af, b, x, work</i>	<p>REAL for sgerfs DOUBLE PRECISION for dgerfs COMPLEX for cgerfs DOUBLE COMPLEX for zgerfs.</p> <p>Arrays:</p> <p><i>a</i>(size <i>lda</i> by *) contains the original matrix <i>A</i>, as supplied to ?getrf. <i>af</i>(size <i>ldaf</i> by *) contains the factored matrix <i>A</i>, as returned by ?getrf. <i>b</i>(size <i>ldb</i> by *) contains the right-hand side matrix <i>B</i>. <i>x</i>(size <i>ldx</i> by *) contains the solution matrix <i>X</i>. <i>work</i>(size *) is a workspace array.</p> <p>The second dimension of <i>a</i> and <i>af</i> must be at least $\max(1, n)$; the second dimension of <i>b</i> and <i>x</i> must be at least $\max(1, nrhs)$; the dimension of <i>work</i> must be at least $\max(1, 3*n)$ for real flavors and $\max(1, 2*n)$ for complex flavors.</p>
<i>lda</i>	INTEGER. The leading dimension of <i>a</i> ; $lda \geq \max(1, n)$.
<i>ldaf</i>	INTEGER. The leading dimension of <i>af</i> ; $ldaf \geq \max(1, n)$.
<i>ldb</i>	INTEGER. The leading dimension of <i>b</i> ; $ldb \geq \max(1, n)$.
<i>ldx</i>	INTEGER. The leading dimension of <i>x</i> ; $ldx \geq \max(1, n)$.
<i>ipiv</i>	<p>INTEGER.</p> <p>Array, size at least $\max(1, n)$.</p> <p>The <i>ipiv</i> array, as returned by ?getrf.</p>
<i>iwork</i>	<p>INTEGER.</p> <p>Workspace array, size at least $\max(1, n)$.</p>
<i>rwork</i>	<p>REAL for cgerfs DOUBLE PRECISION for zgerfs.</p> <p>Workspace array, size at least $\max(1, n)$.</p>
Output Parameters	
<i>x</i>	The refined solution matrix <i>X</i> .
<i>ferr, berr</i>	<p>REAL for single precision flavors DOUBLE PRECISION for double precision flavors.</p>

Arrays, size at least $\max(1, nrhs)$. Contain the component-wise forward and backward errors, respectively, for each solution vector.

info

INTEGER. If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine *gerfs* interface are as follows:

<i>a</i>	Holds the matrix <i>A</i> of size (<i>n</i> , <i>n</i>).
<i>af</i>	Holds the matrix <i>AF</i> of size (<i>n</i> , <i>n</i>).
<i>ipiv</i>	Holds the vector of length <i>n</i> .
<i>b</i>	Holds the matrix <i>B</i> of size (<i>n</i> , <i>nrhs</i>).
<i>x</i>	Holds the matrix <i>X</i> of size (<i>n</i> , <i>nrhs</i>).
<i>ferr</i>	Holds the vector of length (<i>nrhs</i>).
<i>berr</i>	Holds the vector of length (<i>nrhs</i>).
<i>trans</i>	Must be 'N', 'C', or 'T'. The default value is 'N'.

Application Notes

The bounds returned in *ferr* are not rigorous, but in practice they almost always overestimate the actual error.

For each right-hand side, computation of the backward error involves a minimum of $4n^2$ floating-point operations (for real flavors) or $16n^2$ operations (for complex flavors). In addition, each step of iterative refinement involves $6n^2$ operations (for real flavors) or $24n^2$ operations (for complex flavors); the number of iterations may range from 1 to 5. Estimating the forward error involves solving a number of systems of linear equations $A*x = b$ with the same coefficient matrix *A* and different right hand sides *b*; the number is usually 4 or 5 and never more than 11. Each solution requires approximately $2n^2$ floating-point operations for real flavors or $8n^2$ for complex flavors.

info )

call zgerfsx( trans, equed, n, nrhs, a, lda, af, ldaf, ipiv, r, c, b, ldb, x, ldx,
rcond, berr, n_err_bnds, err_bnds_norm, err_bnds_comp, nparams, params, work, rwork,
info )
```

Include Files

- `mkl.fi`, `lapack.f90`

Description

The routine improves the computed solution to a system of linear equations and provides error bounds and backward error estimates for the solution. In addition to a normwise error bound, the code provides a maximum componentwise error bound, if possible. See comments for `err_bnds_norm` and `err_bnds_comp` for details of the error bounds.

The original system of linear equations may have been equilibrated before calling this routine, as described by the parameters `equed`, `r`, and `c` below. In this case, the solution and error bounds returned are for the original unequilibrated system.

Input Parameters

<code>trans</code>	<p>CHARACTER*1. Must be 'N', 'T', or 'C'.</p> <p>Specifies the form of the system of equations:</p> <p>If <code>trans</code> = 'N', the system has the form $A * X = B$ (No transpose).</p> <p>If <code>trans</code> = 'T', the system has the form $A^T * X = B$ (Transpose).</p> <p>If <code>trans</code> = 'C', the system has the form $A^H * X = B$ (Conjugate transpose for complex flavors, Transpose for real flavors).</p>
<code>equed</code>	<p>CHARACTER*1. Must be 'N', 'R', 'C', or 'B'.</p> <p>Specifies the form of equilibration that was done to A before calling this routine.</p> <p>If <code>equed</code> = 'N', no equilibration was done.</p> <p>If <code>equed</code> = 'R', row equilibration was done, that is, A has been premultiplied by <code>diag(r)</code>.</p> <p>If <code>equed</code> = 'C', column equilibration was done, that is, A has been postmultiplied by <code>diag(c)</code>.</p> <p>If <code>equed</code> = 'B', both row and column equilibration was done, that is, A has been replaced by <code>diag(r) * A * diag(c)</code>. The right-hand side B has been changed accordingly.</p>
<code>n</code>	<p>INTEGER. The number of linear equations; the order of the matrix A; $n \geq 0$.</p>
<code>nrhs</code>	<p>INTEGER. The number of right-hand sides; the number of columns of the matrices B and X; $nrhs \geq 0$.</p>

<i>a, af, b, work</i>	<p>REAL for sgerfsx</p> <p>DOUBLE PRECISION for dgerfsx</p> <p>COMPLEX for cgerfsx</p> <p>DOUBLE COMPLEX for zgerfsx.</p> <p>Arrays: <i>a</i> (size <i>lda</i> by *), <i>af</i> (size <i>ldaf</i> by *), <i>b</i>(size <i>ldb</i> by *), <i>work</i>(*).</p> <p>The array <i>a</i> contains the original <i>n</i>-by-<i>n</i> matrix <i>A</i>.</p> <p>The array <i>af</i> contains the factored form of the matrix <i>A</i>, that is, the factors <i>L</i> and <i>U</i> from the factorization $A = P * L * U$ as computed by ?getrf.</p> <p>The array <i>b</i> contains the matrix <i>B</i> whose columns are the right-hand sides for the systems of equations. The second dimension of <i>b</i> must be at least $\max(1, nrhs)$.</p> <p><i>work</i> (size *) is a workspace array. The dimension of <i>work</i> must be at least $\max(1, 4 * n)$ for real flavors, and at least $\max(1, 2 * n)$ for complex flavors.</p>
<i>lda</i>	INTEGER. The leading dimension of <i>a</i> ; $lda \geq \max(1, n)$.
<i>ldaf</i>	INTEGER. The leading dimension of <i>af</i> ; $ldaf \geq \max(1, n)$.
<i>ipiv</i>	<p>INTEGER.</p> <p>Array, size at least $\max(1, n)$. Contains the pivot indices as computed by ?getrf; for row $1 \leq i \leq n$, row <i>i</i> of the matrix was interchanged with row <i>ipiv</i>(<i>i</i>).</p>
<i>r, c</i>	<p>REAL for single precision flavors</p> <p>DOUBLE PRECISION for double precision flavors.</p> <p>Arrays: <i>r</i> (size <i>n</i>), <i>c</i> (size <i>n</i>). The array <i>r</i> contains the row scale factors for <i>A</i>, and the array <i>c</i> contains the column scale factors for <i>A</i>.</p> <p><i>equed</i> = 'R' or 'B', <i>A</i> is multiplied on the left by <i>diag</i>(<i>r</i>); if <i>equed</i> = 'N' or 'C', <i>r</i> is not accessed.</p> <p>If <i>equed</i> = 'R' or 'B', each element of <i>r</i> must be positive.</p> <p>If <i>equed</i> = 'C' or 'B', <i>A</i> is multiplied on the right by <i>diag</i>(<i>c</i>); if <i>equed</i> = 'N' or 'R', <i>c</i> is not accessed.</p> <p>If <i>equed</i> = 'C' or 'B', each element of <i>c</i> must be positive.</p> <p>Each element of <i>r</i> or <i>c</i> should be a power of the radix to ensure a reliable solution and error estimates. Scaling by powers of the radix does not cause rounding errors unless the result underflows or overflows. Rounding errors during scaling lead to refining with a matrix that is not equivalent to the input matrix, producing error estimates that may not be reliable.</p>
<i>ldb</i>	INTEGER. The leading dimension of the array <i>b</i> ; $ldb \geq \max(1, n)$.
<i>x</i>	<p>REAL for sgerfsx</p> <p>DOUBLE PRECISION for dgerfsx</p> <p>COMPLEX for cgerfsx</p> <p>DOUBLE COMPLEX for zgerfsx.</p>

Array, size ldx by $*$.

The solution matrix X as computed by `?getrs`

<code>ldx</code>	INTEGER. The leading dimension of the output array x ; $ldx \geq \max(1, n)$.
<code>n_err_bnds</code>	INTEGER. Number of error bounds to return for each right hand side and each type (normwise or componentwise). See <code>err_bnds_norm</code> and <code>err_bnds_comp</code> descriptions in <i>Output Arguments</i> section below.
<code>nparams</code>	INTEGER. Specifies the number of parameters set in <code>params</code> . If ≤ 0 , the <code>params</code> array is never referenced and default values are used.
<code>params</code>	<p>REAL for single precision flavors</p> <p>DOUBLE PRECISION for double precision flavors.</p> <p>Array, size <code>nparams</code>. Specifies algorithm parameters. If an entry is less than 0.0, that entry is filled with the default value used for that parameter. Only positions up to <code>nparams</code> are accessed; defaults are used for higher-numbered parameters. If defaults are acceptable, you can pass <code>nparams = 0</code>, which prevents the source code from accessing the <code>params</code> argument.</p> <p><code>params(1)</code> : Whether to perform iterative refinement or not. Default: 1.0</p> <p>=0.0 No refinement is performed and no error bounds are computed.</p> <p>=1.0 Use the double-precision refinement algorithm, possibly with doubled-single computations if the compilation environment does not support double precision.</p> <p>(Other values are reserved for future use.)</p> <p><code>params(2)</code> : Maximum number of residual computations allowed for refinement.</p> <p>Default 10.0</p> <p>Aggressive Set to 100.0 to permit convergence using approximate factorizations or factorizations other than <i>LU</i>. If the factorization uses a technique other than Gaussian elimination, the guarantees in <code>err_bnds_norm</code> and <code>err_bnds_comp</code> may no longer be trustworthy.</p> <p><code>params(3)</code> : Flag determining if the code will attempt to find a solution with a small componentwise relative error in the double-precision algorithm. Positive is true, 0.0 is false. Default: 1.0 (attempt componentwise convergence).</p>
<code>iwork</code>	INTEGER. Workspace array, size at least $\max(1, n)$; used in real flavors only.
<code>rwork</code>	<p>REAL for single precision flavors</p> <p>DOUBLE PRECISION for double precision flavors.</p>

Workspace array, size at least $\max(1, 3*n)$; used in complex flavors only.

Output Parameters

<i>x</i>	<p>REAL for sgerfsx</p> <p>DOUBLE PRECISION for dgerfsx</p> <p>COMPLEX for cgerfsx</p> <p>DOUBLE COMPLEX for zgerfsx.</p> <p>The improved solution matrix <i>X</i>.</p>
<i>rcond</i>	<p>REAL for single precision flavors</p> <p>DOUBLE PRECISION for double precision flavors.</p> <p>Reciprocal scaled condition number. An estimate of the reciprocal Skeel condition number of the matrix <i>A</i> after equilibration (if done). If <i>rcond</i> is less than the machine precision, in particular, if <i>rcond</i> = 0, the matrix is singular to working precision. Note that the error may still be small even if this number is very small and the matrix appears ill-conditioned.</p>
<i>berr</i>	<p>REAL for single precision flavors</p> <p>DOUBLE PRECISION for double precision flavors.</p> <p>Array, size at least $\max(1, nrhs)$. Contains the componentwise relative backward error for each solution vector <i>x(j)</i>, that is, the smallest relative change in any element of <i>A</i> or <i>B</i> that makes <i>x(j)</i> an exact solution.</p>
<i>err_bnds_norm</i>	<p>REAL for single precision flavors</p> <p>DOUBLE PRECISION for double precision flavors.</p> <p>Array of size <i>nrhs</i> by <i>n_err_bnds</i>. For each right-hand side, contains information about various error bounds and condition numbers corresponding to the normwise relative error, which is defined as follows:</p> <p>Normwise relative error in the <i>i</i>-th solution vector</p> $\frac{\max_j X_{true_{ji}} - X_{ji} }{\max_j X_{ji} }$ <p>The array is indexed by the type of error information as described below. There are currently up to three pieces of information returned.</p> <p>The first index in <i>err_bnds_norm(i,:)</i> corresponds to the <i>i</i>-th right-hand side.</p> <p>The second index in <i>err_bnds_norm(:,err)</i> contains the following three fields:</p> <div style="display: flex; justify-content: space-between; margin-top: 10px;"> <div style="width: 30%;"> <p><i>err</i>=1</p> </div> <div style="width: 65%;"> <p>"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold $\sqrt{n} * \text{slamch}(\epsilon)$ for single precision flavors and $\sqrt{n} * \text{dlamch}(\epsilon)$ for double precision flavors.</p> </div> </div>

`err=2`

"Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold $\sqrt{n} * \text{slamch}(\epsilon)$ for single precision flavors and $\sqrt{n} * \text{dlamch}(\epsilon)$ for double precision flavors. This error bound should only be trusted if the previous boolean is true.

`err=3`

Reciprocal condition number. Estimated normwise reciprocal condition number. Compared with the threshold $\sqrt{n} * \text{slamch}(\epsilon)$ for single precision flavors and $\sqrt{n} * \text{dlamch}(\epsilon)$ for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix Z are:

$$\|Z\|_{\infty} \cdot \|Z^{-1}\|_{\infty}$$

Let $z = s * a$, where s scales each row by a power of the radix so all absolute row sums of z are approximately 1.

`err_bnds_comp`

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array of size `nrhs` by `n_err_bnds`. For each right-hand side, contains information about various error bounds and condition numbers corresponding to the componentwise relative error, which is defined as follows:

Componentwise relative error in the i -th solution vector:

$$\max_j \frac{|X_{true_{ji}} - X_{ji}|}{|X_{ji}|}$$

The array is indexed by the right-hand side i , on which the componentwise relative error depends, and by the type of error information as described below. There are currently up to three pieces of information returned for each right-hand side. If componentwise accuracy is not requested (`params(3) = 0.0`), then `err_bnds_comp` is not accessed. If `n_err_bnds < 3`, then at most the first `(:, n_err_bnds)` entries are returned.

The first index in `err_bnds_comp(i, :)` corresponds to the i -th right-hand side.

The second index in `err_bnds_comp(:, err)` contains the following three fields:

<code>err=1</code>	"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold $\sqrt{n} * \text{slamch}(\epsilon)$ for single precision flavors and $\sqrt{n} * \text{dlamch}(\epsilon)$ for double precision flavors.
<code>err=2</code>	"Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold $\sqrt{n} * \text{slamch}(\epsilon)$ for single precision flavors and $\sqrt{n} * \text{dlamch}(\epsilon)$ for double precision flavors. This error bound should only be trusted if the previous boolean is true.
<code>err=3</code>	Reciprocal condition number. Estimated componentwise reciprocal condition number. Compared with the threshold $\sqrt{n} * \text{slamch}(\epsilon)$ for single precision flavors and $\sqrt{n} * \text{dlamch}(\epsilon)$ for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix Z are: $\ Z\ _{\infty} \cdot \ Z^{-1}\ _{\infty}$ <p>Let $z = s * (a * \text{diag}(x))$, where x is the solution for the current right-hand side and s scales each row of $a * \text{diag}(x)$ by a power of the radix so all absolute row sums of z are approximately 1.</p>

`params`

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Output parameter only if the input contains erroneous values, namely, in `params(1)`, `params(2)`, `params(3)`. In such a case, the corresponding elements of `params` are filled with default values on output.

`info`

INTEGER. If `info` = 0, the execution is successful. The solution to every right-hand side is guaranteed.

If `info` = $-i$, the i -th parameter had an illegal value.

If $0 < \text{info} \leq n$: $U_{\text{info}, \text{info}}$ is exactly zero. The factorization has been completed, but the factor U is exactly singular, so the solution and error bounds could not be computed; `rcond` = 0 is returned.

If `info` = $n+j$: The solution corresponding to the j -th right-hand side is not guaranteed. The solutions corresponding to other right-hand sides k with $k > j$ may not be guaranteed as well, but only the first such right-hand side is reported. If a small componentwise error is not requested `params(3)` = 0.0, then the j -th right-hand side is the first with a normwise error bound that is not guaranteed (the smallest j such that `err_bnds_norm(j,1)` =

0.0 or `err_bnds_comp(j,1) = 0.0`). See the definition of `err_bnds_norm` and `err_bnds_comp` for `err = 1`. To get information about all of the right-hand sides, check `err_bnds_norm` or `err_bnds_comp`.

Description

The routine performs an iterative refinement of the solution to a system of linear equations $A^*X = B$ or $A^T X = B$ or $A^H X = B$ with a band matrix A , with multiple right-hand sides. For each computed solution vector x , the routine computes the *component-wise backward error* β . This error is the smallest relative perturbation in elements of A and b such that x is the exact solution of the perturbed system:

$$|\delta a_{ij}| \leq \beta |a_{ij}|, \quad |\delta b_i| \leq \beta |b_i| \quad \text{such that} \quad (A + \delta A)x = (b + \delta b).$$

Finally, the routine estimates the *component-wise forward error* in the computed solution $\|x - x_e\|_\infty / \|x\|_\infty$ (here x_e is the exact solution).

Before calling this routine:

- call the factorization routine [?gbtrf](#)
- call the solver routine [?gbtrs](#).

Input Parameters

`trans`

CHARACTER*1. Must be 'N' or 'T' or 'C'.

Indicates the form of the equations:

If `trans = 'N'`, the system has the form $A^*X = B$.

If `trans = 'T'`, the system has the form $A^T X = B$.

If `trans = 'C'`, the system has the form $A^H X = B$.

<i>n</i>	INTEGER. The order of the matrix <i>A</i> ; $n \geq 0$.
<i>kl</i>	INTEGER. The number of sub-diagonals within the band of <i>A</i> ; $kl \geq 0$.
<i>ku</i>	INTEGER. The number of super-diagonals within the band of <i>A</i> ; $ku \geq 0$.
<i>nrhs</i>	INTEGER. The number of right-hand sides; $nrhs \geq 0$.
<i>ab,afb,b,x,work</i>	<p>REAL for sgbrfs</p> <p>DOUBLE PRECISION for dgbrfs</p> <p>COMPLEX for cgbtrfs</p> <p>DOUBLE COMPLEX for zgbrfs.</p> <p>Arrays:</p> <p><i>ab</i>(size <i>ldab</i> by *) contains the original band matrix <i>A</i>, as supplied to ?gbtrf, but stored in rows from 1 to $kl + ku + 1$.</p> <p><i>afb</i>(size <i>ldaafb</i> by *) contains the factored band matrix <i>A</i>, as returned by ?gbtrf.</p> <p><i>b</i>(size <i>ldb</i> by *) contains the right-hand side matrix <i>B</i>.</p> <p><i>x</i>(size <i>ldx</i> by *) contains the solution matrix <i>X</i>.</p> <p><i>work</i>(*) is a workspace array.</p> <p>The second dimension of <i>ab</i> and <i>afb</i> must be at least $\max(1, n)$; the second dimension of <i>b</i> and <i>x</i> must be at least $\max(1, nrhs)$; the dimension of <i>work</i> must be at least $\max(1, 3*n)$ for real flavors and $\max(1, 2*n)$ for complex flavors.</p>
<i>ldab</i>	INTEGER. The leading dimension of <i>ab</i> .
<i>ldaafb</i>	INTEGER. The leading dimension of <i>afb</i> .
<i>ldb</i>	INTEGER. The leading dimension of <i>b</i> ; $ldb \geq \max(1, n)$.
<i>ldx</i>	INTEGER. The leading dimension of <i>x</i> ; $ldx \geq \max(1, n)$.
<i>ipiv</i>	<p>INTEGER.</p> <p>Array, size at least $\max(1, n)$. The <i>ipiv</i> array, as returned by ?gbtrf.</p>
<i>iwork</i>	INTEGER. Workspace array, size at least $\max(1, n)$.
<i>rwork</i>	<p>REAL for cgbtrfs</p> <p>DOUBLE PRECISION for zgbrfs.</p> <p>Workspace array, size at least $\max(1, n)$.</p>

Output Parameters

<i>x</i>	The refined solution matrix <i>X</i> .
<i>ferr, berr</i>	REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Arrays, size at least $\max(1, nrhs)$. Contain the component-wise forward and backward errors, respectively, for each solution vector.

info

INTEGER. If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `gbrfs` interface are as follows:

<i>ab</i>	Holds the array <i>A</i> of size $(kl+ku+1, n)$.
<i>afb</i>	Holds the array <i>AF</i> of size $(2*kl*ku+1, n)$.
<i>ipiv</i>	Holds the vector of length <i>n</i> .
<i>b</i>	Holds the matrix <i>B</i> of size $(n, nrhs)$.
<i>x</i>	Holds the matrix <i>X</i> of size $(n, nrhs)$.
<i>ferr</i>	Holds the vector of length $(nrhs)$.
<i>berr</i>	Holds the vector of length $(nrhs)$.
<i>trans</i>	Must be 'N', 'C', or 'T'. The default value is 'N'.
<i>kl</i>	If omitted, assumed $kl = ku$.
<i>ku</i>	Restored as $ku = lda-kl-1$.

Application Notes

The bounds returned in *ferr* are not rigorous, but in practice they almost always overestimate the actual error.

For each right-hand side, computation of the backward error involves a minimum of $4n(kl + ku)$ floating-point operations (for real flavors) or $16n(kl + ku)$ operations (for complex flavors). In addition, each step of iterative refinement involves $2n(4kl + 3ku)$ operations (for real flavors) or $8n(4kl + 3ku)$ operations (for complex flavors); the number of iterations may range from 1 to 5. Estimating the forward error involves solving a number of systems of linear equations $A^*x = b$; the number is usually 4 or 5 and never more than 11. Each solution requires approximately $2n^2$ floating-point operations for real flavors or $8n^2$ for complex flavors.

Description

The routine improves the computed solution to a system of linear equations and provides error bounds and backward error estimates for the solution. In addition to a normwise error bound, the code provides a maximum componentwise error bound, if possible. See comments for *err_bnds_norm* and *err_bnds_comp* for details of the error bounds.

The original system of linear equations may have been equilibrated before calling this routine, as described by the parameters *equed*, *r*, and *c* below. In this case, the solution and error bounds returned are for the original unequilibrated system.

Input Parameters

<i>trans</i>	<p>CHARACTER*1. Must be 'N', 'T', or 'C'.</p> <p>Specifies the form of the system of equations:</p> <p>If <i>trans</i> = 'N', the system has the form $A * X = B$ (No transpose).</p> <p>If <i>trans</i> = 'T', the system has the form $A^T * X = B$ (Transpose).</p> <p>If <i>trans</i> = 'C', the system has the form $A^H * X = B$ (Conjugate transpose for complex flavors, Transpose for real flavors).</p>
<i>equed</i>	<p>CHARACTER*1. Must be 'N', 'R', 'C', or 'B'.</p> <p>Specifies the form of equilibration that was done to <i>A</i> before calling this routine.</p> <p>If <i>equed</i> = 'N', no equilibration was done.</p> <p>If <i>equed</i> = 'R', row equilibration was done, that is, <i>A</i> has been premultiplied by <i>diag(r)</i>.</p> <p>If <i>equed</i> = 'C', column equilibration was done, that is, <i>A</i> has been postmultiplied by <i>diag(c)</i>.</p> <p>If <i>equed</i> = 'B', both row and column equilibration was done, that is, <i>A</i> has been replaced by $diag(r) * A * diag(c)$. The right-hand side <i>B</i> has been changed accordingly.</p>

<i>n</i>	INTEGER. The number of linear equations; the order of the matrix <i>A</i> ; $n \geq 0$.
<i>kl</i>	INTEGER. The number of subdiagonals within the band of <i>A</i> ; $kl \geq 0$.
<i>ku</i>	INTEGER. The number of superdiagonals within the band of <i>A</i> ; $ku \geq 0$.
<i>nrhs</i>	INTEGER. The number of right-hand sides; the number of columns of the matrices <i>B</i> and <i>X</i> ; $nrhs \geq 0$.
<i>ab, afb, b, work</i>	<p>REAL for <code>sghbrfsx</code></p> <p>DOUBLE PRECISION for <code>dghbrfsx</code></p> <p>COMPLEX for <code>cghbrfsx</code></p> <p>DOUBLE COMPLEX for <code>zghbrfsx</code>.</p> <p>Arrays: <i>ab</i>(<i>ldab</i>,*), <i>afb</i>(<i>ldafb</i>,*), <i>b</i>(<i>ldb</i>,*), <i>work</i>(*).</p> <p>The array <i>ab</i> contains the original matrix <i>A</i> in band storage, in rows 1 to <i>kl</i> + <i>ku</i> + 1. The <i>j</i>-th column of <i>A</i> is stored in the <i>j</i>-th column of the array <i>ab</i> as follows:</p> $ab(ku+1+i-j, j) = A(i, j) \text{ for } \max(1, j-ku) \leq i \leq \min(n, j+kl).$ <p>The array <i>afb</i> contains details of the LU factorization of the banded matrix <i>A</i> as computed by <code>?gbtrf</code>. <i>U</i> is stored as an upper triangular banded matrix with <i>kl</i> + <i>ku</i> superdiagonals in rows 1 to <i>kl</i> + <i>ku</i> + 1. The multipliers used during the factorization are stored in rows <i>kl</i> + <i>ku</i> + 2 to $2*kl + ku + 1$.</p> <p>The array <i>b</i> contains the matrix <i>B</i> whose columns are the right-hand sides for the systems of equations. The second dimension of <i>b</i> must be at least $\max(1, nrhs)$.</p> <p><i>work</i>(*) is a workspace array. The dimension of <i>work</i> must be at least $\max(1, 4*n)$ for real flavors, and at least $\max(1, 2*n)$ for complex flavors.</p>
<i>ldab</i>	INTEGER. The leading dimension of the array <i>ab</i> ; $ldab \geq kl + ku + 1$.
<i>ldafb</i>	INTEGER. The leading dimension of the array <i>afb</i> ; $ldafb \geq 2*kl + ku + 1$.
<i>ipiv</i>	<p>INTEGER.</p> <p>Array, size at least $\max(1, n)$. Contains the pivot indices as computed by <code>?gbtrf</code>; for row $1 \leq i \leq n$, row <i>i</i> of the matrix was interchanged with row <i>ipiv</i>(<i>i</i>).</p>
<i>r, c</i>	<p>REAL for single precision flavors</p> <p>DOUBLE PRECISION for double precision flavors.</p> <p>Arrays: <i>r</i>(<i>n</i>), <i>c</i>(<i>n</i>). The array <i>r</i> contains the row scale factors for <i>A</i>, and the array <i>c</i> contains the column scale factors for <i>A</i>.</p> <p>If <i>equed</i> = 'R' or 'B', <i>A</i> is multiplied on the left by <i>diag</i>(<i>r</i>); if <i>equed</i> = 'N' or 'C', <i>r</i> is not accessed.</p> <p>If <i>equed</i> = 'R' or 'B', each element of <i>r</i> must be positive.</p> <p>If <i>equed</i> = 'C' or 'B', <i>A</i> is multiplied on the right by <i>diag</i>(<i>c</i>); if <i>equed</i> = 'N' or 'R', <i>c</i> is not accessed.</p> <p>If <i>equed</i> = 'C' or 'B', each element of <i>c</i> must be positive.</p>

Each element of r or c should be a power of the radix to ensure a reliable solution and error estimates. Scaling by powers of the radix does not cause rounding errors unless the result underflows or overflows. Rounding errors during scaling lead to refining with a matrix that is not equivalent to the input matrix, producing error estimates that may not be reliable.

<i>ldb</i>	INTEGER. The leading dimension of the array <i>b</i> ; $ldb \geq \max(1, n)$.						
<i>x</i>	<p>REAL for <code>sgbrfsx</code></p> <p>DOUBLE PRECISION for <code>dgbrfsx</code></p> <p>COMPLEX for <code>cgbrfsx</code></p> <p>DOUBLE COMPLEX for <code>zgbrfsx</code>.</p> <p>Array, size $(ldx, *)$.</p> <p>The solution matrix <i>X</i> as computed by <code>sgbtrs/dgbtrs</code> for real flavors or <code>cgbtrs/zgbtrs</code> for complex flavors.</p>						
<i>ldx</i>	INTEGER. The leading dimension of the output array <i>x</i> ; $ldx \geq \max(1, n)$.						
<i>n_err_bnds</i>	INTEGER. Number of error bounds to return for each right-hand side and each type (normwise or componentwise). See <code>err_bnds_norm</code> and <code>err_bnds_comp</code> descriptions in <i>Output Arguments</i> section below.						
<i>nparams</i>	INTEGER. Specifies the number of parameters set in <i>params</i> . If ≤ 0 , the <i>params</i> array is never referenced and default values are used.						
<i>params</i>	<p>REAL for single precision flavors</p> <p>DOUBLE PRECISION for double precision flavors.</p> <p>Array, size <i>nparams</i>. Specifies algorithm parameters. If an entry is less than 0.0, that entry will be filled with the default value used for that parameter. Only positions up to <i>nparams</i> are accessed; defaults are used for higher-numbered parameters. If defaults are acceptable, you can pass <i>nparams</i> = 0, which prevents the source code from accessing the <i>params</i> argument.</p> <p><i>params</i>(1) : Whether to perform iterative refinement or not. Default: 1.0 (for single precision flavors), 1.0D+0 (for double precision flavors).</p> <table> <tr> <td>=0.0</td><td>No refinement is performed and no error bounds are computed.</td></tr> <tr> <td>=1.0</td><td>Use the double-precision refinement algorithm, possibly with doubled-single computations if the compilation environment does not support double precision.</td></tr> </table> <p>(Other values are reserved for future use.)</p> <p><i>params</i>(2) : Maximum number of residual computations allowed for refinement.</p> <table> <tr> <td>Default</td><td>10.0</td></tr> </table>	=0.0	No refinement is performed and no error bounds are computed.	=1.0	Use the double-precision refinement algorithm, possibly with doubled-single computations if the compilation environment does not support double precision.	Default	10.0
=0.0	No refinement is performed and no error bounds are computed.						
=1.0	Use the double-precision refinement algorithm, possibly with doubled-single computations if the compilation environment does not support double precision.						
Default	10.0						

Aggressive Set to 100.0 to permit convergence using approximate factorizations or factorizations other than *LU*. If the factorization uses a technique other than Gaussian elimination, the guarantees in *err_bnds_norm* and *err_bnds_comp* may no longer be trustworthy.

params(3) : Flag determining if the code will attempt to find a solution with a small componentwise relative error in the double-precision algorithm. Positive is true, 0.0 is false. Default: 1.0 (attempt componentwise convergence).

iwork INTEGER. Workspace array, size at least $\max(1, n)$; used in real flavors only.

rwork REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Workspace array, size at least $\max(1, 3*n)$; used in complex flavors only.

Output Parameters

x REAL for *sghbrfsx*
DOUBLE PRECISION for *dghbrfsx*
COMPLEX for *cghbrfsx*
DOUBLE COMPLEX for *zghbrfsx*.
The improved solution matrix *X*.

rcond REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Reciprocal scaled condition number. An estimate of the reciprocal Skeel condition number of the matrix *A* after equilibration (if done). If *rcond* is less than the machine precision, in particular, if *rcond* = 0, the matrix is singular to working precision. Note that the error may still be small even if this number is very small and the matrix appears ill-conditioned.

berr REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, size at least $\max(1, nrhs)$. Contains the componentwise relative backward error for each solution vector $x(j)$, that is, the smallest relative change in any element of *A* or *B* that makes $x(j)$ an exact solution.

err_bnds_norm REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array of size *nrhs* by *n_err_bnds*. For each right-hand side, contains information about various error bounds and condition numbers corresponding to the normwise relative error, which is defined as follows:
Normwise relative error in the *i*-th solution vector

$$\frac{\max_j |X_{true_{ji}} - X_{ji}|}{\max_j |X_{ji}|}$$

The array is indexed by the type of error information as described below. There are currently up to three pieces of information returned.

The first index in `err_bnds_norm(i,:)` corresponds to the *i*-th right-hand side.

The second index in `err_bnds_norm(:,err)` contains the following three fields:

<code>err=1</code>	"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold <code>sqrt(n)*slamch(ε)</code> for single precision flavors and <code>sqrt(n)*dlamch(ε)</code> for double precision flavors.
<code>err=2</code>	"Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold <code>sqrt(n)*slamch(ε)</code> for single precision flavors and <code>sqrt(n)*dlamch(ε)</code> for double precision flavors. This error bound should only be trusted if the previous boolean is true.
<code>err=3</code>	Reciprocal condition number. Estimated normwise reciprocal condition number. Compared with the threshold <code>sqrt(n)*slamch(ε)</code> for single precision flavors and <code>sqrt(n)*dlamch(ε)</code> for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix <i>Z</i> are $\ Z\ _{\infty} \cdot \ Z^{-1}\ _{\infty}$ <p>Let $z=s*a$, where <i>s</i> scales each row by a power of the radix so all absolute row sums of <i>z</i> are approximately 1.</p>

`err_bnds_comp`

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array of size *nrhs* by *n_err_bnds*. For each right-hand side, contains information about various error bounds and condition numbers corresponding to the componentwise relative error, which is defined as follows:

Componentwise relative error in the *i*-th solution vector:

$$\max_j \frac{|X_{true_{ji}} - X_{ji}|}{|X_{ji}|}$$

The array is indexed by the right-hand side i , on which the componentwise relative error depends, and by the type of error information as described below. There are currently up to three pieces of information returned for each right-hand side. If componentwise accuracy is not requested ($params(3) = 0.0$), then `err_bnds_comp` is not accessed. If $n_err_bnds < 3$, then at most the first $(:, n_err_bnds)$ entries are returned.

The first index in `err_bnds_comp(i, :)` corresponds to the i -th right-hand side.

The second index in `err_bnds_comp(:, err)` contains the following three fields:

- | | |
|--------------------|---|
| <code>err=1</code> | "Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold $\sqrt{n} * slamch(\epsilon)$ for single precision flavors and $\sqrt{n} * dlamch(\epsilon)$ for double precision flavors. |
| <code>err=2</code> | "Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold $\sqrt{n} * slamch(\epsilon)$ for single precision flavors and $\sqrt{n} * dlamch(\epsilon)$ for double precision flavors. This error bound should only be trusted if the previous boolean is true. |
| <code>err=3</code> | Reciprocal condition number. Estimated componentwise reciprocal condition number. Compared with the threshold $\sqrt{n} * slamch(\epsilon)$ for single precision flavors and $\sqrt{n} * dlamch(\epsilon)$ for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix Z are |
- $$\|Z\|_{\infty} \cdot \|Z^{-1}\|_{\infty}$$
- Let $z = s * (a * \text{diag}(x))$, where x is the solution for the current right-hand side and s scales each row of $a * \text{diag}(x)$ by a power of the radix so all absolute row sums of z are approximately 1.

`params`

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Output parameter only if the input contains erroneous values, namely, in `params(1)`, `params(2)`, and `params(3)`. In such a case, the corresponding elements of `params` are filled with default values on output.

info INTEGER. If *info* = 0, the execution is successful. The solution to every right-hand side is guaranteed.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If $0 < info \leq n$: $U_{info,info}$ is exactly zero. The factorization has been completed, but the factor *U* is exactly singular, so the solution and error bounds could not be computed; *rcond* = 0 is returned.

If *info* = *n*+*j*: The solution corresponding to the *j*-th right-hand side is not guaranteed. The solutions corresponding to other right-hand sides *k* with *k* > *j* may not be guaranteed as well, but only the first such right-hand side is reported. If a small componentwise error is not requested *params*(3) = 0.0, then the *j*-th right-hand side is the first with a normwise error bound that is not guaranteed (the smallest *j* such that $err_bnds_norm(j,1) = 0.0$ or $err_bnds_comp(j,1) = 0.0$. See the definition of *err_bnds_norm* and *err_bnds_comp* for *err* = 1. To get information about all of the right-hand sides, check *err_bnds_norm* or *err_bnds_comp*.

Description

The routine performs an iterative refinement of the solution to a system of linear equations $A * X = B$ or $A^T * X = B$ or $A^H * X = B$ with a tridiagonal matrix *A*, with multiple right-hand sides. For each computed solution vector *x*, the routine computes the *component-wise backward error* β . This error is the smallest relative perturbation in elements of *A* and *b* such that *x* is the exact solution of the perturbed system:

$$|\delta a_{ij}| / |a_{ij}| \leq \beta |a_{ij}|, \quad |\delta b_i| / |b_i| \leq \beta |b_i| \quad \text{such that} \quad (A + \delta A) x = (b + \delta b).$$

Finally, the routine estimates the *component-wise forward error* in the computed solution $\|x - x_e\|_\infty / \|x\|_\infty$ (here x_e is the exact solution).

Before calling this routine:

- call the factorization routine [?gttrf](#)
- call the solver routine [?gttrs](#).

Input Parameters

<i>trans</i>	<p>CHARACTER*1. Must be 'N' or 'T' or 'C'.</p> <p>Indicates the form of the equations:</p> <p>If <i>trans</i> = 'N', the system has the form $A*X = B$.</p> <p>If <i>trans</i> = 'T', the system has the form $A^T*X = B$.</p> <p>If <i>trans</i> = 'C', the system has the form $A^H*X = B$.</p>
<i>n</i>	<p>INTEGER. The order of the matrix <i>A</i>; $n \geq 0$.</p>
<i>nrhs</i>	<p>INTEGER. The number of right-hand sides, that is, the number of columns of the matrix <i>B</i>; $nrhs \geq 0$.</p>

<i>iwork</i>	<p>INTEGER. Workspace array, size (n). Used for real flavors only.</p>

rwork REAL for `cgtrfs`
DOUBLE PRECISION for `zgtrfs`.
Workspace array, size (n). Used for complex flavors only.

Output Parameters

x The refined solution matrix X .

ferr, berr REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Arrays, size at least $\max(1, nrhs)$. Contain the component-wise forward and backward errors, respectively, for each solution vector.

info INTEGER. If *info* = 0, the execution is successful.
If *info* = $-i$, the i -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `gtrfs` interface are as follows:

<i>dl</i>	Holds the vector of length ($n-1$).
<i>d</i>	Holds the vector of length n .
<i>du</i>	Holds the vector of length ($n-1$).
<i>dlf</i>	Holds the vector of length ($n-1$).
<i>df</i>	Holds the vector of length n .
<i>duf</i>	Holds the vector of length ($n-1$).
<i>du2</i>	Holds the vector of length ($n-2$).
<i>ipiv</i>	Holds the vector of length n .
<i>b</i>	Holds the matrix B of size ($n, nrhs$).
<i>x</i>	Holds the matrix X of size ($n, nrhs$).
<i>ferr</i>	Holds the vector of length ($nrhs$).
<i>berr</i>	Holds the vector of length ($nrhs$).
<i>trans</i>	Must be 'N', 'C', or 'T'. The default value is 'N'.

Description

The routine performs an iterative refinement of the solution to a system of linear equations $A^*X = B$ with a symmetric (Hermitian) positive definite matrix A , with multiple right-hand sides. For each computed solution vector x , the routine computes the *component-wise backward error* β . This error is the smallest relative perturbation in elements of A and b such that x is the exact solution of the perturbed system:

$$|\delta a_{ij}| \leq \beta |a_{ij}|, \quad |\delta b_i| \leq \beta |b_i| \text{ such that } (A + \delta A)x = (b + \delta b).$$

Finally, the routine estimates the *component-wise forward error* in the computed solution $\|x - x_e\|_\infty / \|x\|_\infty$ (here x_e is the exact solution).

Before calling this routine:

- call the factorization routine [?potrf](#)
- call the solver routine [?potrs](#).

Input Parameters

<i>uplo</i>	CHARACTER*1. Must be 'U' or 'L'. If <i>uplo</i> = 'U', the upper triangle of A is stored. If <i>uplo</i> = 'L', the lower triangle of A is stored.
<i>n</i>	INTEGER. The order of the matrix A ; $n \geq 0$.
<i>nrhs</i>	INTEGER. The number of right-hand sides; $nrhs \geq 0$.
<i>a, af, b, x, work</i>	REAL for sporfs DOUBLE PRECISION for dporfs COMPLEX for cporfs DOUBLE COMPLEX for zporfs. Arrays:

$a(lda, *)$ contains the original matrix A , as supplied to [?potrf](#).
 $af(ldaf, *)$ contains the factored matrix A , as returned by [?potrf](#).
 $b ldb, *)$ contains the right-hand side matrix B .
 $x(ldx, *)$ contains the solution matrix X .
 $work(*)$ is a workspace array.

The second dimension of a and af must be at least $\max(1, n)$; the second dimension of b and x must be at least $\max(1, nrhs)$; the dimension of $work$ must be at least $\max(1, 3*n)$ for real flavors and $\max(1, 2*n)$ for complex flavors.

<i>lda</i>	INTEGER. The leading dimension of a ; $lda \geq \max(1, n)$.
<i>ldaf</i>	INTEGER. The leading dimension of af ; $ldaf \geq \max(1, n)$.
<i>ldb</i>	INTEGER. The leading dimension of b ; $ldb \geq \max(1, n)$.
<i>ldx</i>	INTEGER. The leading dimension of x ; $ldx \geq \max(1, n)$.
<i>iwork</i>	INTEGER. Workspace array, size at least $\max(1, n)$.
<i>rwork</i>	REAL for <code>cporfs</code> DOUBLE PRECISION for <code>zporfs</code> . Workspace array, size at least $\max(1, n)$.

Output Parameters

<i>x</i>	The refined solution matrix X .
<i>ferr, berr</i>	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Arrays, size at least $\max(1, nrhs)$. Contain the component-wise forward and backward errors, respectively, for each solution vector.
<i>info</i>	INTEGER. If $info = 0$, the execution is successful. If $info = -i$, the i -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `porfs` interface are as follows:

<i>a</i>	Holds the matrix A of size (n, n) .
<i>af</i>	Holds the matrix AF of size (n, n) .
<i>b</i>	Holds the matrix B of size $(n, nrhs)$.
<i>x</i>	Holds the matrix X of size $(n, nrhs)$.

<i>ferr</i>	Holds the vector of length (<i>nrhs</i>).
<i>berr</i>	Holds the vector of length (<i>nrhs</i>).
<i>uplo</i>	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The bounds returned in *ferr* are not rigorous, but in practice they almost always overestimate the actual error.

For each right-hand side, computation of the backward error involves a minimum of $4n^2$ floating-point operations (for real flavors) or $16n^2$ operations (for complex flavors). In addition, each step of iterative refinement involves $6n^2$ operations (for real flavors) or $24n^2$ operations (for complex flavors); the number of iterations may range from 1 to 5. Estimating the forward error involves solving a number of systems of linear equations $A*x = b$; the number is usually 4 or 5 and never more than 11. Each solution requires approximately $2n^2$ floating-point operations for real flavors or $8n^2$ for complex flavors.

```

Include Files

- mkl.fi, lapack.f90

Description

The routine improves the computed solution to a system of linear equations and provides error bounds and backward error estimates for the solution. In addition to a normwise error bound, the code provides a maximum componentwise error bound, if possible. See comments for *err_bnds_norm* and *err_bnds_comp* for details of the error bounds.

The original system of linear equations may have been equilibrated before calling this routine, as described by the parameters *equed* and *s* below. In this case, the solution and error bounds returned are for the original unequilibrated system.

Input Parameters

uplo CHARACTER*1. Must be 'U' or 'L'.

	<p>Indicates whether the upper or lower triangular part of A is stored:</p> <p>If $uplo = 'U'$, the upper triangle of A is stored.</p> <p>If $uplo = 'L'$, the lower triangle of A is stored.</p>
<i>equed</i>	<p>CHARACTER*1. Must be 'N' or 'Y'.</p> <p>Specifies the form of equilibration that was done to A before calling this routine.</p> <p>If $equed = 'N'$, no equilibration was done.</p> <p>If $equed = 'Y'$, both row and column equilibration was done, that is, A has been replaced by $diag(s) * A * diag(s)$. The right-hand side B has been changed accordingly.</p>
<i>n</i>	<p>INTEGER. The number of linear equations; the order of the matrix A; $n \geq 0$.</p>
<i>nrhs</i>	<p>INTEGER. The number of right-hand sides; the number of columns of the matrices B and X; $nrhs \geq 0$.</p>
<i>a, af, b, work</i>	<p>REAL for <code>sporfxx</code></p> <p>DOUBLE PRECISION for <code>dporfxx</code></p> <p>COMPLEX for <code>cporfxx</code></p> <p>DOUBLE COMPLEX for <code>zporfxx</code>.</p> <p>Arrays: $a(lda, *)$, $af(ldaf, *)$, $b(l db, *)$, $work(*)$.</p> <p>The array a contains the symmetric/Hermitian matrix A as specified by $uplo$. If $uplo = 'U'$, the leading n-by-n upper triangular part of a contains the upper triangular part of the matrix A and the strictly lower triangular part of a is not referenced. If $uplo = 'L'$, the leading n-by-n lower triangular part of a contains the lower triangular part of the matrix A and the strictly upper triangular part of a is not referenced. The second dimension of a must be at least $\max(1, n)$.</p> <p>The array af contains the triangular factor L or U from the Cholesky factorization $A = U^*T^*U$ or $A = L^*L^*T^*$ as computed by <code>spotrf</code> for real flavors or <code>dpotrf</code> for complex flavors.</p> <p>The array b contains the matrix B whose columns are the right-hand sides for the systems of equations. The second dimension of b must be at least $\max(1, nrhs)$.</p> <p>$work(*)$ is a workspace array. The dimension of $work$ must be at least $\max(1, 4*n)$ for real flavors, and at least $\max(1, 2*n)$ for complex flavors.</p>
<i>lda</i>	<p>INTEGER. The leading dimension of a; $lda \geq \max(1, n)$.</p>
<i>ldaf</i>	<p>INTEGER. The leading dimension of af; $ldaf \geq \max(1, n)$.</p>
<i>s</i>	<p>REAL for single precision flavors</p> <p>DOUBLE PRECISION for double precision flavors.</p> <p>Array of size n. The array s contains the scale factors for A.</p> <p>If $equed = 'N'$, s is not accessed.</p>

If *equed* = 'Y', each element of *s* must be positive.

Each element of *s* should be a power of the radix to ensure a reliable solution and error estimates. Scaling by powers of the radix does not cause rounding errors unless the result underflows or overflows. Rounding errors during scaling lead to refining with a matrix that is not equivalent to the input matrix, producing error estimates that may not be reliable.

ldb INTEGER. The leading dimension of the array *b*; $ldb \geq \max(1, n)$.

x REAL for *sporfxx*
 DOUBLE PRECISION for *dporfxx*
 COMPLEX for *cporfxx*
 DOUBLE COMPLEX for *zporfxx*.

Array, size *ldx* by *.

The solution matrix *X* as computed by [?potrs](#)

ldx INTEGER. The leading dimension of the output array *x*; $ldx \geq \max(1, n)$.

n_err_bnds INTEGER. Number of error bounds to return for each right hand side and each type (normwise or componentwise). See *err_bnds_norm* and *err_bnds_comp* descriptions in *Output Arguments* section below.

nparams INTEGER. Specifies the number of parameters set in *params*. If ≤ 0 , the *params* array is never referenced and default values are used.

params REAL for single precision flavors
 DOUBLE PRECISION for double precision flavors.

Array, size *nparams*. Specifies algorithm parameters. If an entry is less than 0.0, that entry will be filled with the default value used for that parameter. Only positions up to *nparams* are accessed; defaults are used for higher-numbered parameters. If defaults are acceptable, you can pass *nparams* = 0, which prevents the source code from accessing the *params* argument.

params(1) : Whether to perform iterative refinement or not. Default: 1.0 (for single precision flavors), 1.0D+0 (for double precision flavors).

=0.0 No refinement is performed and no error bounds are computed.

=1.0 Use the double-precision refinement algorithm, possibly with doubled-single computations if the compilation environment does not support double precision.

(Other values are reserved for future use.)

params(2) : Maximum number of residual computations allowed for refinement.

Default 10.0

Aggressive Set to 100.0 to permit convergence using approximate factorizations or factorizations other than *LU*. If the factorization uses a technique other than Gaussian elimination, the guarantees in *err_bnds_norm* and *err_bnds_comp* may no longer be trustworthy.

params(3) : Flag determining if the code will attempt to find a solution with a small componentwise relative error in the double-precision algorithm. Positive is true, 0.0 is false. Default: 1.0 (attempt componentwise convergence).

iwork INTEGER. Workspace array, size at least $\max(1, n)$; used in real flavors only.

rwork REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Workspace array, size at least $\max(1, 3*n)$; used in complex flavors only.

Output Parameters

x REAL for *sporfsv*
DOUBLE PRECISION for *dporfsv*
COMPLEX for *cporfsv*
DOUBLE COMPLEX for *zporfsv*.
The improved solution matrix *X*.

rcond REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Reciprocal scaled condition number. An estimate of the reciprocal Skeel condition number of the matrix *A* after equilibration (if done). If *rcond* is less than the machine precision, in particular, if *rcond* = 0, the matrix is singular to working precision. Note that the error may still be small even if this number is very small and the matrix appears ill-conditioned.

berr REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, size at least $\max(1, nrhs)$. Contains the componentwise relative backward error for each solution vector $x(j)$, that is, the smallest relative change in any element of *A* or *B* that makes $x(j)$ an exact solution.

err_bnds_norm REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array of size *nrhs* by *n_err_bnds*. For each right-hand side, contains information about various error bounds and condition numbers corresponding to the normwise relative error, which is defined as follows:
Normwise relative error in the *i*-th solution vector

$$\frac{\max_j |X_{true_{ji}} - X_{ji}|}{\max_j |X_{ji}|}$$

The array is indexed by the type of error information as described below. There are currently up to three pieces of information returned.

The first index in `err_bnds_norm(i,:)` corresponds to the *i*-th right-hand side.

The second index in `err_bnds_norm(:,err)` contains the following three fields:

<code>err=1</code>	"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold <code>sqrt(n)*slamch(ε)</code> for single precision flavors and <code>sqrt(n)*dlamch(ε)</code> for double precision flavors.
<code>err=2</code>	"Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold <code>sqrt(n)*slamch(ε)</code> for single precision flavors and <code>sqrt(n)*dlamch(ε)</code> for double precision flavors. This error bound should only be trusted if the previous boolean is true.
<code>err=3</code>	Reciprocal condition number. Estimated normwise reciprocal condition number. Compared with the threshold <code>sqrt(n)*slamch(ε)</code> for single precision flavors and <code>sqrt(n)*dlamch(ε)</code> for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix <i>Z</i> are $\ Z\ _{\infty} \cdot \ Z^{-1}\ _{\infty}$ <p>Let $z=s*a$, where <i>s</i> scales each row by a power of the radix so all absolute row sums of <i>z</i> are approximately 1.</p>

`err_bnds_comp`

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array of size *nrhs* by *n_err_bnds*. For each right-hand side, contains information about various error bounds and condition numbers corresponding to the componentwise relative error, which is defined as follows:

Componentwise relative error in the *i*-th solution vector:

$$\max_j \frac{|X_{true_{ji}} - X_{ji}|}{|X_{ji}|}$$

The array is indexed by the right-hand side i , on which the componentwise relative error depends, and by the type of error information as described below. There are currently up to three pieces of information returned for each right-hand side. If componentwise accuracy is not requested ($params(3) = 0.0$), then `err_bnds_comp` is not accessed. If $n_err_bnds < 3$, then at most the first $(:, n_err_bnds)$ entries are returned.

The first index in `err_bnds_comp(i, :)` corresponds to the i -th right-hand side.

The second index in `err_bnds_comp(:, err)` contains the following three fields:

<code>err=1</code>	"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold $\sqrt{n} * \text{slamch}(\epsilon)$ for single precision flavors and $\sqrt{n} * \text{dlamch}(\epsilon)$ for double precision flavors.
<code>err=2</code>	"Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold $\sqrt{n} * \text{slamch}(\epsilon)$ for single precision flavors and $\sqrt{n} * \text{dlamch}(\epsilon)$ for double precision flavors. This error bound should only be trusted if the previous boolean is true.
<code>err=3</code>	Reciprocal condition number. Estimated componentwise reciprocal condition number. Compared with the threshold $\sqrt{n} * \text{slamch}(\epsilon)$ for single precision flavors and $\sqrt{n} * \text{dlamch}(\epsilon)$ for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix Z are $\ Z\ _{\infty} \cdot \ Z^{-1}\ _{\infty}$ <p>Let $z = s * (a * \text{diag}(x))$, where x is the solution for the current right-hand side and s scales each row of $a * \text{diag}(x)$ by a power of the radix so all absolute row sums of z are approximately 1.</p>

`params`

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Output parameter only if the input contains erroneous values, namely in `params(1)`, `params(2)`, or `params(3)`. In such a case, the corresponding elements of `params` are filled with default values on output.

info INTEGER. If *info* = 0, the execution is successful. The solution to every right-hand side is guaranteed.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If $0 < \text{info} \leq n$: $U_{\text{info}, \text{info}}$ is exactly zero. The factorization has been completed, but the factor *U* is exactly singular, so the solution and error bounds could not be computed; *rcond* = 0 is returned.

If *info* = *n*+*j*: The solution corresponding to the *j*-th right-hand side is not guaranteed. The solutions corresponding to other right-hand sides *k* with *k* > *j* may not be guaranteed as well, but only the first such right-hand side is reported. If a small componentwise error is not requested *params*(3) = 0.0, then the *j*-th right-hand side is the first with a normwise error bound that is not guaranteed (the smallest *j* such that $\text{err_bnds_norm}(j, 1) = 0.0$ or $\text{err_bnds_comp}(j, 1) = 0.0$. See the definition of *err_bnds_norm* and *err_bnds_comp* for *err* = 1. To get information about all of the right-hand sides, check *err_bnds_norm* or *err_bnds_comp*.

Description

The routine performs an iterative refinement of the solution to a system of linear equations $A \cdot X = B$ with a symmetric (Hermitian) positive definite matrix *A*, with multiple right-hand sides. For each computed solution vector *x*, the routine computes the *component-wise backward error* β . This error is the smallest relative perturbation in elements of *A* and *b* such that *x* is the exact solution of the perturbed system:

$$|\delta a_{ij}| \leq \beta |a_{ij}|, \quad |\delta b_i| \leq \beta |b_i| \quad \text{such that} \quad (A + \delta A) x = (b + \delta b).$$

Finally, the routine estimates the *component-wise forward error* in the computed solution

$$\|x - x_e\|_\infty / \|x\|_\infty$$

where x_e is the exact solution.

Before calling this routine:

- call the factorization routine [?pptrf](#)

- call the solver routine [?pptrs](#).

Input Parameters

<i>uplo</i>	<p>CHARACTER*1. Must be 'U' or 'L'.</p> <p>Indicates how the input matrix <i>A</i> has been factored:</p> <p>If <i>uplo</i> = 'U', the upper triangle of <i>A</i> is stored.</p> <p>If <i>uplo</i> = 'L', the lower triangle of <i>A</i> is stored.</p>
<i>n</i>	<p>INTEGER. The order of the matrix <i>A</i>; $n \geq 0$.</p>
<i>nrhs</i>	<p>INTEGER. The number of right-hand sides; $nrhs \geq 0$.</p>
<i>ap, afp, b, x, work</i>	<p>REAL for <i>spprfs</i></p> <p>DOUBLE PRECISION for <i>dpprfs</i></p> <p>COMPLEX for <i>cpprfs</i></p> <p>DOUBLE COMPLEX for <i>zpprfs</i>.</p> <p>Arrays:</p> <p><i>ap</i>(*) contains the original matrix <i>A</i> in a packed format, as supplied to ?pptrf.</p> <p><i>afp</i>(*) contains the factored matrix <i>A</i> in a packed format, as returned by ?pptrf.</p> <p><i>b</i>(<i>ldb</i>,*) contains the right-hand side matrix <i>B</i>.</p> <p><i>x</i>(<i>ldx</i>,*) contains the solution matrix <i>X</i>.</p> <p><i>work</i>(*) is a workspace array.</p> <p>The dimension of arrays <i>ap</i> and <i>afp</i> must be at least $\max(1, n(n+1)/2)$; the second dimension of <i>b</i> and <i>x</i> must be at least $\max(1, nrhs)$; the dimension of <i>work</i> must be at least $\max(1, 3*n)$ for real flavors and $\max(1, 2*n)$ for complex flavors.</p>
<i>ldb</i>	<p>INTEGER. The leading dimension of <i>b</i>; $ldb \geq \max(1, n)$.</p>
<i>ldx</i>	<p>INTEGER. The leading dimension of <i>x</i>; $ldx \geq \max(1, n)$.</p>
<i>iwork</i>	<p>INTEGER. Workspace array, size at least $\max(1, n)$.</p>

<i>ferr, berr</i>	<p>REAL for single precision flavors.</p> <p>DOUBLE PRECISION for double precision flavors.</p>

Arrays, size at least $\max(1, nrhs)$. Contain the component-wise forward and backward errors, respectively, for each solution vector.

info

INTEGER. If *info*=0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `pprfs` interface are as follows:

<i>ap</i>	Holds the array <i>A</i> of size $(n*(n+1)/2)$.
<i>afp</i>	Holds the array <i>AF</i> of size $(n*(n+1)/2)$.
<i>b</i>	Holds the matrix <i>B</i> of size $(n, nrhs)$.
<i>x</i>	Holds the matrix <i>X</i> of size $(n, nrhs)$.
<i>ferr</i>	Holds the vector of length $(nrhs)$.
<i>berr</i>	Holds the vector of length $(nrhs)$.
<i>uplo</i>	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The bounds returned in *ferr* are not rigorous, but in practice they almost always overestimate the actual error.

For each right-hand side, computation of the backward error involves a minimum of $4n^2$ floating-point operations (for real flavors) or $16n^2$ operations (for complex flavors). In addition, each step of iterative refinement involves $6n^2$ operations (for real flavors) or $24n^2$ operations (for complex flavors); the number of iterations may range from 1 to 5.

Estimating the forward error involves solving a number of systems of linear equations $A*x = b$; the number of systems is usually 4 or 5 and never more than 11. Each solution requires approximately $2n^2$ floating-point operations for real flavors or $8n^2$ for complex flavors.

Description

The routine performs an iterative refinement of the solution to a system of linear equations $A * X = B$ with a symmetric (Hermitian) positive definite band matrix A , with multiple right-hand sides. For each computed solution vector x , the routine computes the *component-wise backward error* β . This error is the smallest relative perturbation in elements of A and b such that x is the exact solution of the perturbed system:

$$|\delta a_{ij}| \leq \beta |a_{ij}|, \quad |\delta b_i| \leq \beta |b_i| \text{ such that } (A + \delta A) x = (b + \delta b).$$

Finally, the routine estimates the *component-wise forward error* in the computed solution $\|x - x_e\|_\infty / \|x\|_\infty$ (here x_e is the exact solution).

Before calling this routine:

- call the factorization routine [?pbtrf](#)
- call the solver routine [?pbtrs](#).

Input Parameters

<i>uplo</i>	CHARACTER*1. Must be 'U' or 'L'. Indicates how the input matrix A has been factored: If <i>uplo</i> = 'U', the upper triangle of A is stored. If <i>uplo</i> = 'L', the lower triangle of A is stored.
<i>n</i>	INTEGER. The order of the matrix A ; $n \geq 0$.
<i>kd</i>	INTEGER. The number of superdiagonals or subdiagonals in the matrix A ; $kd \geq 0$.
<i>nrhs</i>	INTEGER. The number of right-hand sides; $nrhs \geq 0$.
<i>ab,afb,b,x,work</i>	REAL for spbrfs DOUBLE PRECISION for dpbrfs COMPLEX for cpbrfs DOUBLE COMPLEX for zpbrfs. Arrays: <i>ab(ldab,*)</i> contains the original band matrix A , as supplied to ?pbtrf . <i>afb(ldafb,*)</i> contains the factored band matrix A , as returned by ?pbtrf . <i>b(ldb,*)</i> contains the right-hand side matrix B . <i>x(ldx,*)</i> contains the solution matrix X . <i>work(*)</i> is a workspace array.

The second dimension of *ab* and *afb* must be at least $\max(1, n)$; the second dimension of *b* and *x* must be at least $\max(1, nrhs)$; the dimension of *work* must be at least $\max(1, 3*n)$ for real flavors and $\max(1, 2*n)$ for complex flavors.

<i>ldab</i>	INTEGER. The leading dimension of <i>ab</i> ; $ldab \geq kd + 1$.
<i>ldafb</i>	INTEGER. The leading dimension of <i>afb</i> ; $ldafb \geq kd + 1$.
<i>ldb</i>	INTEGER. The leading dimension of <i>b</i> ; $ldb \geq \max(1, n)$.
<i>ldx</i>	INTEGER. The leading dimension of <i>x</i> ; $ldx \geq \max(1, n)$.
<i>iwork</i>	INTEGER. Workspace array, size at least $\max(1, n)$.
<i>rwork</i>	REAL for <i>cpbrfs</i> DOUBLE PRECISION for <i>zpbrfs</i> . Workspace array, size at least $\max(1, n)$.

Output Parameters

<i>x</i>	The refined solution matrix <i>X</i> .
<i>ferr, berr</i>	REAL for single precision flavors. DOUBLE PRECISION for double precision flavors. Arrays, size at least $\max(1, nrhs)$. Contain the component-wise forward and backward errors, respectively, for each solution vector.
<i>info</i>	INTEGER. If <i>info</i> = 0, the execution is successful. If <i>info</i> = - <i>i</i> , the <i>i</i> -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine *pbrfs* interface are as follows:

<i>ab</i>	Holds the array <i>A</i> of size $(kd+1, n)$.
<i>afb</i>	Holds the array <i>AF</i> of size $(kd+1, n)$.
<i>b</i>	Holds the matrix <i>B</i> of size $(n, nrhs)$.
<i>x</i>	Holds the matrix <i>X</i> of size $(n, nrhs)$.
<i>ferr</i>	Holds the vector of length $(nrhs)$.
<i>berr</i>	Holds the vector of length $(nrhs)$.
<i>uplo</i>	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The bounds returned in *ferr* are not rigorous, but in practice they almost always overestimate the actual error.

For each right-hand side, computation of the backward error involves a minimum of $8n*kd$ floating-point operations (for real flavors) or $32n*kd$ operations (for complex flavors). In addition, each step of iterative refinement involves $12n*kd$ operations (for real flavors) or $48n*kd$ operations (for complex flavors); the number of iterations may range from 1 to 5.

Estimating the forward error involves solving a number of systems of linear equations $A*x = b$; the number is usually 4 or 5 and never more than 11. Each solution requires approximately $4n*kd$ floating-point operations for real flavors or $16n*kd$ for complex flavors.

Description

The routine performs an iterative refinement of the solution to a system of linear equations $A \cdot X = B$ with a symmetric full-storage matrix A , with multiple right-hand sides. For each computed solution vector x , the routine computes the *component-wise backward error* β . This error is the smallest relative perturbation in elements of A and b such that x is the exact solution of the perturbed system:

$$|\delta a_{ij}| \leq \beta |a_{ij}|, \quad |\delta b_i| \leq \beta |b_i| \text{ such that } (A + \delta A) x = (b + \delta b).$$

Finally, the routine estimates the *component-wise forward error* in the computed solution $\|x - x_e\|_\infty / \|x\|_\infty$ (here x_e is the exact solution).

Before calling this routine:

- call the factorization routine [?sytrf](#)
- call the solver routine [?sytrs](#).

Input Parameters

<i>uplo</i>	CHARACTER*1. Must be 'U' or 'L'. If <i>uplo</i> = 'U', the upper triangle of A is stored. If <i>uplo</i> = 'L', the lower triangle of A is stored.
<i>n</i>	INTEGER. The order of the matrix A ; $n \geq 0$.
<i>nrhs</i>	INTEGER. The number of right-hand sides; $nrhs \geq 0$.
<i>a, af, b, x, work</i>	REAL for ssyrfs DOUBLE PRECISION for dsyrfs COMPLEX for csyrfs DOUBLE COMPLEX for zsyrfs. Arrays: <i>a(lda,*)</i> contains the original matrix A , as supplied to ?sytrf . <i>af(ldaf,*)</i> contains the factored matrix A , as returned by ?sytrf . <i>b(ldb,*)</i> contains the right-hand side matrix B . <i>x(ldx,*)</i> contains the solution matrix X . <i>work(*)</i> is a workspace array. The second dimension of <i>a</i> and <i>af</i> must be at least $\max(1, n)$; the second dimension of <i>b</i> and <i>x</i> must be at least $\max(1, nrhs)$; the dimension of <i>work</i> must be at least $\max(1, 3*n)$ for real flavors and $\max(1, 2*n)$ for complex flavors.
<i>lda</i>	INTEGER. The leading dimension of <i>a</i> ; $lda \geq \max(1, n)$.
<i>ldaf</i>	INTEGER. The leading dimension of <i>af</i> ; $ldaf \geq \max(1, n)$.

<i>ldb</i>	INTEGER. The leading dimension of <i>b</i> ; $ldb \geq \max(1, n)$.
<i>ldx</i>	INTEGER. The leading dimension of <i>x</i> ; $ldx \geq \max(1, n)$.
<i>ipiv</i>	INTEGER. Array, size at least $\max(1, n)$. The <i>ipiv</i> array, as returned by ? sytrf .
<i>iwork</i>	INTEGER. Workspace array, size at least $\max(1, n)$.
<i>rwork</i>	REAL for <code>csyrfs</code> DOUBLE PRECISION for <code>zsyrfs</code> . Workspace array, size at least $\max(1, n)$.

Output Parameters

<i>x</i>	The refined solution matrix <i>X</i> .
<i>ferr, berr</i>	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Arrays, size at least $\max(1, nrhs)$. Contain the component-wise forward and backward errors, respectively, for each solution vector.
<i>info</i>	INTEGER. If <i>info</i> = 0, the execution is successful. If <i>info</i> = - <i>i</i> , the <i>i</i> -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `syrfs` interface are as follows:

<i>a</i>	Holds the matrix <i>A</i> of size (n, n) .
<i>af</i>	Holds the matrix <i>AF</i> of size (n, n) .
<i>ipiv</i>	Holds the vector of length <i>n</i> .
<i>b</i>	Holds the matrix <i>B</i> of size $(n, nrhs)$.
<i>x</i>	Holds the matrix <i>X</i> of size $(n, nrhs)$.
<i>ferr</i>	Holds the vector of length $(nrhs)$.
<i>berr</i>	Holds the vector of length $(nrhs)$.
<i>uplo</i>	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The bounds returned in *ferr* are not rigorous, but in practice they almost always overestimate the actual error.

For each right-hand side, computation of the backward error involves a minimum of $4n^2$ floating-point operations (for real flavors) or $16n^2$ operations (for complex flavors). In addition, each step of iterative refinement involves $6n^2$ operations (for real flavors) or $24n^2$ operations (for complex flavors); the number of iterations may range from 1 to 5. Estimating the forward error involves solving a number of systems of linear equations $A*x = b$; the number is usually 4 or 5 and never more than 11. Each solution requires approximately $2n^2$ floating-point operations for real flavors or $8n^2$ for complex flavors.

Description

The routine improves the computed solution to a system of linear equations when the coefficient matrix is symmetric indefinite, and provides error bounds and backward error estimates for the solution. In addition to a normwise error bound, the code provides a maximum componentwise error bound, if possible. See comments for `err_bnds_norm` and `err_bnds_comp` for details of the error bounds.

The original system of linear equations may have been equilibrated before calling this routine, as described by the parameters `equed` and `s` below. In this case, the solution and error bounds returned are for the original unequilibrated system.

Input Parameters

<code>uplo</code>	CHARACTER*1. Must be 'U' or 'L'.
	Indicates whether the upper or lower triangular part of A is stored:
	If <code>uplo = 'U'</code> , the upper triangle of A is stored.
	If <code>uplo = 'L'</code> , the lower triangle of A is stored.
<code>equed</code>	CHARACTER*1. Must be 'N' or 'Y'.
	Specifies the form of equilibration that was done to A before calling this routine.
	If <code>equed = 'N'</code> , no equilibration was done.

If *equed* = 'Y', both row and column equilibration was done, that is, *A* has been replaced by *diag(s) * A * diag(s)*. The right-hand side *B* has been changed accordingly.

n INTEGER. The number of linear equations; the order of the matrix *A*; $n \geq 0$.

nrhs INTEGER. The number of right-hand sides; the number of columns of the matrices *B* and *X*; $nrhs \geq 0$.

a, *af*, *b*, *work* REAL for ssyrfsx
DOUBLE PRECISION for dsyrfsx
COMPLEX for csyrfsx
DOUBLE COMPLEX for zsyrfsx.

Arrays: *a(lda,*)*, *af(ldaf,*)*, *b ldb,*)*, *work(*)*.

The array *a* contains the symmetric/Hermitian matrix *A* as specified by *uplo*. If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of *a* contains the upper triangular part of the matrix *A* and the strictly lower triangular part of *a* is not referenced. If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of *a* contains the lower triangular part of the matrix *A* and the strictly upper triangular part of *a* is not referenced. The second dimension of *a* must be at least $\max(1, n)$.

The array *af* contains the triangular factor *L* or *U* from the Cholesky factorization $A = U^T * U$ or $A = L * L^T$ as computed by *ssytrf* for real flavors or *dsytrf* for complex flavors.

The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least $\max(1, nrhs)$.

work()* is a workspace array. The dimension of *work* must be at least $\max(1, 4 * n)$ for real flavors, and at least $\max(1, 2 * n)$ for complex flavors.

lda INTEGER. The leading dimension of *a*; $lda \geq \max(1, n)$.

ldaf INTEGER. The leading dimension of *af*; $ldaf \geq \max(1, n)$.

ipiv INTEGER.

Array, size at least $\max(1, n)$. Contains details of the interchanges and the block structure of *D* as determined by *ssytrf* for real flavors or *dsytrf* for complex flavors.

s REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, size (*n*). The array *s* contains the scale factors for *A*.
If *equed* = 'N', *s* is not accessed.
If *equed* = 'Y', each element of *s* must be positive.

Each element of s should be a power of the radix to ensure a reliable solution and error estimates. Scaling by powers of the radix does not cause rounding errors unless the result underflows or overflows. Rounding errors during scaling lead to refining with a matrix that is not equivalent to the input matrix, producing error estimates that may not be reliable.

<i>ldb</i>	INTEGER. The leading dimension of the array <i>b</i> ; $ldb \geq \max(1, n)$.						
<i>x</i>	<p>REAL for ssyrfsx</p> <p>DOUBLE PRECISION for dsyrfsx</p> <p>COMPLEX for csyrfsx</p> <p>DOUBLE COMPLEX for zsyrfxs.</p> <p>Array, size <i>ldx</i> by *.</p> <p>The solution matrix <i>X</i> as computed by ?sytrs</p>						
<i>ldx</i>	INTEGER. The leading dimension of the output array <i>x</i> ; $ldx \geq \max(1, n)$.						
<i>n_err_bnds</i>	INTEGER. Number of error bounds to return for each right hand side and each type (normwise or componentwise). See <i>err_bnds_norm</i> and <i>err_bnds_comp</i> descriptions in <i>Output Arguments</i> section below.						
<i>nparams</i>	INTEGER. Specifies the number of parameters set in <i>params</i> . If ≤ 0 , the <i>params</i> array is never referenced and default values are used.						
<i>params</i>	<p>REAL for single precision flavors</p> <p>DOUBLE PRECISION for double precision flavors.</p> <p>Array, size <i>nparams</i>. Specifies algorithm parameters. If an entry is less than 0.0, that entry will be filled with the default value used for that parameter. Only positions up to <i>nparams</i> are accessed; defaults are used for higher-numbered parameters. If defaults are acceptable, you can pass <i>nparams</i> = 0, which prevents the source code from accessing the <i>params</i> argument.</p> <p><i>params</i>(1) : Whether to perform iterative refinement or not. Default: 1.0 (for single precision flavors), 1.0D+0 (for double precision flavors).</p> <table> <tr> <td>=0.0</td><td>No refinement is performed and no error bounds are computed.</td></tr> <tr> <td>=1.0</td><td>Use the double-precision refinement algorithm, possibly with doubled-single computations if the compilation environment does not support double precision.</td></tr> </table> <p>(Other values are reserved for future use.)</p> <p><i>params</i>(2) : Maximum number of residual computations allowed for refinement.</p> <table> <tr> <td>Default</td><td>10.0</td></tr> </table>	=0.0	No refinement is performed and no error bounds are computed.	=1.0	Use the double-precision refinement algorithm, possibly with doubled-single computations if the compilation environment does not support double precision.	Default	10.0
=0.0	No refinement is performed and no error bounds are computed.						
=1.0	Use the double-precision refinement algorithm, possibly with doubled-single computations if the compilation environment does not support double precision.						
Default	10.0						

Aggressive Set to 100.0 to permit convergence using approximate factorizations or factorizations other than *LU*. If the factorization uses a technique other than Gaussian elimination, the guarantees in *err_bnds_norm* and *err_bnds_comp* may no longer be trustworthy.

params(3) : Flag determining if the code will attempt to find a solution with a small componentwise relative error in the double-precision algorithm. Positive is true, 0.0 is false. Default: 1.0 (attempt componentwise convergence).

iwork INTEGER. Workspace array, size at least $\max(1, n)$; used in real flavors only.

rwork REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Workspace array, size at least $\max(1, 3*n)$; used in complex flavors only.

Output Parameters

x REAL for *ssyrfsx*
DOUBLE PRECISION for *dsyrfsx*
COMPLEX for *csyrfsx*
DOUBLE COMPLEX for *zsyrfsx*.
The improved solution matrix *X*.

rcond REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Reciprocal scaled condition number. An estimate of the reciprocal Skeel condition number of the matrix *A* after equilibration (if done). If *rcond* is less than the machine precision, in particular, if *rcond* = 0, the matrix is singular to working precision. Note that the error may still be small even if this number is very small and the matrix appears ill-conditioned.

berr REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, size at least $\max(1, nrhs)$. Contains the componentwise relative backward error for each solution vector $x(j)$, that is, the smallest relative change in any element of *A* or *B* that makes $x(j)$ an exact solution.

err_bnds_norm REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array of size *nrhs* by *n_err_bnds*. For each right-hand side, contains information about various error bounds and condition numbers corresponding to the normwise relative error, which is defined as follows:
Normwise relative error in the *i*-th solution vector

$$\frac{\max_j |X_{true_{ji}} - X_{ji}|}{\max_j |X_{ji}|}$$

The array is indexed by the type of error information as described below. There are currently up to three pieces of information returned.

The first index in `err_bnds_norm(i,:)` corresponds to the *i*-th right-hand side.

The second index in `err_bnds_norm(:,err)` contains the following three fields:

<code>err=1</code>	"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold $\sqrt{n} * \text{slamch}(\epsilon)$ for single precision flavors and $\sqrt{n} * \text{dlamch}(\epsilon)$ for double precision flavors.
<code>err=2</code>	"Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold $\sqrt{n} * \text{slamch}(\epsilon)$ for single precision flavors and $\sqrt{n} * \text{dlamch}(\epsilon)$ for double precision flavors. This error bound should only be trusted if the previous boolean is true.
<code>err=3</code>	Reciprocal condition number. Estimated normwise reciprocal condition number. Compared with the threshold $\sqrt{n} * \text{slamch}(\epsilon)$ for single precision flavors and $\sqrt{n} * \text{dlamch}(\epsilon)$ for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix <i>Z</i> are:

$$\|Z\|_{\infty} \cdot \|Z^{-1}\|_{\infty}$$

`err_bnds_comp`

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array of size *nrhs* by *n_err_bnds*. For each right-hand side, contains information about various error bounds and condition numbers corresponding to the componentwise relative error, which is defined as follows:

Componentwise relative error in the *i*-th solution vector:

$$\max_j \frac{|X_{true_{ji}} - X_{ji}|}{|X_{ji}|}$$

The array is indexed by the right-hand side i , on which the componentwise relative error depends, and by the type of error information as described below. There are currently up to three pieces of information returned for each right-hand side. If componentwise accuracy is not requested ($params(3) = 0.0$), then `err_bnds_comp` is not accessed. If $n_err_bnds < 3$, then at most the first $(:, n_err_bnds)$ entries are returned.

The first index in `err_bnds_comp(i, :)` corresponds to the i -th right-hand side.

The second index in `err_bnds_comp(:, err)` contains the following three fields:

<code>err=1</code>	"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold $\sqrt{n} * slamch(\epsilon)$ for single precision flavors and $\sqrt{n} * dlamch(\epsilon)$ for double precision flavors.
<code>err=2</code>	"Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold $\sqrt{n} * slamch(\epsilon)$ for single precision flavors and $\sqrt{n} * dlamch(\epsilon)$ for double precision flavors. This error bound should only be trusted if the previous boolean is true.
<code>err=3</code>	Reciprocal condition number. Estimated componentwise reciprocal condition number. Compared with the threshold $\sqrt{n} * slamch(\epsilon)$ for single precision flavors and $\sqrt{n} * dlamch(\epsilon)$ for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix Z are: $\ Z\ _{\infty} \cdot \ Z^{-1}\ _{\infty}$ <p>Let $z = s * (a * \text{diag}(x))$, where x is the solution for the current right-hand side and s scales each row of $a * \text{diag}(x)$ by a power of the radix so all absolute row sums of z are approximately 1.</p>

`params`

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Output parameter only if the input contains erroneous values, namely, in `params(1)`, `params(2)`, `params(3)`. In such a case, the corresponding elements of `params` are filled with default values on output.

`info`

INTEGER. If `info = 0`, the execution is successful. The solution to every right-hand side is guaranteed.

If `info = -i`, the i -th parameter had an illegal value.

If $0 < \text{info} \leq n$: $U_{\text{info},\text{info}}$ is exactly zero. The factorization has been completed, but the factor U is exactly singular, so the solution and error bounds could not be computed; $\text{rcond} = 0$ is returned.

If $\text{info} = n+j$: The solution corresponding to the j -th right-hand side is not guaranteed. The solutions corresponding to other right-hand sides k with $k > j$ may not be guaranteed as well, but only the first such right-hand side is reported. If a small componentwise error is not requested $\text{params}(3) = 0.0$, then the j -th right-hand side is the first with a normwise error bound that is not guaranteed (the smallest j such that $\text{err_bnds_norm}(j,1) = 0.0$ or $\text{err_bnds_comp}(j,1) = 0.0$. See the definition of err_bnds_norm and err_bnds_comp for $\text{err} = 1$. To get information about all of the right-hand sides, check err_bnds_norm or err_bnds_comp .

```

Include Files

- `mk1.fi`, `lapack.f90`

Description

The routine performs an iterative refinement of the solution to a system of linear equations $A^*X = B$ with a complex Hermitian full-storage matrix A , with multiple right-hand sides. For each computed solution vector x , the routine computes the *component-wise backward error* β . This error is the smallest relative perturbation in elements of A and b such that x is the exact solution of the perturbed system:

$$|\delta a_{ij}| \leq \beta |a_{ij}|, \quad |\delta b_i| \leq \beta |b_i| \quad \text{such that} \quad (A + \delta A)x = (b + \delta b).$$

Finally, the routine estimates the *component-wise forward error* in the computed solution $\|x - x_e\|_\infty / \|x\|_\infty$ (here x_e is the exact solution).

Before calling this routine:

- call the factorization routine [?hetrf](#)
- call the solver routine [?hetrs](#).

Input Parameters

uplo

CHARACTER*1. Must be 'U' or 'L'.

If *uplo* = 'U', the upper triangle of A is stored.

	If <code>uplo = 'L'</code> , the lower triangle of A is stored.
<code>n</code>	INTEGER. The order of the matrix A ; $n \geq 0$.
<code>nrhs</code>	INTEGER. The number of right-hand sides; $nrhs \geq 0$.
<code>a, af, b, x, work</code>	COMPLEX for <code>cherfs</code> DOUBLE COMPLEX for <code>zherfs</code> . Arrays: <code>a</code> (size <code>lda</code> by <code>*</code>) contains the original matrix A , as supplied to ?hetrf . <code>af</code> (size <code>ldaf</code> by <code>*</code>) contains the factored matrix A , as returned by ?hetrf . <code>b</code> (size <code>ldb</code> by <code>*</code>) contains the right-hand side matrix B . <code>x</code> (size <code>ldx</code> by <code>*</code>) contains the solution matrix X . <code>work</code> (<code>*</code>) is a workspace array. The second dimension of <code>a</code> and <code>af</code> must be at least $\max(1, n)$; the second dimension of <code>b</code> and <code>x</code> must be at least $\max(1, nrhs)$; the dimension of <code>work</code> must be at least $\max(1, 2 * n)$.
<code>lda</code>	INTEGER. The leading dimension of <code>a</code> ; $lda \geq \max(1, n)$.
<code>ldaf</code>	INTEGER. The leading dimension of <code>af</code> ; $ldaf \geq \max(1, n)$.
<code>ldb</code>	INTEGER. The leading dimension of <code>b</code> ; $ldb \geq \max(1, n)$.
<code>ldx</code>	INTEGER. The leading dimension of <code>x</code> ; $ldx \geq \max(1, n)$.
<code>ipiv</code>	INTEGER. Array, size at least $\max(1, n)$. The <code>ipiv</code> array, as returned by ?hetrf .
<code>rwork</code>	REAL for <code>cherfs</code> DOUBLE PRECISION for <code>zherfs</code> . Workspace array, size at least $\max(1, n)$.

Output Parameters

<code>x</code>	The refined solution matrix X .
<code>ferr, berr</code>	REAL for <code>cherfs</code> DOUBLE PRECISION for <code>zherfs</code> . Arrays, size at least $\max(1, nrhs)$. Contain the component-wise forward and backward errors, respectively, for each solution vector.
<code>info</code>	INTEGER. If <code>info = 0</code> , the execution is successful. If <code>info = -i</code> , the i -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `herfs` interface are as follows:

<code>a</code>	Holds the matrix A of size (n, n) .
<code>af</code>	Holds the matrix AF of size (n, n) .
<code>ipiv</code>	Holds the vector of length n .
<code>b</code>	Holds the matrix B of size $(n, nrhs)$.
<code>x</code>	Holds the matrix X of size $(n, nrhs)$.
<code>ferr</code>	Holds the vector of length $(nrhs)$.
<code>berr</code>	Holds the vector of length $(nrhs)$.
<code>uplo</code>	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The bounds returned in `ferr` are not rigorous, but in practice they almost always overestimate the actual error.

For each right-hand side, computation of the backward error involves a minimum of $16n^2$ operations. In addition, each step of iterative refinement involves $24n^2$ operations; the number of iterations may range from 1 to 5.

Estimating the forward error involves solving a number of systems of linear equations $A*x = b$; the number is usually 4 or 5 and never more than 11. Each solution requires approximately $8n^2$ floating-point operations.

The second dimension of <code>b</code> must be at least $\max(1, nrhs)$.</p> <p><code>work(*)</code> is a workspace array. The dimension of <code>work</code> must be at least $\max(1, 2 * n)$.</p>
<code>lda</code>	<p>INTEGER. The leading dimension of <code>a</code>; $lda \geq \max(1, n)$.</p>

<i>ldaf</i>	INTEGER. The leading dimension of <i>af</i> ; $ldaf \geq \max(1, n)$.
<i>ipiv</i>	INTEGER. Array, size at least $\max(1, n)$. Contains details of the interchanges and the block structure of <i>D</i> as determined by ssytrf for real flavors or dsytrf for complex flavors.
<i>s</i>	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Array, size (<i>n</i>). The array <i>s</i> contains the scale factors for <i>A</i> . If <i>equed</i> = 'N', <i>s</i> is not accessed. If <i>equed</i> = 'Y', each element of <i>s</i> must be positive. Each element of <i>s</i> should be a power of the radix to ensure a reliable solution and error estimates. Scaling by powers of the radix does not cause rounding errors unless the result underflows or overflows. Rounding errors during scaling lead to refining with a matrix that is not equivalent to the input matrix, producing error estimates that may not be reliable.
<i>ldb</i>	INTEGER. The leading dimension of the array <i>b</i> ; $ldb \geq \max(1, n)$.
<i>x</i>	COMPLEX for cherfsx DOUBLE COMPLEX for zherfsx . Array, size (<i>ldx</i> , *). The solution matrix <i>X</i> as computed by ?hetrs
<i>ldx</i>	INTEGER. The leading dimension of the output array <i>x</i> ; $ldx \geq \max(1, n)$.
<i>n_err_bnds</i>	INTEGER. Number of error bounds to return for each right hand side and each type (normwise or componentwise). See <i>err_bnds_norm</i> and <i>err_bnds_comp</i> descriptions in <i>Output Arguments</i> section below.
<i>nparams</i>	INTEGER. Specifies the number of parameters set in <i>params</i> . If ≤ 0 , the <i>params</i> array is never referenced and default values are used.
<i>params</i>	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Array, size <i>nparams</i> . Specifies algorithm parameters. If an entry is less than 0.0, that entry will be filled with the default value used for that parameter. Only positions up to <i>nparams</i> are accessed; defaults are used for higher-numbered parameters. If defaults are acceptable, you can pass <i>nparams</i> = 0, which prevents the source code from accessing the <i>params</i> argument. <i>params</i> (1) : Whether to perform iterative refinement or not. Default: 1.0 (for cherfsx), 1.0D+0 (for zherfsx). =0.0 No refinement is performed and no error bounds are computed.

=1.0 Use the double-precision refinement algorithm, possibly with doubled-single computations if the compilation environment does not support double precision.

(Other values are reserved for future use.)

params(2) : Maximum number of residual computations allowed for refinement.

Default 10

Aggressive Set to 100 to permit convergence using approximate factorizations or factorizations other than *LU*. If the factorization uses a technique other than Gaussian elimination, the guarantees in *err_bnds_norm* and *err_bnds_comp* may no longer be trustworthy.

params(3) : Flag determining if the code will attempt to find a solution with a small componentwise relative error in the double-precision algorithm. Positive is true, 0.0 is false. Default: 1.0 (attempt componentwise convergence).

rwork

REAL for *cherfsx*

DOUBLE PRECISION for *zherfsx*.

Workspace array, size at least $\max(1, 3*n)$.

Output Parameters

x

COMPLEX for *cherfsx*

DOUBLE COMPLEX for *zherfsx*.

The improved solution matrix *X*.

rcond

REAL for *cherfsx*

DOUBLE PRECISION for *zherfsx*.

Reciprocal scaled condition number. An estimate of the reciprocal Skeel condition number of the matrix *A* after equilibration (if done). If *rcond* is less than the machine precision, in particular, if *rcond* = 0, the matrix is singular to working precision. Note that the error may still be small even if this number is very small and the matrix appears ill-conditioned.

berr

REAL for *cherfsx*

DOUBLE PRECISION for *zherfsx*.

Array, size at least $\max(1, nrhs)$. Contains the componentwise relative backward error for each solution vector $x(j)$, that is, the smallest relative change in any element of *A* or *B* that makes $x(j)$ an exact solution.

err_bnds_norm

REAL for *cherfsx*

DOUBLE PRECISION for *zherfsx*.

Array of size *nrhs* by *n_err_bnds*. For each right-hand side, contains information about various error bounds and condition numbers corresponding to the normwise relative error, which is defined as follows:

Normwise relative error in the *i*-th solution vector

$$\frac{\max_j |X_{true_{ji}} - X_{ji}|}{\max_j |X_{ji}|}$$

The array is indexed by the type of error information as described below. There are currently up to three pieces of information returned.

The first index in *err_bnds_norm(i,:)* corresponds to the *i*-th right-hand side.

The second index in *err_bnds_norm(:,err)* contains the following three fields:

<i>err</i> =1	"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold $\sqrt{n} * \text{slamch}(\epsilon)$ for <i>cherfsx</i> and $\sqrt{n} * \text{dlamch}(\epsilon)$ for <i>zherfsx</i> .
<i>err</i> =2	"Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold $\sqrt{n} * \text{slamch}(\epsilon)$ for <i>cherfsx</i> and $\sqrt{n} * \text{dlamch}(\epsilon)$ for <i>zherfsx</i> . This error bound should only be trusted if the previous boolean is true.
<i>err</i> =3	Reciprocal condition number. Estimated normwise reciprocal condition number. Compared with the threshold $\sqrt{n} * \text{slamch}(\epsilon)$ for single precision flavors and $\sqrt{n} * \text{dlamch}(\epsilon)$ for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix <i>Z</i> are: $\ Z\ _{\infty} \cdot \ Z^{-1}\ _{\infty}$ <p>Let $z = s * a$, where <i>s</i> scales each row by a power of the radix so all absolute row sums of <i>z</i> are approximately 1.</p>

err_bnds_comp

REAL for *cherfsx*

DOUBLE PRECISION for *zherfsx*.

Array of size *nrhs* by *n_err_bnds*. For each right-hand side, contains information about various error bounds and condition numbers corresponding to the componentwise relative error, which is defined as follows:

Componentwise relative error in the *i*-th solution vector:

$$\max_j \frac{|X_{true_{ji}} - X_{ji}|}{|X_{ji}|}$$

The array is indexed by the right-hand side i , on which the componentwise relative error depends, and by the type of error information as described below. There are currently up to three pieces of information returned for each right-hand side. If componentwise accuracy is not requested ($params(3) = 0.0$), then `err_bnds_comp` is not accessed. If $n_err_bnds < 3$, then at most the first $(:, n_err_bnds)$ entries are returned.

The first index in `err_bnds_comp(i, :)` corresponds to the i -th right-hand side.

The second index in `err_bnds_comp(:, err)` contains the following three fields:

<code>err=1</code>	"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold $\sqrt{n} * slamch(\epsilon)$ for <code>cherfsx</code> and $\sqrt{n} * dlamch(\epsilon)$ for <code>zherfsx</code> .
<code>err=2</code>	"Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold $\sqrt{n} * slamch(\epsilon)$ for <code>cherfsx</code> and $\sqrt{n} * dlamch(\epsilon)$ for <code>zherfsx</code> . This error bound should only be trusted if the previous boolean is true.
<code>err=3</code>	Reciprocal condition number. Estimated componentwise reciprocal condition number. Compared with the threshold $\sqrt{n} * slamch(\epsilon)$ for single precision flavors and $\sqrt{n} * dlamch(\epsilon)$ for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix Z are:

$$\|Z\|_{\infty} \cdot \|Z^{-1}\|_{\infty}$$

Let $z = s * (a * \text{diag}(x))$, where x is the solution for the current right-hand side and s scales each row of $a * \text{diag}(x)$ by a power of the radix so all absolute row sums of z are approximately 1.

`params`

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Output parameter only if the input contains erroneous values, namely, in `params(1)`, `params(2)`, `params(3)`. In such a case, the corresponding elements of `params` are filled with default values on output.

info INTEGER. If *info* = 0, the execution is successful. The solution to every right-hand side is guaranteed.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If $0 < \text{info} \leq n$: $U_{\text{info},\text{info}}$ is exactly zero. The factorization has been completed, but the factor *U* is exactly singular, so the solution and error bounds could not be computed; *rcond* = 0 is returned.

If *info* = *n*+*j*: The solution corresponding to the *j*-th right-hand side is not guaranteed. The solutions corresponding to other right-hand sides *k* with *k* > *j* may not be guaranteed as well, but only the first such right-hand side is reported. If a small componentwise error is not requested *params*(3) = 0.0, then the *j*-th right-hand side is the first with a normwise error bound that is not guaranteed (the smallest *j* such that $\text{err_bnds_norm}(j,1) = 0.0$ or $\text{err_bnds_comp}(j,1) = 0.0$. See the definition of *err_bnds_norm* and *err_bnds_comp* for *err* = 1. To get information about all of the right-hand sides, check *err_bnds_norm* or *err_bnds_comp*.

Description

The routine performs an iterative refinement of the solution to a system of linear equations $A \cdot X = B$ with a packed symmetric matrix *A*, with multiple right-hand sides. For each computed solution vector *x*, the routine computes the *component-wise backward error* β . This error is the smallest relative perturbation in elements of *A* and *b* such that *x* is the exact solution of the perturbed system:

$$|\delta a_{ij}| \leq \beta |a_{ij}|, \quad |\delta b_i| \leq \beta |b_i| \text{ such that } (A + \delta A) x = (b + \delta b).$$

Finally, the routine estimates the *component-wise forward error* in the computed solution $\|x - x_e\|_\infty / \|x\|_\infty$ (here x_e is the exact solution).

Before calling this routine:

- call the factorization routine [?spturf](#)
- call the solver routine [?spturs](#).

Input Parameters

<i>uplo</i>	<p>CHARACTER*1. Must be 'U' or 'L'.</p> <p>If <i>uplo</i> = 'U', the upper triangle of <i>A</i> is stored.</p> <p>If <i>uplo</i> = 'L', the lower triangle of <i>A</i> is stored.</p>
<i>n</i>	INTEGER. The order of the matrix <i>A</i> ; $n \geq 0$.
<i>nrhs</i>	INTEGER. The number of right-hand sides; $nrhs \geq 0$.
<i>ap,afp,b,x,work</i>	<p>REAL for <i>ssprfs</i></p> <p>DOUBLE PRECISION for <i>dsprfs</i></p> <p>COMPLEX for <i>csprfs</i></p> <p>DOUBLE COMPLEX for <i>zsprfs</i>.</p> <p>Arrays:</p> <p><i>ap</i> (size *) contains the original packed matrix <i>A</i>, as supplied to ?spturf.</p> <p><i>afp</i> (size *) contains the factored packed matrix <i>A</i>, as returned by ?spturf.</p> <p><i>b</i>(size <i>ldb</i> by *) contains the right-hand side matrix <i>B</i>.</p> <p><i>x</i>(size <i>ldx</i> by *) contains the solution matrix <i>X</i>.</p> <p><i>work</i>(*) is a workspace array.</p> <p>The dimension of arrays <i>ap</i> and <i>afp</i> must be at least $\max(1, n(n+1)/2)$; the second dimension of <i>b</i> and <i>x</i> must be at least $\max(1, nrhs)$; the dimension of <i>work</i> must be at least $\max(1, 3*n)$ for real flavors and $\max(1, 2*n)$ for complex flavors.</p>
<i>ldb</i>	INTEGER. The leading dimension of <i>b</i> ; $ldb \geq \max(1, n)$.
<i>ldx</i>	INTEGER. The leading dimension of <i>x</i> ; $ldx \geq \max(1, n)$.
<i>ipiv</i>	<p>INTEGER.</p> <p>Array, size at least $\max(1, n)$. The <i>ipiv</i> array, as returned by ?spturf.</p>
<i>iwork</i>	INTEGER. Workspace array, size at least $\max(1, n)$.
<i>rwork</i>	<p>REAL for <i>csprfs</i></p> <p>DOUBLE PRECISION for <i>zsprfs</i>.</p> <p>Workspace array, size at least $\max(1, n)$.</p>

Output Parameters

<i>x</i>	The refined solution matrix <i>X</i> .
----------	--

<i>ferr, berr</i>	REAL for single precision flavors. DOUBLE PRECISION for double precision flavors. Arrays, size at least $\max(1, nrhs)$. Contain the component-wise forward and backward errors, respectively, for each solution vector.
<i>info</i>	INTEGER. If <i>info</i> = 0, the execution is successful. If <i>info</i> = - <i>i</i> , the <i>i</i> -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine *sprfs* interface are as follows:

<i>ap</i>	Holds the array <i>A</i> of size $(n * (n+1) / 2)$.
<i>afp</i>	Holds the array <i>AF</i> of size $(n * (n+1) / 2)$.
<i>ipiv</i>	Holds the vector of length <i>n</i> .
<i>b</i>	Holds the matrix <i>B</i> of size $(n, nrhs)$.
<i>x</i>	Holds the matrix <i>X</i> of size $(n, nrhs)$.
<i>ferr</i>	Holds the vector of length $(nrhs)$.
<i>berr</i>	Holds the vector of length $(nrhs)$.
<i>uplo</i>	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The bounds returned in *ferr* are not rigorous, but in practice they almost always overestimate the actual error.

For each right-hand side, computation of the backward error involves a minimum of $4n^2$ floating-point operations (for real flavors) or $16n^2$ operations (for complex flavors). In addition, each step of iterative refinement involves $6n^2$ operations (for real flavors) or $24n^2$ operations (for complex flavors); the number of iterations may range from 1 to 5.

Estimating the forward error involves solving a number of systems of linear equations $A * x = b$; the number of systems is usually 4 or 5 and never more than 11. Each solution requires approximately $2n^2$ floating-point operations for real flavors or $8n^2$ for complex flavors.

Description

The routine estimates the errors in the solution to a system of linear equations $A * X = B$ or $A^T * X = B$ or $A^H * X = B$ with a triangular matrix A , with multiple right-hand sides. For each computed solution vector x , the routine computes the *component-wise backward error* β . This error is the smallest relative perturbation in elements of A and b such that x is the exact solution of the perturbed system:

$$|\delta a_{ij}| \leq \beta |a_{ij}|, \quad |\delta b_i| \leq \beta |b_i| \text{ such that } (A + \delta A) x = (b + \delta b).$$

The routine also estimates the *component-wise forward error* in the computed solution $\|x - x_e\|_\infty / \|x\|_\infty$ (here x_e is the exact solution).

Before calling this routine, call the solver routine [?trtrs](#).

Input Parameters

<i>uplo</i>	CHARACTER*1. Must be 'U' or 'L'. Indicates whether A is upper or lower triangular: If <i>uplo</i> = 'U', then A is upper triangular. If <i>uplo</i> = 'L', then A is lower triangular.
<i>trans</i>	CHARACTER*1. Must be 'N' or 'T' or 'C'. Indicates the form of the equations: If <i>trans</i> = 'N', the system has the form $A * X = B$. If <i>trans</i> = 'T', the system has the form $A^T * X = B$. If <i>trans</i> = 'C', the system has the form $A^H * X = B$.
<i>diag</i>	CHARACTER*1. Must be 'N' or 'U'.

If *diag* = 'N', then *A* is not a unit triangular matrix.

If *diag* = 'U', then *A* is unit triangular: diagonal elements of *A* are assumed to be 1 and not referenced in the array *a*.

n

INTEGER. The order of the matrix *A*; $n \geq 0$.

nrhs

INTEGER. The number of right-hand sides; $nrhs \geq 0$.

a, *b*, *x*, *work*

REAL for *strrfs*

DOUBLE PRECISION for *dtrrfs*

COMPLEX for *ctrfs*

DOUBLE COMPLEX for *ztrrfs*.

Arrays:

a(size *lda* by *) contains the upper or lower triangular matrix *A*, as specified by *uplo*.

b(size *ldb* by *) contains the right-hand side matrix *B*.

x(size *ldx* by *) contains the solution matrix *X*.

work(*) is a workspace array.

The second dimension of *a* must be at least $\max(1, n)$; the second dimension of *b* and *x* must be at least $\max(1, nrhs)$; the dimension of *work* must be at least $\max(1, 3*n)$ for real flavors and $\max(1, 2*n)$ for complex flavors.

lda

INTEGER. The leading dimension of *a*; $lda \geq \max(1, n)$.

ldb

INTEGER. The leading dimension of *b*; $ldb \geq \max(1, n)$.

ldx

INTEGER. The leading dimension of *x*; $ldx \geq \max(1, n)$.

iwork

INTEGER. Workspace array, size at least $\max(1, n)$.

rwork

REAL for *ctrfs*

DOUBLE PRECISION for *ztrfs*.

Workspace array, size at least $\max(1, n)$.

Output Parameters

ferr, *berr*

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Arrays, size at least $\max(1, nrhs)$. Contain the component-wise forward and backward errors, respectively, for each solution vector.

info

INTEGER. If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `trrfs` interface are as follows:

<code>a</code>	Holds the matrix A of size (n, n) .
<code>b</code>	Holds the matrix B of size $(n, nrhs)$.
<code>x</code>	Holds the matrix X of size $(n, nrhs)$.
<code>ferr</code>	Holds the vector of length $(nrhs)$.
<code>berr</code>	Holds the vector of length $(nrhs)$.
<code>uplo</code>	Must be 'U' or 'L'. The default value is 'U'.
<code>trans</code>	Must be 'N', 'C', or 'T'. The default value is 'N'.
<code>diag</code>	Must be 'N' or 'U'. The default value is 'N'.

Application Notes

The bounds returned in `ferr` are not rigorous, but in practice they almost always overestimate the actual error.

A call to this routine involves, for each right-hand side, solving a number of systems of linear equations $A^*x = b$; the number of systems is usually 4 or 5 and never more than 11. Each solution requires approximately n^2 floating-point operations for real flavors or $4n^2$ for complex flavors.

Description

The routine estimates the errors in the solution to a system of linear equations $A^*X = B$ or $A^T * X = B$ or $A^H * X = B$ with a packed triangular matrix A , with multiple right-hand sides. For each computed solution vector x , the routine computes the *component-wise backward error* β . This error is the smallest relative perturbation in elements of A and b such that x is the exact solution of the perturbed system:

$$|\delta a_{ij}| \leq \beta |a_{ij}|, \quad |\delta b_i| \leq \beta |b_i| \text{ such that } (A + \delta A)x = (b + \delta b).$$

The routine also estimates the *component-wise forward error* in the computed solution $\|x - x_e\|_\infty / \|x\|_\infty$ (here x_e is the exact solution).

Before calling this routine, call the solver routine [?tprfs](#).

Input Parameters

<i>uplo</i>	<p>CHARACTER*1. Must be 'U' or 'L'.</p> <p>Indicates whether A is upper or lower triangular:</p> <p>If <i>uplo</i> = 'U', then A is upper triangular.</p> <p>If <i>uplo</i> = 'L', then A is lower triangular.</p>
<i>trans</i>	<p>CHARACTER*1. Must be 'N' or 'T' or 'C'.</p> <p>Indicates the form of the equations:</p> <p>If <i>trans</i> = 'N', the system has the form $A^*X = B$.</p> <p>If <i>trans</i> = 'T', the system has the form $A^T * X = B$.</p> <p>If <i>trans</i> = 'C', the system has the form $A^H * X = B$.</p>
<i>diag</i>	<p>CHARACTER*1. Must be 'N' or 'U'.</p> <p>If <i>diag</i> = 'N', A is not a unit triangular matrix.</p> <p>If <i>diag</i> = 'U', A is unit triangular: diagonal elements of A are assumed to be 1 and not referenced in the array <i>ap</i>.</p>
<i>n</i>	<p>INTEGER. The order of the matrix A; $n \geq 0$.</p>
<i>nrhs</i>	<p>INTEGER. The number of right-hand sides; $nrhs \geq 0$.</p>
<i>ap, b, x, work</i>	<p>REAL for <i>stprfs</i></p> <p>DOUBLE PRECISION for <i>dtprfs</i></p> <p>COMPLEX for <i>ctprfs</i></p> <p>DOUBLE COMPLEX for <i>ztpfrfs</i>.</p> <p>Arrays:</p> <p><i>ap</i> (size *) contains the upper or lower triangular matrix A, as specified by <i>uplo</i>.</p> <p><i>b</i>(size <i>ldb</i> by *) contains the right-hand side matrix B.</p> <p><i>x</i>(size <i>ldx</i> by *) contains the solution matrix X.</p> <p><i>work</i>(*) is a workspace array.</p>

The dimension of *ap* must be at least $\max(1, n(n+1)/2)$; the second dimension of *b* and *x* must be at least $\max(1, nrhs)$; the dimension of *work* must be at least $\max(1, 3*n)$ for real flavors and $\max(1, 2*n)$ for complex flavors.

<i>ldb</i>	INTEGER. The leading dimension of <i>b</i> ; $ldb \geq \max(1, n)$.
<i>ldx</i>	INTEGER. The leading dimension of <i>x</i> ; $ldx \geq \max(1, n)$.
<i>iwork</i>	INTEGER. Workspace array, size at least $\max(1, n)$.
<i>rwork</i>	REAL for <i>ctprfs</i> DOUBLE PRECISION for <i>ztpfrfs</i> . Workspace array, size at least $\max(1, n)$.

Output Parameters

<i>ferr</i> , <i>berr</i>	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Arrays, size at least $\max(1, nrhs)$. Contain the component-wise forward and backward errors, respectively, for each solution vector.
<i>info</i>	INTEGER. If <i>info</i> = 0, the execution is successful. If <i>info</i> = - <i>i</i> , the <i>i</i> -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine *tpfrfs* interface are as follows:

<i>ap</i>	Holds the array <i>A</i> of size $(n*(n+1)/2)$.
<i>b</i>	Holds the matrix <i>B</i> of size $(n, nrhs)$.
<i>x</i>	Holds the matrix <i>X</i> of size $(n, nrhs)$.
<i>ferr</i>	Holds the vector of length $(nrhs)$.
<i>berr</i>	Holds the vector of length $(nrhs)$.
<i>uplo</i>	Must be 'U' or 'L'. The default value is 'U'.
<i>trans</i>	Must be 'N', 'C', or 'T'. The default value is 'N'.
<i>diag</i>	Must be 'N' or 'U'. The default value is 'N'.

Application Notes

The bounds returned in *ferr* are not rigorous, but in practice they almost always overestimate the actual error.

A call to this routine involves, for each right-hand side, solving a number of systems of linear equations $A^*x = b$; the number of systems is usually 4 or 5 and never more than 11. Each solution requires approximately n^2 floating-point operations for real flavors or $4n^2$ for complex flavors.

work, rwork, info )
```

```
call ztbrfs( uplo, trans, diag, n, kd, nrhs, ab, ldab, b, ldb, x, ldx, ferr, berr,
work, rwork, info )
```

```
call tbrfs( ab, b, x [,uplo] [,trans] [,diag] [,ferr] [,berr] [,info] )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine estimates the errors in the solution to a system of linear equations $A^*X = B$ or $A^T*X = B$ or $A^H*X = B$ with a triangular band matrix A , with multiple right-hand sides. For each computed solution vector x , the routine computes the *component-wise backward error* β . This error is the smallest relative perturbation in elements of A and b such that x is the exact solution of the perturbed system:

$$|\delta a_{ij}| \leq \beta |a_{ij}|, \quad |\delta b_i| \leq \beta |b_i| \text{ such that } (A + \delta A)x = (b + \delta b).$$

The routine also estimates the *component-wise forward error* in the computed solution $\|x - x_e\|_\infty / \|x\|_\infty$ (here x_e is the exact solution).

Before calling this routine, call the solver routine [?tbtrs](#).

Input Parameters

<i>uplo</i>	CHARACTER*1. Must be 'U' or 'L'. Indicates whether A is upper or lower triangular: If <i>uplo</i> = 'U', then A is upper triangular. If <i>uplo</i> = 'L', then A is lower triangular.
<i>trans</i>	CHARACTER*1. Must be 'N' or 'T' or 'C'. Indicates the form of the equations: If <i>trans</i> = 'N', the system has the form $A^*X = B$. If <i>trans</i> = 'T', the system has the form $A^T*X = B$.

If $trans = 'C'$, the system has the form $A^H X = B$.

diag

CHARACTER*1. Must be 'N' or 'U'.

If $diag = 'N'$, A is not a unit triangular matrix.

If $diag = 'U'$, A is unit triangular: diagonal elements of A are assumed to be 1 and not referenced in the array ab .

n

INTEGER. The order of the matrix A ; $n \geq 0$.

kd

INTEGER. The number of super-diagonals or sub-diagonals in the matrix A ; $kd \geq 0$.

nrhs

INTEGER. The number of right-hand sides; $nrhs \geq 0$.

ab, b, x, work

REAL for `stbrfs`

DOUBLE PRECISION for `dtbrfs`

COMPLEX for `ctbrfs`

DOUBLE COMPLEX for `ztbrfs`.

Arrays:

ab (size $ldab$ by $*$) contains the upper or lower triangular matrix A , as specified by $uplo$, in band storage format.

b (size ldb by $*$) contains the right-hand side matrix B .

x (size ldx by $*$) contains the solution matrix X .

$work(*)$ is a workspace array.

The second dimension of a must be at least $\max(1, n)$; the second dimension of b and x must be at least $\max(1, nrhs)$. The dimension of $work$ must be at least $\max(1, 3*n)$ for real flavors and $\max(1, 2*n)$ for complex flavors.

ldab

INTEGER. The leading dimension of the array ab ; $ldab \geq kd + 1$.

ldb

INTEGER. The leading dimension of b ; $ldb \geq \max(1, n)$.

ldx

INTEGER. The leading dimension of x ; $ldx \geq \max(1, n)$.

iwork

INTEGER. Workspace array, size at least $\max(1, n)$.

rwork

REAL for `ctbrfs`

DOUBLE PRECISION for `ztbrfs`.

Workspace array, size at least $\max(1, n)$.

Output Parameters

ferr, berr

REAL for single precision flavors.

DOUBLE PRECISION for double precision flavors.

Arrays, size at least $\max(1, nrhs)$. Contain the component-wise forward and backward errors, respectively, for each solution vector.

info INTEGER. If *info* = 0, the execution is successful.
 If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `tbrfs` interface are as follows:

<i>ab</i>	Holds the array <i>A</i> of size $(kd+1, n)$.
<i>b</i>	Holds the matrix <i>B</i> of size $(n, nrhs)$.
<i>x</i>	Holds the matrix <i>X</i> of size $(n, nrhs)$.
<i>ferr</i>	Holds the vector of length $(nrhs)$.
<i>berr</i>	Holds the vector of length $(nrhs)$.
<i>uplo</i>	Must be 'U' or 'L'. The default value is 'U'.
<i>trans</i>	Must be 'N', 'C', or 'T'. The default value is 'N'.
<i>diag</i>	Must be 'N' or 'U'. The default value is 'N'.

Application Notes

The bounds returned in *ferr* are not rigorous, but in practice they almost always overestimate the actual error.

A call to this routine involves, for each right-hand side, solving a number of systems of linear equations $A^*x = b$; the number of systems is usually 4 or 5 and never more than 11. Each solution requires approximately $2n*kd$ floating-point operations for real flavors or $8n*kd$ operations for complex flavors.

Routines for Matrix Inversion

It is seldom necessary to compute an explicit inverse of a matrix. In particular, do not attempt to solve a system of equations $Ax = b$ by first computing A^{-1} and then forming the matrix-vector product $x = A^{-1}b$. Call a solver routine instead (see [Routines for Solving Systems of Linear Equations](#)); this is more efficient and more accurate.

However, matrix inversion routines are provided for the rare occasions when an explicit inverse matrix is needed.

?getri

Computes the inverse of an LU-factored general matrix.

Syntax

```
call sgetri( n, a, lda, ipiv, work, lwork, info )
call dgetri( n, a, lda, ipiv, work, lwork, info )
call cgetri( n, a, lda, ipiv, work, lwork, info )
```

```
call zgetri( n, a, lda, ipiv, work, lwork, info )
```

```
call getri( a, ipiv [,info] )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes the inverse $\text{inv}(A)$ of a general matrix A . Before calling this routine, call [?getrf](#) to factorize A .

Input Parameters

<i>n</i>	INTEGER. The order of the matrix A ; $n \geq 0$.
<i>a, work</i>	<p>REAL for sgetri</p> <p>DOUBLE PRECISION for dgetri</p> <p>COMPLEX for cgetri</p> <p>DOUBLE COMPLEX for zgetri.</p> <p>Arrays: $a(lda, *)$, $work(*)$.</p> <p>$a(lda, *)$ contains the factorization of the matrix A, as returned by ?getrf: $A = P * L * U$.</p> <p>The second dimension of a must be at least $\max(1, n)$.</p> <p>$work(*)$ is a workspace array of dimension at least $\max(1, lwork)$.</p>
<i>lda</i>	INTEGER. The leading dimension of a ; $lda \geq \max(1, n)$.
<i>ipiv</i>	<p>INTEGER.</p> <p>Array, size at least $\max(1, n)$.</p> <p>The <i>ipiv</i> array, as returned by ?getrf.</p>
<i>lwork</i>	<p>INTEGER. The size of the <i>work</i> array; $lwork \geq n$.</p> <p>If $lwork = -1$, then a workspace query is assumed; the routine only calculates the optimal size of the <i>work</i> array, returns this value as the first entry of the <i>work</i> array, and no error message related to <i>lwork</i> is issued by xerbla.</p>

See *Application Notes* below for the suggested value of *lwork*.

Output Parameters

<i>a</i>	Overwritten by the n -by- n matrix $\text{inv}(A)$.
<i>work(1)</i>	If $info = 0$, on exit <i>work(1)</i> contains the minimum value of <i>lwork</i> required for optimum performance. Use this <i>lwork</i> for subsequent runs.
<i>info</i>	<p>INTEGER. If $info = 0$, the execution is successful.</p> <p>If $info = -i$, the i-th parameter had an illegal value.</p>

If $info = i$, the i -th diagonal element of the factor U is zero, U is singular, and the inversion could not be completed.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `getri` interface are as follows:

<code>a</code>	Holds the matrix A of size (n, n) .
<code>ipiv</code>	Holds the vector of length n .

Application Notes

For better performance, try using $lwork = n * blocksize$, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set $lwork = -1$.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value ($work(1)$) for subsequent runs.

If you set $lwork = -1$, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed inverse X satisfies the following error bound:

$$\|XA - I\| \leq c(n)\varepsilon\|X\|P\|L\|U\|,$$

where $c(n)$ is a modest linear function of n ; ε is the machine precision; I denotes the identity matrix; P , L , and U are the factors of the matrix factorization $A = P^*L^*U$.

The total number of floating-point operations is approximately $(4/3)n^3$ for real flavors and $(16/3)n^3$ for complex flavors.

[Matrix Storage Schemes](#)

?potri

Computes the inverse of a symmetric (Hermitian) positive-definite matrix using the Cholesky factorization.

Syntax

```
call spotri( uplo, n, a, lda, info )
call dpotri( uplo, n, a, lda, info )
call cpotri( uplo, n, a, lda, info )
call zpotri( uplo, n, a, lda, info )
call potri( a [,uplo] [,info] )
```

Include Files

- `mkl.fi`, `lapack.f90`

Description

The routine computes the inverse $\text{inv}(A)$ of a symmetric positive definite or, for complex flavors, Hermitian positive-definite matrix A . Before calling this routine, call [?potrf](#) to factorize A .

Input Parameters

<i>uplo</i>	<p>CHARACTER*1. Must be 'U' or 'L'.</p> <p>Indicates how the input matrix A has been factored:</p> <p>If <i>uplo</i> = 'U', the upper triangle of A is stored.</p> <p>If <i>uplo</i> = 'L', the lower triangle of A is stored.</p>
<i>n</i>	<p>INTEGER. The order of the matrix A; $n \geq 0$.</p>
<i>a</i>	<p>REAL for <code>spotri</code></p> <p>DOUBLE PRECISION for <code>dpotri</code></p> <p>COMPLEX for <code>cpotri</code></p> <p>DOUBLE COMPLEX for <code>zpotri</code>.</p> <p>Array <i>a</i>(size <i>lda</i> by *). Contains the factorization of the matrix A, as returned by ?potrf.</p> <p>The second dimension of <i>a</i> must be at least $\max(1, n)$.</p>
<i>lda</i>	<p>INTEGER. The leading dimension of <i>a</i>; $lda \geq \max(1, n)$.</p>

Output Parameters

<i>a</i>	Overwritten by the upper or lower triangle of the inverse of A .
<i>info</i>	<p>INTEGER.</p> <p>If <i>info</i> = 0, the execution is successful.</p> <p>If <i>info</i> = -<i>i</i>, the <i>i</i>-th parameter had an illegal value.</p> <p>If <i>info</i> = <i>i</i>, the <i>i</i>-th diagonal element of the Cholesky factor (and therefore the factor itself) is zero, and the inversion could not be completed.</p>

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `potri` interface are as follows:

<i>a</i>	Holds the matrix A of size (n, n) .
<i>uplo</i>	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The computed inverse X satisfies the following error bounds:

$$\|XA - I\|_2 \leq c(n) \varepsilon \kappa_2(A), \quad \|AX - I\|_2 \leq c(n) \varepsilon \kappa_2(A),$$

where $c(n)$ is a modest linear function of n , and ε is the machine precision; I denotes the identity matrix.

The 2-norm $\|A\|_2$ of a matrix A is defined by $\|A\|_2 = \max_{x \cdot x=1} (Ax \cdot Ax)^{1/2}$, and the condition number $\kappa_2(A)$ is defined by $\kappa_2(A) = \|A\|_2 \|A^{-1}\|_2$.

The total number of floating-point operations is approximately $(2/3)n^3$ for real flavors and $(8/3)n^3$ for complex flavors.

?pftri

Computes the inverse of a symmetric (Hermitian) positive-definite matrix in RFP format using the Cholesky factorization.

Syntax

```
call spftri( transr, uplo, n, a, info )
call dpftri( transr, uplo, n, a, info )
call cpftri( transr, uplo, n, a, info )
call zpftri( transr, uplo, n, a, info )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes the inverse $\text{inv}(A)$ of a symmetric positive definite or, for complex data, Hermitian positive-definite matrix A using the Cholesky factorization:

$$\begin{aligned} A &= U^T * U \text{ for real data, } A = U^H * U \text{ for complex data} && \text{if } uplo = 'U' \\ A &= L * L^T \text{ for real data, } A = L * L^H \text{ for complex data} && \text{if } uplo = 'L' \end{aligned}$$

Before calling this routine, call [?pftfrf](#) to factorize A .

The matrix A is in the Rectangular Full Packed (RFP) format. For the description of the RFP format, see [Matrix Storage Schemes](#).

Input Parameters

transr

CHARACTER*1. Must be 'N', 'T' (for real data) or 'C' (for complex data).

If *transr* = 'N', the Normal *transr* of RFP U (if *uplo* = 'U') or L (if *uplo* = 'L') is stored.

If *transr* = 'T', the Transpose *transr* of RFP U (if *uplo* = 'U') or L (if *uplo* = 'L') is stored.

If *transr* = 'C', the Conjugate-Transpose *transr* of RFP U (if *uplo* = 'U') or L (if *uplo* = 'L') is stored.

<i>uplo</i>	<p>CHARACTER*1. Must be 'U' or 'L'.</p> <p>Indicates how the input matrix <i>A</i> has been factored:</p> <p>If <i>uplo</i> = 'U', $A = U^T * U$ for real data or $A = U^H * U$ for complex data, and <i>U</i> is stored.</p> <p>If <i>uplo</i> = 'L', $A = L * L^T$ for real data or $A = L * L^H$ for complex data, and <i>L</i> is stored.</p>
<i>n</i>	INTEGER. The order of the matrix <i>A</i> ; $n \geq 0$.
<i>a</i>	<p>REAL for <code>spptri</code></p> <p>DOUBLE PRECISION for <code>dpptri</code></p> <p>COMPLEX for <code>cpptri</code></p> <p>DOUBLE COMPLEX for <code>zpptri</code>.</p> <p>Array, size $(n * (n + 1) / 2)$. The array <i>a</i> contains the factor <i>U</i> or <i>L</i> matrix <i>A</i> in the RFP format.</p>

Output Parameters

<i>a</i>	The symmetric/Hermitian inverse of the original matrix in the same storage format.
<i>info</i>	<p>INTEGER. If <i>info</i>=0, the execution is successful.</p> <p>If <i>info</i> = -<i>i</i>, the <i>i</i>-th parameter had an illegal value.</p> <p>If <i>info</i> = <i>i</i>, the (<i>i</i>,<i>i</i>) element of the factor <i>U</i> or <i>L</i> is zero, and the inverse could not be computed.</p>

- `mkl.fi`, `lapack.f90`

Description

The routine computes the inverse $\text{inv}(A)$ of a complex Hermitian matrix A . Before calling this routine, call [?hetrf](#) to factorize A .

Input Parameters

<code>uplo</code>	CHARACTER*1. Must be 'U' or 'L'. Indicates how the input matrix A has been factored: If <code>uplo = 'U'</code> , the array <code>a</code> stores the Bunch-Kaufman factorization $A = U^*D*U^H$. If <code>uplo = 'L'</code> , the array <code>a</code> stores the Bunch-Kaufman factorization $A = L^*D*L^H$.
<code>n</code>	INTEGER. The order of the matrix A ; $n \geq 0$.

a, *work* COMPLEX for `chetri`
DOUBLE COMPLEX for `zhetri`.

Arrays:

a(*lda*,*) contains the factorization of the matrix *A*, as returned by ?
[hetrf](#).

The second dimension of *a* must be at least $\max(1, n)$.

work(*) is a workspace array.

The dimension of *work* must be at least $\max(1, n)$.

lda INTEGER. The leading dimension of *a*; $lda \geq \max(1, n)$.

ipiv INTEGER.

Array, size at least $\max(1, n)$. The *ipiv* array, as returned by ?
[hetrf](#).

Output Parameters

a Overwritten by the *n*-by-*n* matrix $\text{inv}(A)$.

info INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, the *i*-th diagonal element of *D* is zero, *D* is singular, and the inversion could not be completed.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `hetri` interface are as follows:

a Holds the matrix *A* of size (*n*, *n*).

ipiv Holds the vector of length *n*.

uplo Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The computed inverse *X* satisfies the following error bounds:

$$|D^*U^H P^T X^* P^* U - I| \leq c(n) \varepsilon (|D| |U^H| P^T |X| P |U| + |D| |D^{-1}|)$$

for *uplo* = 'U', and

$$|D^* L^H P^T X^* P^* L - I| \leq c(n) \varepsilon (|D| |L^H| P^T |X| P |L| + |D| |D^{-1}|)$$

for *uplo* = 'L'. Here *c*(*n*) is a modest linear function of *n*, and ε is the machine precision; *I* denotes the identity matrix.

The total number of floating-point operations is approximately $(8/3)n^3$ for complex flavors.

The real counterpart of this routine is [?sytri](#).

Description

The routine computes the inverse $inv(A)$ of a Hermitian indefinite matrix A using the factorization $A = U*D*U^H$ or $A = L*D*L^H$ computed by `?hetrf`.

The `?hetri2` routine sets the leading dimension of the workspace before calling `?hetri2x` that actually computes the inverse.

Input Parameters

<code>uplo</code>	CHARACTER*1. Must be 'U' or 'L'. Indicates how the input matrix A has been factored: If <code>uplo = 'U'</code> , the array <code>a</code> stores the factorization $A = U*D*U^H$. If <code>uplo = 'L'</code> , the array <code>a</code> stores the factorization $A = L*D*L^H$.
<code>n</code>	INTEGER. The order of the matrix A ; $n \geq 0$.
<code>a, work</code>	COMPLEX for <code>chetri2</code>

DOUBLE COMPLEX for `zhetri2`

Array *a* (size *lda* by *) contains the block diagonal matrix *D* and the multipliers used to obtain the factor *U* or *L* as returned by `?sytrf`.

The second dimension of *a* must be at least $\max(1, n)$.

work is a workspace array of $(n+nb+1) * (nb+3)$ dimension.

lda

INTEGER. The leading dimension of *a*; $lda \geq \max(1, n)$.

ipiv

INTEGER.

Array, size at least $\max(1, n)$.

Details of the interchanges and the block structure of *D* as returned by `?hetrf`.

lwork

INTEGER. The dimension of the *work* array.

$lwork \geq (n+nb+1) * (nb+3)$

where

nb is the block size parameter as returned by `hetrf`.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by `xerbla`.

Output Parameters

a

If *info* = 0, the inverse of the original matrix.

If *uplo* = 'U', the upper triangular part of the inverse is formed and the part of *A* below the diagonal is not referenced.

If *uplo* = 'L', the lower triangular part of the inverse is formed and the part of *A* above the diagonal is not referenced.

info

INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, $D(i,i) = 0$; *D* is singular and its inversion could not be computed.

*Computes the inverse of a complex Hermitian matrix using $U*D*U^H$ or $L*D*L^H$ Bunch-Kaufman factorization of matrix in packed storage.*

Syntax

```
call chptri( uplo, n, ap, ipiv, work, info )
call zhptri( uplo, n, ap, ipiv, work, info )
call hptri( ap, ipiv [,uplo] [,info] )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes the inverse $\text{inv}(A)$ of a complex Hermitian matrix *A* using packed storage. Before calling this routine, call ?hptrf to factorize *A*.

Input Parameters

<i>uplo</i>	CHARACTER*1. Must be 'U' or 'L'. Indicates how the input matrix <i>A</i> has been factored: If <i>uplo</i> = 'U', the array <i>ap</i> stores the packed Bunch-Kaufman factorization $A = U*D*U^H$. If <i>uplo</i> = 'L', the array <i>ap</i> stores the packed Bunch-Kaufman factorization $A = L*D*L^H$.
<i>n</i>	INTEGER. The order of the matrix <i>A</i> ; $n \geq 0$.
<i>ap, work</i>	COMPLEX for chptri

DOUBLE COMPLEX for `zhptri`.

Arrays:

`ap(*)` contains the factorization of the matrix A , as returned by [?hptrf](#).

The dimension of `ap` must be at least $\max(1, n(n+1)/2)$.

`work(*)` is a workspace array.

The dimension of `work` must be at least $\max(1, n)$.

`ipiv`

INTEGER.

Array, size at least $\max(1, n)$.

The `ipiv` array, as returned by [?hptrf](#).

Output Parameters

`ap`

Overwritten by the matrix $\text{inv}(A)$.

`info`

INTEGER.

If `info` = 0, the execution is successful.

If `info` = $-i$, the i -th parameter had an illegal value.

If `info` = i , the i -th diagonal element of D is zero, D is singular, and the inversion could not be completed.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `hptri` interface are as follows:

`ap`

Holds the array A of size $(n*(n+1)/2)$.

`ipiv`

Holds the vector of length n .

`uplo`

Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The computed inverse X satisfies the following error bounds:

$$\|D^*U^H P^T X^* P^* U - I\| \leq c(n) \epsilon (\|D\| \|U^H\| P^T \|X\| P \|U\| + \|D\| \|D^{-1}\|)$$

for `uplo` = 'U', and

$$\|D^*L^H P^T X^* P^* L - I\| \leq c(n) \epsilon (\|D\| \|L^H\| P^T \|X\| P \|L\| + \|D\| \|D^{-1}\|)$$

for `uplo` = 'L'. Here $c(n)$ is a modest linear function of n , and ϵ is the machine precision; I denotes the identity matrix.

The total number of floating-point operations is approximately $(8/3)n^3$.

The real counterpart of this routine is [?sptri](#).

The routine computes the inverse $\text{inv}(A)$ of a triangular matrix A .

Input Parameters

<i>uplo</i>	<p>CHARACTER*1. Must be 'U' or 'L'.</p> <p>Indicates whether A is upper or lower triangular:</p> <p>If <i>uplo</i> = 'U', then A is upper triangular.</p> <p>If <i>uplo</i> = 'L', then A is lower triangular.</p>
<i>diag</i>	<p>CHARACTER*1. Must be 'N' or 'U'.</p> <p>If <i>diag</i> = 'N', then A is not a unit triangular matrix.</p> <p>If <i>diag</i> = 'U', A is unit triangular: diagonal elements of A are assumed to be 1 and not referenced in the array a.</p>
<i>n</i>	<p>INTEGER. The order of the matrix A; $n \geq 0$.</p>
<i>a</i>	<p>REAL for strtri</p> <p>DOUBLE PRECISION for dtrtri</p> <p>COMPLEX for ctrtri</p> <p>DOUBLE COMPLEX for ztrtri.</p> <p>Array: size <i>lda</i> by *size $\max(1, \text{lda} * n)$. Contains the matrix A. The second dimension of a must be at least $\max(1, n)$.</p>
<i>lda</i>	<p>INTEGER. The first dimension of a; $\text{lda} \geq \max(1, n)$.</p>

Output Parameters

<i>a</i>	Overwritten by the matrix $\text{inv}(A)$.
<i>info</i>	<p>INTEGER.</p> <p>If <i>info</i> = 0, the execution is successful.</p> <p>If <i>info</i> = -<i>i</i>, the <i>i</i>-th parameter had an illegal value.</p>

If $info = i$, the i -th diagonal element of A is zero, A is singular, and the inversion could not be completed.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `trtri` interface are as follows:

<code>a</code>	Holds the matrix A of size (n, n) .
<code>uplo</code>	Must be 'U' or 'L'. The default value is 'U'.
<code>diag</code>	Must be 'N' or 'U'. The default value is 'N'.

Application Notes

The computed inverse X satisfies the following error bounds:

$$\|XA - I\| \leq c(n)\varepsilon \|X\| \|A\|$$

$$\|XA - I\| \leq c(n)\varepsilon \|A^{-1}\| \|A\| \|X\|,$$

where $c(n)$ is a modest linear function of n ; ε is the machine precision; I denotes the identity matrix.

The total number of floating-point operations is approximately $(1/3)n^3$ for real flavors and $(4/3)n^3$ for complex flavors.

[Matrix Storage Schemes](#)

?trtri

Computes the inverse of a triangular matrix stored in the Rectangular Full Packed (RFP) format.

Syntax

```
call stftri( transr, uplo, diag, n, a, info )
call dtftri( transr, uplo, diag, n, a, info )
call ctftri( transr, uplo, diag, n, a, info )
call ztftri( transr, uplo, diag, n, a, info )
```

Include Files

- `mk1.fi`, `lapack.f90`

Description

Computes the inverse of a triangular matrix A stored in the Rectangular Full Packed (RFP) format. For the description of the RFP format, see [Matrix Storage Schemes](#).

This is the block version of the algorithm, calling Level 3 BLAS.

Input Parameters

<code>transr</code>	CHARACTER*1. Must be 'N', 'T' (for real data) or 'C' (for complex data).
---------------------	--

If *transr* = 'N', the Normal *transr* of RFP *A* is stored.
 If *transr* = 'T', the Transpose *transr* of RFP *A* is stored.
 If *transr* = 'C', the Conjugate-Transpose *transr* of RFP *A* is stored.

uplo

CHARACTER*1. Must be 'U' or 'L'.

Indicates whether the upper or lower triangular part of RFP *A* is stored:

If *uplo* = 'U', the array *a* stores the upper triangular part of the matrix *A*.

If *uplo* = 'L', the array *a* stores the lower triangular part of the matrix *A*.

diag

CHARACTER*1. Must be 'N' or 'U'.

If *diag* = 'N', then *A* is not a unit triangular matrix.

If *diag* = 'U', *A* is unit triangular: diagonal elements of *A* are assumed to be 1 and not referenced in the array *a*.

n

INTEGER. The order of the matrix *A*; $n \geq 0$.

a

REAL for stftri

DOUBLE PRECISION for dtftri

COMPLEX for ctftri

DOUBLE COMPLEX for ztftri.

Array, size $\max(1, n*(n+1)/2)$. The array *a* contains the matrix *A* in the RFP format.

Output Parameters

a

The (triangular) inverse of the original matrix in the same storage format.

info

INTEGER. If *info*=0, the execution is successful.

If *info* = $-i$, the *i*-th parameter had an illegal value.

If *info* = *i*, $A(i,i)$ is exactly zero. The triangular matrix is singular and its inverse cannot be computed.

Routines for Matrix Equilibration

Routines described in this section are used to compute scaling factors needed to equilibrate a matrix. Note that these routines do not actually scale the matrices.

?geequ

Computes row and column scaling factors intended to equilibrate a general matrix and reduce its condition number.

Syntax

```
call sgeequ( m, n, a, lda, r, c, rowcnd, colcnd, amax, info )
call dgeequ( m, n, a, lda, r, c, rowcnd, colcnd, amax, info )
call cgeequ( m, n, a, lda, r, c, rowcnd, colcnd, amax, info )
call zgeequ( m, n, a, lda, r, c, rowcnd, colcnd, amax, info )
call geequ( a, r, c [,rowcnd] [,colcnd] [,amax] [,info] )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes row and column scalings intended to equilibrate an m -by- n matrix A and reduce its condition number. The output array r returns the row scale factors and the array c the column scale factors. These factors are chosen to try to make the largest element in each row and column of the matrix B with elements $b_{ij}=r(i)*a_{ij}*c(j)$ have absolute value 1.

See [?laqge](#) auxiliary function that uses scaling factors computed by [?geequ](#).

Input Parameters

m INTEGER. The number of rows of the matrix A ; $m \geq 0$.

n INTEGER. The number of columns of the matrix *A*; $n \geq 0$.

a REAL for sgeequ
 DOUBLE PRECISION for dgeequ
 COMPLEX for cgeequ
 DOUBLE COMPLEX for zgeequ.
 Array: size *lda* by *.
 Contains the *m*-by-*n* matrix *A* whose equilibration factors are to be computed.
 The second dimension of *a* must be at least $\max(1, n)$.

lda INTEGER. The leading dimension of *a*; $lda \geq \max(1, m)$.

Output Parameters

r, c REAL for single precision flavors
 DOUBLE PRECISION for double precision flavors.
 Arrays: *r* (size *m*), *c* (size *n*).
 If *info* = 0, or *info* > *m*, the array *r* contains the row scale factors of the matrix *A*.
 If *info* = 0, the array *c* contains the column scale factors of the matrix *A*.

rowcnd REAL for single precision flavors
 DOUBLE PRECISION for double precision flavors.
 If *info* = 0 or *info* > *m*, *rowcnd* contains the ratio of the smallest *r*(*i*) to the largest *r*(*i*).

colcnd REAL for single precision flavors
 DOUBLE PRECISION for double precision flavors.
 If *info* = 0, *colcnd* contains the ratio of the smallest *c*(*i*) to the largest *c*(*i*).

amax REAL for single precision flavors
 DOUBLE PRECISION for double precision flavors.
 Absolute value of the largest element of the matrix *A*.

info INTEGER.
 If *info* = 0, the execution is successful.
 If *info* = -*i*, the *i*-th parameter had an illegal value.
 If *info* = *i*, *i* > 0, and
 i ≤ *m*, the *i*-th row of *A* is exactly zero;
 i > *m*, the (*i*-*m*)th column of *A* is exactly zero.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `sgeequ` interface are as follows:

a	Holds the matrix A of size (m, n) .
r	Holds the vector of length (m) .
c	Holds the vector of length n .

Application Notes

All the components of r and c are restricted to be between `SMLNUM` = smallest safe number and `BIGNUM` = largest safe number. Use of these scaling factors is not guaranteed to reduce the condition number of A but works well in practice.

`SMLNUM` and `BIGNUM` are parameters representing machine precision. You can use the `?lamch` routines to compute them. For example, compute single precision values of `SMLNUM` and `BIGNUM` as follows:

```
SMLNUM = slamch ('s')
BIGNUM = 1 / SMLNUM
```

If $rowcnd \geq 0.1$ and $amax$ is neither too large nor too small, it is not worth scaling by r .

If $colcnd \geq 0.1$, it is not worth scaling by c .

If $amax$ is very close to `SMLNUM` or very close to `BIGNUM`, the matrix A should be scaled.

[Error Analysis](#)

[Matrix Storage Schemes](#)

?geequb

Computes row and column scaling factors restricted to a power of radix to equilibrate a general matrix and reduce its condition number.

Syntax

```
call sgeequb( m, n, a, lda, r, c, rowcnd, colcnd, amax, info )
call dgeequb( m, n, a, lda, r, c, rowcnd, colcnd, amax, info )
call cgeequb( m, n, a, lda, r, c, rowcnd, colcnd, amax, info )
call zgeequb( m, n, a, lda, r, c, rowcnd, colcnd, amax, info )
```

Include Files

- `mkl.fi`, `lapack.f90`

Description

The routine computes row and column scalings intended to equilibrate an m -by- n general matrix A and reduce its condition number. The output array r returns the row scale factors and the array c - the column scale factors. These factors are chosen to try to make the largest element in each row and column of the matrix B with elements $b_{i,j} = r(i) * a_{i,j} * c(j)$ have an absolute value of at most the radix.

$r(i)$ and $c(j)$ are restricted to be a power of the radix between $SMLNUM$ = smallest safe number and $BIGNUM$ = largest safe number. Use of these scaling factors is not guaranteed to reduce the condition number of a but works well in practice.

$SMLNUM$ and $BIGNUM$ are parameters representing machine precision. You can use the [?lamch](#) routines to compute them. For example, compute single precision values of $SMLNUM$ and $BIGNUM$ as follows:

```
SMLNUM = slamch ('s')
BIGNUM = 1 / SMLNUM
```

This routine differs from [?geequ](#) by restricting the scaling factors to a power of the radix. Except for over- and underflow, scaling by these factors introduces no additional rounding errors. However, the scaled entries' magnitudes are no longer equal to approximately 1 but lie between $\sqrt{\text{radix}}$ and $1/\sqrt{\text{radix}}$.

Input Parameters

m	INTEGER. The number of rows of the matrix A ; $m \geq 0$.
n	INTEGER. The number of columns of the matrix A ; $n \geq 0$.
a	REAL for <code>sgeequb</code> DOUBLE PRECISION for <code>dgeequb</code> COMPLEX for <code>cgeequb</code> DOUBLE COMPLEX for <code>zgeequb</code> . Array: size $(lda, *)$. Contains the m -by- n matrix A whose equilibration factors are to be computed. The second dimension of a must be at least $\max(1, n)$.
lda	INTEGER. The leading dimension of a ; $lda \geq \max(1, m)$.

Output Parameters

r, c	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Arrays: $r(m), c(n)$. If $info = 0$, or $info > m$, the array r contains the row scale factors for the matrix A . If $info = 0$, the array c contains the column scale factors for the matrix A .
$rowcnd$	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. If $info = 0$ or $info > m$, $rowcnd$ contains the ratio of the smallest $r(i)$ to the largest $r(i)$. If $rowcnd \geq 0.1$, and $amax$ is neither too large nor too small, it is not worth scaling by r .
$colcnd$	REAL for single precision flavors DOUBLE PRECISION for double precision flavors.

If $info = 0$, $colcnd$ contains the ratio of the smallest $c(i)$ to the largest $c(i)$. If $colcnd \geq 0.1$, it is not worth scaling by c .

amax

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Absolute value of the largest element of the matrix A . If *amax* is very close to SMLNUM or very close to BIGNUM, the matrix should be scaled.

info

INTEGER.

If $info = 0$, the execution is successful.

If $info = -i$, the i -th parameter had an illegal value.

If $info = i$, $i > 0$, and

$i \leq m$, the i -th row of A is exactly zero;

$i > m$, the $(i-m)$ -th column of A is exactly zero.

call gbequ( ab, r, c [,kl] [,rowcnd] [,colcnd] [,amax] [,info] )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes row and column scalings intended to equilibrate an m -by- n band matrix A and reduce its condition number. The output array r returns the row scale factors and the array c the column scale factors. These factors are chosen to try to make the largest element in each row and column of the matrix B with elements $b_{ij}=r(i)*a_{ij}*c(j)$ have absolute value 1.

See ?laqgb auxiliary function that uses scaling factors computed by ?gbequ.

Input Parameters

m

INTEGER. The number of rows of the matrix A ; $m \geq 0$.

n

INTEGER. The number of columns of the matrix A ; $n \geq 0$.

<i>kl</i>	INTEGER. The number of subdiagonals within the band of <i>A</i> ; $kl \geq 0$.
<i>ku</i>	INTEGER. The number of superdiagonals within the band of <i>A</i> ; $ku \geq 0$.
<i>ab</i>	REAL for sgbequ DOUBLE PRECISION for dgbequ COMPLEX for cgbequ DOUBLE COMPLEX for zgbequ. Array, size <i>ldab</i> by *. Contains the original band matrix <i>A</i> stored in rows from 1 to $kl + ku + 1$. The second dimension of <i>ab</i> must be at least $\max(1, n)$.
<i>ldab</i>	INTEGER. The leading dimension of <i>ab</i> ; $ldab \geq kl + ku + 1$.

Output Parameters

<i>r, c</i>	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Arrays: <i>r</i> (size <i>m</i>), <i>c</i> (size <i>n</i>). If <i>info</i> = 0, or <i>info</i> > <i>m</i> , the array <i>r</i> contains the row scale factors of the matrix <i>A</i> . If <i>info</i> = 0, the array <i>c</i> contains the column scale factors of the matrix <i>A</i> .
<i>rowcnd</i>	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. If <i>info</i> = 0 or <i>info</i> > <i>m</i> , <i>rowcnd</i> contains the ratio of the smallest <i>r</i> (<i>i</i>) to the largest <i>r</i> (<i>i</i>).
<i>colcnd</i>	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. If <i>info</i> = 0, <i>colcnd</i> contains the ratio of the smallest <i>c</i> (<i>i</i>) to the largest <i>c</i> (<i>i</i>).
<i>amax</i>	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Absolute value of the largest element of the matrix <i>A</i> .
<i>info</i>	INTEGER. If <i>info</i> = 0, the execution is successful. If <i>info</i> = - <i>i</i> , the <i>i</i> -th parameter had an illegal value. If <i>info</i> = <i>i</i> and $i \leq m$, the <i>i</i> -th row of <i>A</i> is exactly zero; $i > m$, the (<i>i</i> - <i>m</i>)th column of <i>A</i> is exactly zero.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `gbequ` interface are as follows:

<code>ab</code>	Holds the array A of size $(kl+ku+1, n)$.
<code>r</code>	Holds the vector of length (m) .
<code>c</code>	Holds the vector of length n .
<code>kl</code>	If omitted, assumed $kl = ku$.
<code>ku</code>	Restored as $ku = lda - kl - 1$.

Application Notes

All the components of r and c are restricted to be between $SMLNUM$ = smallest safe number and $BIGNUM$ = largest safe number. Use of these scaling factors is not guaranteed to reduce the condition number of A but works well in practice.

$SMLNUM$ and $BIGNUM$ are parameters representing machine precision. You can use the `?lamch` routines to compute them. For example, compute single precision values of $SMLNUM$ and $BIGNUM$ as follows:

```
SMLNUM = slamch ('s')
BIGNUM = 1 / SMLNUM
```

If $rowcnd \geq 0.1$ and $amax$ is neither too large nor too small, it is not worth scaling by r .

If $colcnd \geq 0.1$, it is not worth scaling by c .

If $amax$ is very close to $SMLNUM$ or very close to $BIGNUM$, the matrix A should be scaled.

Matrix Storage Schemes

?poequ

Computes row and column scaling factors intended to equilibrate a symmetric (Hermitian) positive definite matrix and reduce its condition number.

Syntax

```
call spoequ( n, a, lda, s, scond, amax, info )
call dpoequ( n, a, lda, s, scond, amax, info )
call cpoequ( n, a, lda, s, scond, amax, info )
call zpoequ( n, a, lda, s, scond, amax, info )
call poequ( a, s [,scond] [,amax] [,info] )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes row and column scalings intended to equilibrate a symmetric (Hermitian) positive-definite matrix A and reduce its condition number (with respect to the two-norm). The output array s returns scale factors such that $s(i) s[i + 1]$ contains

$$\frac{1}{\sqrt{a_{i,i}}}$$

These factors are chosen so that the scaled matrix B with elements $B_{i,j}=s(i)*A_{i,j}*s(j)$ has diagonal elements equal to 1.

This choice of s puts the condition number of B within a factor n of the smallest possible condition number over all possible diagonal scalings.

See [?laqsy](#) auxiliary function that uses scaling factors computed by [?poequ](#).

Input Parameters

<i>n</i>	INTEGER. The order of the matrix A ; $n \geq 0$.
<i>a</i>	<p>REAL for <code>spoequ</code></p> <p>DOUBLE PRECISION for <code>dpoequ</code></p> <p>COMPLEX for <code>cpoequ</code></p> <p>DOUBLE COMPLEX for <code>zpoequ</code>.</p> <p>Array: size <i>lda</i> by *.</p> <p>Contains the n-by-n symmetric or Hermitian positive definite matrix A whose scaling factors are to be computed. Only the diagonal elements of A are referenced.</p> <p>The second dimension of a must be at least $\max(1, n)$.</p>
<i>lda</i>	INTEGER. The leading dimension of a ; $lda \geq \max(1, n)$.

Output Parameters

<i>s</i>	<p>REAL for single precision flavors</p> <p>DOUBLE PRECISION for double precision flavors.</p> <p>Array, size n.</p> <p>If <i>info</i> = 0, the array s contains the scale factors for A.</p>
<i>scond</i>	<p>REAL for single precision flavors</p> <p>DOUBLE PRECISION for double precision flavors.</p> <p>If <i>info</i> = 0, <i>scond</i> contains the ratio of the smallest $s(i)$ to the largest $s(i)$.</p>
<i>amax</i>	<p>REAL for single precision flavors</p> <p>DOUBLE PRECISION for double precision flavors.</p> <p>Absolute value of the largest element of the matrix A.</p>
<i>info</i>	<p>INTEGER.</p> <p>If <i>info</i> = 0, the execution is successful.</p>

If $info = -i$, the i -th parameter had an illegal value.

If $info = i$, the i -th diagonal element of A is nonpositive.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `poequ` interface are as follows:

a Holds the matrix A of size (n, n) .

s Holds the vector of length n .

Application Notes

If $scond \geq 0.1$ and $amax$ is neither too large nor too small, it is not worth scaling by s .

If $amax$ is very close to `SMLNUM` or very close to `BIGNUM`, the matrix A should be scaled.

?poequb

Computes row and column scaling factors intended to equilibrate a symmetric (Hermitian) positive definite matrix and reduce its condition number.

Syntax

```
call spoequb( n, a, lda, s, scond, amax, info )
```

```
call dpoequb( n, a, lda, s, scond, amax, info )
```

```
call cpoequb( n, a, lda, s, scond, amax, info )
```

```
call zpoequb( n, a, lda, s, scond, amax, info )
```

Include Files

- `mk1.fi`, `lapack.f90`

Description

The routine computes row and column scalings intended to equilibrate a symmetric (Hermitian) positive-definite matrix A and reduce its condition number (with respect to the two-norm).

These factors are chosen so that the scaled matrix B with elements $B_{i,j} = s(i) * A_{i,j} * s(j)$ has diagonal elements equal to 1. $s(i)$ is a power of two nearest to, but not exceeding $1/\sqrt{A_{i,i}}$.

This choice of s puts the condition number of B within a factor n of the smallest possible condition number over all possible diagonal scalings.

Input Parameters

n INTEGER. The order of the matrix A ; $n \geq 0$.

a REAL for `spoequb`

DOUBLE PRECISION for dpoequb

COMPLEX for cpoequb

DOUBLE COMPLEX for zpoequb.

Array: size *lda* by *.

Contains the *n*-by-*n* symmetric or Hermitian positive definite matrix *A* whose scaling factors are to be computed. Only the diagonal elements of *A* are referenced.

The second dimension of *a* must be at least $\max(1, n)$.

lda

INTEGER. The leading dimension of *a*; $lda \geq \max(1, m)$.

Output Parameters

s

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, size (*n*).

If *info* = 0, the array *s* contains the scale factors for *A*.

scond

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

If *info* = 0, *scond* contains the ratio of the smallest *s*(*i*) to the largest *s*(*i*). If $scond \geq 0.1$, and *amax* is neither too large nor too small, it is not worth scaling by *s*.

amax

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Absolute value of the largest element of the matrix *A*. If *amax* is very close to SMLNUM or BIGNUM, the matrix should be scaled.

info

INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, the *i*-th diagonal element of *A* is nonpositive.

?ppequ

Computes row and column scaling factors intended to equilibrate a symmetric (Hermitian) positive definite matrix in packed storage and reduce its condition number.

Syntax

call sppequ(*uplo*, *n*, *ap*, *s*, *scond*, *amax*, *info*)

call dppequ(*uplo*, *n*, *ap*, *s*, *scond*, *amax*, *info*)

```
call cppequ( uplo, n, ap, s, scond, amax, info )
call zppequ( uplo, n, ap, s, scond, amax, info )
call ppequ( ap, s [,scond] [,amax] [,uplo] [,info] )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes row and column scalings intended to equilibrate a symmetric (Hermitian) positive definite matrix A in packed storage and reduce its condition number (with respect to the two-norm). The output array s returns scale factors such that $s(i) s[i + 1]$ contains

$$|a_{ij}| s(i) s(j)$$

These factors are chosen so that the scaled matrix B with elements $b_{ij} = s(i) * a_{ij} * s(j)$ has diagonal elements equal to 1.

This choice of s puts the condition number of B within a factor n of the smallest possible condition number over all possible diagonal scalings.

See [?laqsp](#) auxiliary function that uses scaling factors computed by `?ppequ`.

Input Parameters

<i>uplo</i>	CHARACTER*1. Must be 'U' or 'L'. Indicates whether the upper or lower triangular part of A is packed in the array <i>ap</i> : If <i>uplo</i> = 'U', the array <i>ap</i> stores the upper triangular part of the matrix A . If <i>uplo</i> = 'L', the array <i>ap</i> stores the lower triangular part of the matrix A .
<i>n</i>	INTEGER. The order of matrix A ; $n \geq 0$.
<i>ap</i>	REAL for <code>sppequ</code> DOUBLE PRECISION for <code>dppequ</code> COMPLEX for <code>cppequ</code> DOUBLE COMPLEX for <code>zppequ</code> . Array, size at least $\max(1, n(n+1)/2)$. The array <i>ap</i> contains the upper or the lower triangular part of the matrix A (as specified by <i>uplo</i>) in <i>packed storage</i> (see Matrix Storage Schemes).

Output Parameters

<i>s</i>	REAL for single precision flavors DOUBLE PRECISION for double precision flavors.
----------	---

Array, size (n).

If $info = 0$, the array s contains the scale factors for A .

scond

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

If $info = 0$, *scond* contains the ratio of the smallest $s(i)$ to the largest $s(i)$.

amax

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Absolute value of the largest element of the matrix A .

info

INTEGER.

If $info = 0$, the execution is successful.

If $info = -i$, the i -th parameter had an illegal value.

If $info = i$, the i -th diagonal element of A is nonpositive.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `ppequ` interface are as follows:

ap

Holds the array A of size $(n*(n+1)/2)$.

s

Holds the vector of length n .

uplo

Must be 'U' or 'L'. The default value is 'U'.

Application Notes

If $scond \geq 0.1$ and *amax* is neither too large nor too small, it is not worth scaling by s .

If *amax* is very close to `SMLNUM` or very close to `BIGNUM`, the matrix A should be scaled.

Description

The routine solves for X the system of linear equations $A^*X = B$, where A is an n -by- n matrix, the columns of matrix B are individual right-hand sides, and the columns of X are the corresponding solutions.

The LU decomposition with partial pivoting and row interchanges is used to factor A as $A = P^*L^*U$, where P is a permutation matrix, L is unit lower triangular, and U is upper triangular. The factored form of A is then used to solve the system of equations $A^*X = B$.

The `dsgeev` and `zcgesv` are mixed precision iterative refinement subroutines for exploiting fast single precision hardware. They first attempt to factorize the matrix in single precision (`dsgeev`) or single complex precision (`zcgesv`) and use this factorization within an iterative refinement procedure to produce a solution with double precision (`dsgeev`) / double complex precision (`zcgesv`) normwise backward error quality (see below). If the approach fails, the method switches to a double precision or double complex precision factorization respectively and computes the solution.

The iterative refinement is not going to be a winning strategy if the ratio single precision performance over double precision performance is too small. A reasonable strategy should take the number of right-hand sides and the size of the matrix into account. This might be done with a call to `ilaenv` in the future. At present, iterative refinement is implemented.

The iterative refinement process is stopped if

```
iter > itermax
```

or for all the right-hand sides:

```
rnmr < sqrt(n)*xnmr*anrm*eps*bwdmax
```

where

- `iter` is the number of the current iteration in the iterative refinement process
- `rnmr` is the infinity-norm of the residual
- `xnmr` is the infinity-norm of the solution
- `anrm` is the infinity-operator-norm of the matrix A
- `eps` is the machine epsilon returned by `dlamch` ('Epsilon').

The values `itermax` and `bwdmax` are fixed to 30 and 1.0d+00 respectively.

Input Parameters

<code>n</code>	INTEGER. The number of linear equations, that is, the order of the matrix A ; $n \geq 0$.
<code>nrhs</code>	INTEGER. The number of right-hand sides, that is, the number of columns of the matrix B ; $nrhs \geq 0$.
<code>a</code>	REAL for <code>sgesv</code>

DOUBLE PRECISION for dgesv and dsgeev

COMPLEX for cgesv

DOUBLE COMPLEX for zgesv and zcgesv.

The array a (size lda by $*$) contains the n -by- n coefficient matrix A .

The second dimension of a must be at least $\max(1, n)$, the second dimension of b at least $\max(1, nrhs)$.

b

REAL for sgesv

DOUBLE PRECISION for dgesv and dsgeev

COMPLEX for cgesv

DOUBLE COMPLEX for zgesv and zcgesv.

The array b (size ldb by $*$) contains the n -by- $nrhs$ matrix of right hand side matrix B .

lda

INTEGER. The leading dimension of the array a ; $lda \geq \max(1, n)$.

ldb

INTEGER. The leading dimension of the array b ; $ldb \geq \max(1, n)$.

ldx

INTEGER. The leading dimension of the array x ; $ldx \geq \max(1, n)$.

$work$

DOUBLE PRECISION for dsgeev

DOUBLE COMPLEX for zcgesv.

Workspace array, size at least $\max(1, n*nrhs)$. This array is used to hold the residual vectors.

$swork$

REAL for dsgeev

COMPLEX for zcgesv.

Workspace array, size at least $\max(1, n*(n+nrhs))$. This array is used to use the single precision matrix and the right-hand sides or solutions in single precision.

$rwork$

DOUBLE PRECISION. Workspace array, size at least $\max(1, n)$.

Output Parameters

a

Overwritten by the factors L and U from the factorization of $A = P*L*U$; the unit diagonal elements of L are not stored.

If iterative refinement has been successfully used ($info=0$ and $iter \geq 0$), then A is unchanged.

If double precision factorization has been used ($info=0$ and $iter < 0$), then the array A contains the factors L and U from the factorization $A = P*L*U$; the unit diagonal elements of L are not stored.

b

Overwritten by the solution matrix X for dgesv, sgesv, zgesv, zcgesv. Unchanged for dsgeev and zcgesv.

<i>ipiv</i>	<p>INTEGER.</p> <p>Array, size at least $\max(1, n)$. The pivot indices that define the permutation matrix P; row i of the matrix was interchanged with row $ipiv(i)$. Corresponds to the single precision factorization (if $info=0$ and $iter \geq 0$) or the double precision factorization (if $info=0$ and $iter < 0$).</p>
<i>x</i>	<p>DOUBLE PRECISION for <code>dsgesv</code></p> <p>DOUBLE COMPLEX for <code>zcgesv</code>.</p> <p>Array, size ldx by $nrhs$. If $info = 0$, contains the n-by-$nrhs$ solution matrix X.</p>
<i>iter</i>	<p>INTEGER.</p> <p>If $iter < 0$: iterative refinement has failed, double precision factorization has been performed</p> <ul style="list-style-type: none"> • If $iter = -1$: the routine fell back to full precision for implementation- or machine-specific reason • If $iter = -2$: narrowing the precision induced an overflow, the routine fell back to full precision • If $iter = -3$: failure of <code>sgetrf</code> for <code>dsgesv</code>, or <code>cgetrf</code> for <code>zcgesv</code> • If $iter = -31$: stop the iterative refinement after the 30th iteration. <p>If $iter > 0$: iterative refinement has been successfully used. Returns the number of iterations.</p>
<i>info</i>	<p>INTEGER. If $info=0$, the execution is successful.</p> <p>If $info = -i$, the i-th parameter had an illegal value.</p> <p>If $info = i$, $U_{i,i}$ (computed in double precision for mixed precision subroutines) is exactly zero. The factorization has been completed, but the factor U is exactly singular, so the solution could not be computed.</p>

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `gesv` interface are as follows:

<i>a</i>	Holds the matrix A of size (n, n) .
<i>b</i>	Holds the matrix B of size $(n, nrhs)$.
<i>ipiv</i>	Holds the vector of length n .

NOTE

Fortran 95 Interface is so far not available for the mixed precision subroutines `dsgesv/zcgesv`.

```

Include Files

- `mkl.fi`, `lapack.f90`

Description

The routine uses the LU factorization to compute the solution to a real or complex system of linear equations $A \cdot X = B$, where A is an n -by- n matrix, the columns of matrix B are individual right-hand sides, and the columns of X are the corresponding solutions.

Error bounds on the solution and a condition estimate are also provided.

The routine `?gesvx` performs the following steps:

1. If `fact = 'E'`, real scaling factors r and c are computed to equilibrate the system:

$$trans = 'N': \text{diag}(r) * A * \text{diag}(c) * \text{inv}(\text{diag}(c)) * X = \text{diag}(r) * B$$

$$trans = 'T': (\text{diag}(r) * A * \text{diag}(c))^T * \text{inv}(\text{diag}(r)) * X = \text{diag}(c) * B$$

$$trans = 'C': (\text{diag}(r) * A * \text{diag}(c))^H * \text{inv}(\text{diag}(r)) * X = \text{diag}(c) * B$$

Whether or not the system will be equilibrated depends on the scaling of the matrix A , but if equilibration is used, A is overwritten by $\text{diag}(r) * A * \text{diag}(c)$ and B by $\text{diag}(r) * B$ (if `trans='N'`) or $\text{diag}(c) * B$ (if `trans = 'T' or 'C'`).

2. If `fact = 'N' or 'E'`, the LU decomposition is used to factor the matrix A (after equilibration if `fact = 'E'`) as $A = P * L * U$, where P is a permutation matrix, L is a unit lower triangular matrix, and U is upper triangular.
3. If some $U_{i,i} = 0$, so that U is exactly singular, then the routine returns with `info = i`. Otherwise, the factored form of A is used to estimate the condition number of the matrix A . If the reciprocal of the condition number is less than machine precision, `info = n + 1` is returned as a warning, but the routine still goes on to solve for X and compute error bounds as described below.

4. The system of equations is solved for X using the factored form of A .
5. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.
6. If equilibration was used, the matrix X is premultiplied by $\text{diag}(c)$ (if $\text{trans} = 'N'$) or $\text{diag}(r)$ (if $\text{trans} = 'T'$ or $'C'$) so that it solves the original system before equilibration.

Input Parameters

fact

CHARACTER*1. Must be 'F', 'N', or 'E'.

Specifies whether or not the factored form of the matrix A is supplied on entry, and if not, whether the matrix A should be equilibrated before it is factored.

If $\text{fact} = 'F'$: on entry, af and $ipiv$ contain the factored form of A . If equed is not 'N', the matrix A has been equilibrated with scaling factors given by r and c .

a , af , and $ipiv$ are not modified.

If $\text{fact} = 'N'$, the matrix A will be copied to af and factored.

If $\text{fact} = 'E'$, the matrix A will be equilibrated if necessary, then copied to af and factored.

trans

CHARACTER*1. Must be 'N', 'T', or 'C'.

Specifies the form of the system of equations:

If $\text{trans} = 'N'$, the system has the form $A * X = B$ (No transpose).

If $\text{trans} = 'T'$, the system has the form $A^T * X = B$ (Transpose).

If $\text{trans} = 'C'$, the system has the form $A^H * X = B$ (Transpose for real flavors, conjugate transpose for complex flavors).

n

INTEGER. The number of linear equations; the order of the matrix A ; $n \geq 0$.

nrhs

INTEGER. The number of right hand sides; the number of columns of the matrices B and X ; $nrhs \geq 0$.

a

REAL for sgesvx

DOUBLE PRECISION for dgesvx

COMPLEX for cgesvx

DOUBLE COMPLEX for zgesvx.

The array a (size lda by $*$) contains the matrix A . If $\text{fact} = 'F'$ and equed is not 'N', then A must have been equilibrated by the scaling factors in r and/or c . The second dimension of a must be at least $\max(1, n)$.

af

REAL for sgesvx

DOUBLE PRECISION for dgesvx

COMPLEX for cgesvx

DOUBLE COMPLEX for zgesvx.

The array *afaf*(size *ldaf* by *) is an input argument if *fact* = 'F'. It contains the factored form of the matrix *A*, that is, the factors *L* and *U* from the factorization $A = P * L * U$ as computed by [?getrf](#). If *equed* is not 'N', then *af* is the factored form of the equilibrated matrix *A*. The second dimension of *af* must be at least $\max(1, n)$.

b

REAL for sgesvx
DOUBLE PRECISION for dgesvx
COMPLEX for cgesvx
DOUBLE COMPLEX for zgesvx.

The array *bb*(size *ldb* by *) contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least $\max(1, nrhs)$.

, work

REAL for sgesvx
DOUBLE PRECISION for dgesvx
COMPLEX for cgesvx
DOUBLE COMPLEX for zgesvx.

work(*) is a workspace array. The dimension of *work* must be at least $\max(1, 4 * n)$ for real flavors, and at least $\max(1, 2 * n)$ for complex flavors.

lda

INTEGER. The leading dimension of *a*; $lda \geq \max(1, n)$.

ldaf

INTEGER. The leading dimension of *af*; $ldaf \geq \max(1, n)$.

ldb

INTEGER. The leading dimension of *b*; $ldb \geq \max(1, n)$.

ipiv

INTEGER.

Array, size at least $\max(1, n)$. The array *ipiv* is an input argument if *fact* = 'F'. It contains the pivot indices from the factorization $A = P * L * U$ as computed by [?getrf](#); row *i* of the matrix was interchanged with row *ipiv*(*i*).

equed

CHARACTER*1. Must be 'N', 'R', 'C', or 'B'.

equed is an input argument if *fact* = 'F'. It specifies the form of equilibration that was done:

If *equed* = 'N', no equilibration was done (always true if *fact* = 'N').

If *equed* = 'R', row equilibration was done, that is, *A* has been premultiplied by *diag*(*r*).

If *equed* = 'C', column equilibration was done, that is, *A* has been postmultiplied by *diag*(*c*).

If *equed* = 'B', both row and column equilibration was done, that is, *A* has been replaced by *diag*(*r*) * *A* * *diag*(*c*).

r, c

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Arrays: r (size n), c (size n). The array r contains the row scale factors for A , and the array c contains the column scale factors for A . These arrays are input arguments if $fact = 'F'$ only; otherwise they are output arguments.

If $equed = 'R'$ or $'B'$, A is multiplied on the left by $diag(r)$; if $equed = 'N'$ or $'C'$, r is not accessed.

If $fact = 'F'$ and $equed = 'R'$ or $'B'$, each element of r must be positive.

If $equed = 'C'$ or $'B'$, A is multiplied on the right by $diag(c)$; if $equed = 'N'$ or $'R'$, c is not accessed.

If $fact = 'F'$ and $equed = 'C'$ or $'B'$, each element of c must be positive.

ldx

INTEGER. The leading dimension of the output array x ; $ldx \geq \max(1, n)$.

$iwork$

INTEGER. Workspace array, size at least $\max(1, n)$; used in real flavors only.

$rwork$

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Workspace array, size at least $\max(1, 2*n)$; used in complex flavors only.

Output Parameters

x

REAL for sgesvx

DOUBLE PRECISION for dgesvx

COMPLEX for cgesvx

DOUBLE COMPLEX for zgesvx.

Array, size ldx by $*$.

If $info = 0$ or $info = n+1$, the array x contains the solution matrix X to the *original* system of equations. Note that A and B are modified on exit if $equed \neq 'N'$, and the solution to the *equilibrated* system is:

$diag(C)^{-1} * X$, if $trans = 'N'$ and $equed = 'C'$ or $'B'$;

$diag(R)^{-1} * X$, if $trans = 'T'$ or $'C'$ and $equed = 'R'$ or $'B'$. The second dimension of x must be at least $\max(1, nrhs)$.

a

Array a is not modified on exit if $fact = 'F'$ or $'N'$, or if $fact = 'E'$ and $equed = 'N'$. If $equed \neq 'N'$, A is scaled on exit as follows:

$equed = 'R'$: $A = diag(R) * A$

$equed = 'C'$: $A = A * diag(c)$

$equed = 'B'$: $A = diag(R) * A * diag(c)$.

<i>af</i>	If <i>fact</i> = 'N' or 'E', then <i>af</i> is an output argument and on exit returns the factors <i>L</i> and <i>U</i> from the factorization $A = PLU$ of the original matrix <i>A</i> (if <i>fact</i> = 'N') or of the equilibrated matrix <i>A</i> (if <i>fact</i> = 'E'). See the description of <i>a</i> for the form of the equilibrated matrix.
<i>b</i>	Overwritten by <i>diag(r)*B</i> if <i>trans</i> = 'N' and <i>equed</i> = 'R' or 'B'; overwritten by <i>diag(c)*B</i> if <i>trans</i> = 'T' or 'C' and <i>equed</i> = 'C' or 'B'; not changed if <i>equed</i> = 'N'.
<i>r, c</i>	These arrays are output arguments if <i>fact</i> ≠ 'F'. See the description of <i>r, c</i> in <i>Input Arguments</i> section.
<i>rcond</i>	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. An estimate of the reciprocal condition number of the matrix <i>A</i> after equilibration (if done). If <i>rcond</i> is less than the machine precision, in particular, if <i>rcond</i> = 0, the matrix is singular to working precision. This condition is indicated by a return code of <i>info</i> > 0.
<i>ferr</i>	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Array, size at least $\max(1, nrhs)$. Contains the estimated forward error bound for each solution vector $x(j)$ (the <i>j</i> -th column of the solution matrix <i>X</i>). If <i>xtrue</i> is the true solution corresponding to $x(j)$, <i>ferr(j)</i> is an estimated upper bound for the magnitude of the largest element in $(x(j) - xtrue)$ divided by the magnitude of the largest element in $x(j)$. The estimate is as reliable as the estimate for <i>rcond</i> , and is almost always a slight overestimate of the true error.
<i>berr</i>	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Array, size at least $\max(1, nrhs)$. Contains the component-wise relative backward error for each solution vector $x(j)$, that is, the smallest relative change in any element of <i>A</i> or <i>B</i> that makes $x(j)$ an exact solution.
<i>ipiv</i>	If <i>fact</i> = 'N' or 'E', then <i>ipiv</i> is an output argument and on exit contains the pivot indices from the factorization $A = P*L*U$ of the original matrix <i>A</i> (if <i>fact</i> = 'N') or of the equilibrated matrix <i>A</i> (if <i>fact</i> = 'E').
<i>equed</i>	If <i>fact</i> ≠ 'F', then <i>equed</i> is an output argument. It specifies the form of equilibration that was done (see the description of <i>equed</i> in <i>Input Arguments</i> section).
<i>work, rwork</i>	On exit, <i>work</i> (1) for real flavors, or <i>rwork</i> (1) for complex flavors (the Fortran interface) contains the reciprocal pivot growth factor $\text{norm}(A)/\text{norm}(U)$. The "max absolute element" norm is used. If

$work(1)$ for real flavors, or $rwork(1)$ for complex flavors is much less than 1, then the stability of the LU factorization of the (equilibrated) matrix A could be poor. This also means that the solution x , condition estimator $rcond$, and forward error bound $ferr$ could be unreliable. If factorization fails with $0 < info \leq n$, then $work(1)$ for real flavors, or $rwork(1)$ for complex flavors contains the reciprocal pivot growth factor for the leading $info$ columns of A .

info

INTEGER. If $info = 0$, the execution is successful.

If $info = -i$, the i -th parameter had an illegal value.

If $info = i$, and $i \leq n$, then $U(i, i)$ is exactly zero. The factorization has been completed, but the factor U is exactly singular, so the solution and error bounds could not be computed; $rcond = 0$ is returned.

If $info = n + 1$, then U is nonsingular, but $rcond$ is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of $rcond$ would suggest.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `gesvx` interface are as follows:

<i>a</i>	Holds the matrix A of size (n, n) .
<i>b</i>	Holds the matrix B of size $(n, nrhs)$.
<i>x</i>	Holds the matrix X of size $(n, nrhs)$.
<i>af</i>	Holds the matrix AF of size (n, n) .
<i>ipiv</i>	Holds the vector of length n .
<i>r</i>	Holds the vector of length n . Default value for each element is $r(i) = 1.0_WP$.
<i>c</i>	Holds the vector of length n . Default value for each element is $c(i) = 1.0_WP$.
<i>ferr</i>	Holds the vector of length $(nrhs)$.
<i>berr</i>	Holds the vector of length $(nrhs)$.
<i>fact</i>	Must be 'N', 'E', or 'F'. The default value is 'N'. If $fact = 'F'$, then both arguments <i>af</i> and <i>ipiv</i> must be present; otherwise, an error is returned.
<i>trans</i>	Must be 'N', 'C', or 'T'. The default value is 'N'.
<i>equed</i>	Must be 'N', 'B', 'C', or 'R'. The default value is 'N'.

rpvgrw

Real value that contains the reciprocal pivot growth factor $\text{norm}(A)/\text{norm}(U)$.

Description

The routine uses the LU factorization to compute the solution to a real or complex system of linear equations $A \cdot X = B$, where A is an n -by- n matrix, the columns of the matrix B are individual right-hand sides, and the columns of X are the corresponding solutions.

Both normwise and maximum componentwise error bounds are also provided on request. The routine returns a solution with a small guaranteed error ($O(\text{eps})$, where `eps` is the working machine precision) unless the matrix is very ill-conditioned, in which case a warning is returned. Relevant condition numbers are also calculated and returned.

The routine accepts user-provided factorizations and equilibration factors; see definitions of the *fact* and *equed* options. Solving with refinement and using a factorization from a previous call of the routine also produces a solution with $O(\text{eps})$ errors or warnings but that may not be true for general user-provided factorizations and equilibration factors if they differ from what the routine would itself produce.

The routine `?gesvxx` performs the following steps:

1. If *fact* = 'E', scaling factors *r* and *c* are computed to equilibrate the system:

$$\text{trans} = \text{'N'}: \text{diag}(r) * A * \text{diag}(c) * \text{inv}(\text{diag}(c)) * X = \text{diag}(r) * B$$

$$\text{trans} = \text{'T'}: (\text{diag}(r) * A * \text{diag}(c))^T * \text{inv}(\text{diag}(r)) * X = \text{diag}(c) * B$$

$$\text{trans} = \text{'C'}: (\text{diag}(r) * A * \text{diag}(c))^H * \text{inv}(\text{diag}(r)) * X = \text{diag}(c) * B$$

Whether or not the system will be equilibrated depends on the scaling of the matrix A , but if equilibration is used, A is overwritten by $\text{diag}(r) * A * \text{diag}(c)$ and B by $\text{diag}(r) * B$ (if $\text{trans} = 'N'$) or $\text{diag}(c) * B$ (if $\text{trans} = 'T'$ or $'C'$).

2. If $\text{fact} = 'N'$ or $'E'$, the LU decomposition is used to factor the matrix A (after equilibration if $\text{fact} = 'E'$) as $A = P * L * U$, where P is a permutation matrix, L is a unit lower triangular matrix, and U is upper triangular.
3. If some $U_{i,i} = 0$, so that U is exactly singular, then the routine returns with $\text{info} = i$. Otherwise, the factored form of A is used to estimate the condition number of the matrix A (see the rcond parameter). If the reciprocal of the condition number is less than machine precision, the routine still goes on to solve for X and compute error bounds.
4. The system of equations is solved for X using the factored form of A .
5. By default, unless $\text{params}(\text{la_linrx_itref_i})$ is set to zero, the routine applies iterative refinement to improve the computed solution matrix and calculate error bounds. Refinement calculates the residual to at least twice the working precision.
6. If equilibration was used, the matrix X is premultiplied by $\text{diag}(c)$ (if $\text{trans} = 'N'$) or $\text{diag}(r)$ (if $\text{trans} = 'T'$ or $'C'$) so that it solves the original system before equilibration.

Input Parameters

<i>fact</i>	<p>CHARACTER*1. Must be 'F', 'N', or 'E'.</p> <p>Specifies whether or not the factored form of the matrix A is supplied on entry, and if not, whether the matrix A should be equilibrated before it is factored.</p> <p>If $\text{fact} = 'F'$, on entry, a and ipiv contain the factored form of A. If equed is not 'N', the matrix A has been equilibrated with scaling factors given by r and c. Parameters a, a, a, and ipiv are not modified.</p> <p>If $\text{fact} = 'N'$, the matrix A will be copied to a and factored.</p> <p>If $\text{fact} = 'E'$, the matrix A will be equilibrated, if necessary, copied to a and factored.</p>
<i>trans</i>	<p>CHARACTER*1. Must be 'N', 'T', or 'C'.</p> <p>Specifies the form of the system of equations:</p> <p>If $\text{trans} = 'N'$, the system has the form $A * X = B$ (No transpose).</p> <p>If $\text{trans} = 'T'$, the system has the form $A^T * X = B$ (Transpose).</p> <p>If $\text{trans} = 'C'$, the system has the form $A^H * X = B$ (Conjugate Transpose = Transpose for real flavors, Conjugate Transpose for complex flavors).</p>
<i>n</i>	<p>INTEGER. The number of linear equations; the order of the matrix A; $n \geq 0$.</p>
<i>nrhs</i>	<p>INTEGER. The number of right hand sides; the number of columns of the matrices B and X; $\text{nrhs} \geq 0$.</p>
<i>a, af, b, work</i>	<p>REAL for sgesvxx</p> <p>DOUBLE PRECISION for dgesvxx</p> <p>COMPLEX for cgesvxx</p> <p>DOUBLE COMPLEX for zgesvxx.</p> <p>Arrays: $a(\text{size } lda \text{ by } *)$, $a(\text{size } ldaf \text{ by } *)$, $b(\text{size } ldb \text{ by } *)$, $work(*)$.</p>

The array *a* contains the matrix *A*. If *fact* = 'F' and *equed* is not 'N', then *A* must have been equilibrated by the scaling factors in *r* and/or *c*. The second dimension of *a* must be at least $\max(1, n)$.

The array *af* is an input argument if *fact* = 'F'. It contains the factored form of the matrix *A*, that is, the factors *L* and *U* from the factorization $A = P*L*U$ as computed by [?getrf](#). If *equed* is not 'N', then *af* is the factored form of the equilibrated matrix *A*. The second dimension of *af* must be at least $\max(1, n)$.

The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least $\max(1, nrhs)$.

work()* is a workspace array. The dimension of *work* must be at least $\max(1, 4*n)$ for real flavors, and at least $\max(1, 2*n)$ for complex flavors.

lda INTEGER. The leading dimension of *a*; $lda \geq \max(1, n)$.

ldaf INTEGER. The leading dimension of *af*; $ldaf \geq \max(1, n)$.

ipiv INTEGER.

Array, size at least $\max(1, n)$. The array *ipiv* is an input argument if *fact* = 'F'. It contains the pivot indices from the factorization $A = P*L*U$ as computed by [?getrf](#); row *i* of the matrix was interchanged with row *ipiv(i)*.

equed CHARACTER*1. Must be 'N', 'R', 'C', or 'B'.

equed is an input argument if *fact* = 'F'. It specifies the form of equilibration that was done:

If *equed* = 'N', no equilibration was done (always true if *fact* = 'N').

If *equed* = 'R', row equilibration was done, that is, *A* has been premultiplied by *diag(r)*.

If *equed* = 'C', column equilibration was done, that is, *A* has been postmultiplied by *diag(c)*.

If *equed* = 'B', both row and column equilibration was done, that is, *A* has been replaced by *diag(r)*A*diag(c)*.

r, c REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Arrays: *r* (size *n*), *c* (size *n*). The array *r* contains the row scale factors for *A*, and the array *c* contains the column scale factors for *A*. These arrays are input arguments if *fact* = 'F' only; otherwise they are output arguments.

If *equed* = 'R' or 'B', *A* is multiplied on the left by *diag(r)*; if *equed* = 'N' or 'C', *r* is not accessed.

If *fact* = 'F' and *equed* = 'R' or 'B', each element of *r* must be positive.

If *equed* = 'C' or 'B', *A* is multiplied on the right by *diag(c)*; if *equed* = 'N' or 'R', *c* is not accessed.

If *fact* = 'F' and *equed* = 'C' or 'B', each element of *c* must be positive.

Each element of *r* or *c* should be a power of the radix to ensure a reliable solution and error estimates. Scaling by powers of the radix does not cause rounding errors unless the result underflows or overflows. Rounding errors during scaling lead to refining with a matrix that is not equivalent to the input matrix, producing error estimates that may not be reliable.

<i>ldb</i>	INTEGER. The leading dimension of the array <i>b</i> ; $ldb \geq \max(1, n)$.								
<i>ldx</i>	INTEGER. The leading dimension of the output array <i>x</i> ; $ldx \geq \max(1, n)$.								
<i>n_err_bnds</i>	INTEGER. Number of error bounds to return for each right hand side and each type (normwise or componentwise). See <i>err_bnds_norm</i> and <i>err_bnds_comp</i> descriptions in <i>Output Arguments</i> section below.								
<i>nparams</i>	INTEGER. Specifies the number of parameters set in <i>params</i> . If ≤ 0 , the <i>params</i> array is never referenced and default values are used.								
<i>params</i>	<p>REAL for single precision flavors</p> <p>DOUBLE PRECISION for double precision flavors.</p> <p>Array, size $\max(1, nparams)$. Specifies algorithm parameters. If an entry is less than 0.0, that entry is filled with the default value used for that parameter. Only positions up to <i>nparams</i> are accessed; defaults are used for higher-numbered parameters. If defaults are acceptable, you can pass <i>nparams</i> = 0, which prevents the source code from accessing the <i>params</i> argument.</p> <p><i>params</i>(1) : Whether to perform iterative refinement or not. Default: 1.0</p> <table> <tr> <td>=0.0</td><td>No refinement is performed and no error bounds are computed.</td></tr> <tr> <td>=1.0</td><td>Use the double-precision refinement algorithm, possibly with doubled-single computations if the compilation environment does not support double precision.</td></tr> </table> <p>(Other values are reserved for future use.)</p> <p><i>params</i>(2) : Maximum number of residual computations allowed for refinement.</p> <table> <tr> <td>Default</td><td>10.0</td></tr> <tr> <td>Aggressive</td><td>Set to 100.0 to permit convergence using approximate factorizations or factorizations other than <i>LU</i>. If the factorization uses a technique other than Gaussian elimination, the guarantees in <i>err_bnds_norm</i> and <i>err_bnds_comp</i> may no longer be trustworthy.</td></tr> </table>	=0.0	No refinement is performed and no error bounds are computed.	=1.0	Use the double-precision refinement algorithm, possibly with doubled-single computations if the compilation environment does not support double precision.	Default	10.0	Aggressive	Set to 100.0 to permit convergence using approximate factorizations or factorizations other than <i>LU</i> . If the factorization uses a technique other than Gaussian elimination, the guarantees in <i>err_bnds_norm</i> and <i>err_bnds_comp</i> may no longer be trustworthy.
=0.0	No refinement is performed and no error bounds are computed.								
=1.0	Use the double-precision refinement algorithm, possibly with doubled-single computations if the compilation environment does not support double precision.								
Default	10.0								
Aggressive	Set to 100.0 to permit convergence using approximate factorizations or factorizations other than <i>LU</i> . If the factorization uses a technique other than Gaussian elimination, the guarantees in <i>err_bnds_norm</i> and <i>err_bnds_comp</i> may no longer be trustworthy.								

params(3) : Flag determining if the code will attempt to find a solution with a small componentwise relative error in the double-precision algorithm. Positive is true, 0.0 is false. Default: 1.0 (attempt componentwise convergence).

iwork INTEGER. Workspace array, size at least $\max(1, n)$; used in real flavors only.

rwork REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Workspace array, size at least $\max(1, 3*n)$; used in complex flavors only.

Output Parameters

x REAL for sgesvxx
DOUBLE PRECISION for dgesvxx
COMPLEX for cgesvxx
DOUBLE COMPLEX for zgesvxx.

Array, size $(ldx, *)$.

If *info* = 0, the array *x* contains the solution *n*-by-*nrhs* matrix *X* to the *original* system of equations. Note that *A* and *B* are modified on exit if *equed* ≠ 'N', and the solution to the *equilibrated* system is:

$\text{inv}(\text{diag}(c)) * X$, if *trans* = 'N' and *equed* = 'C' or 'B'; or
 $\text{inv}(\text{diag}(r)) * X$, if *trans* = 'T' or 'C' and *equed* = 'R' or 'B'. The second dimension of *x* must be at least $\max(1, nrhs)$.

a Array *a* is not modified on exit if *fact* = 'F' or 'N', or if *fact* = 'E' and *equed* = 'N'.

If *equed* ≠ 'N', *A* is scaled on exit as follows:

equed = 'R': $A = \text{diag}(r) * A$

equed = 'C': $A = A * \text{diag}(c)$

equed = 'B': $A = \text{diag}(r) * A * \text{diag}(c)$.

af If *fact* = 'N' or 'E', then *af* is an output argument and on exit returns the factors *L* and *U* from the factorization $A = PLU$ of the original matrix *A* (if *fact* = 'N') or of the equilibrated matrix *A* (if *fact* = 'E'). See the description of *a* for the form of the equilibrated matrix.

b Overwritten by $\text{diag}(r) * B$ if *trans* = 'N' and *equed* = 'R' or 'B';
overwritten by *trans* = 'T' or 'C' and *equed* = 'C' or 'B';
not changed if *equed* = 'N'.

r, c These arrays are output arguments if *fact* ≠ 'F'. Each element of these arrays is a power of the radix. See the description of *r, c* in *Input Arguments* section.

rcond REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Reciprocal scaled condition number. An estimate of the reciprocal Skeel condition number of the matrix A after equilibration (if done). If $rcond$ is less than the machine precision, in particular, if $rcond = 0$, the matrix is singular to working precision. Note that the error may still be small even if this number is very small and the matrix appears ill-conditioned.

rpvgrw

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Contains the reciprocal pivot growth factor:

$$\|A\|/\|U\|$$

If this is much less than 1, the stability of the LU factorization of the (equilibrated) matrix A could be poor. This also means that the solution X , estimated condition numbers, and error bounds could be unreliable. If factorization fails with $0 < info \leq n$, this parameter contains the reciprocal pivot growth factor for the leading $info$ columns of A . In `?gesvx`, this quantity is returned in `work(1)`.

berr

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, size at least $\max(1, nrhs)$. Contains the componentwise relative backward error for each solution vector $x(j)$, that is, the smallest relative change in any element of A or B that makes $x(j)$ an exact solution.

err_bnds_norm

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array of size $nrhs$ by n_err_bnds . For each right-hand side, contains information about various error bounds and condition numbers corresponding to the normwise relative error, which is defined as follows:

Normwise relative error in the i -th solution vector

$$\frac{\max_j |X_{true_{ji}} - X_{ji}|}{\max_j |X_{ji}|}$$

The array is indexed by the type of error information as described below. There are currently up to three pieces of information returned.

The first index in `err_bnds_norm(i,:)` corresponds to the i -th right-hand side.

The second index in `err_bnds_norm(:,err)` contains the following three fields:

err=1

"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold $\sqrt{n} * \text{slamch}(\epsilon)$ for single precision flavors and $\sqrt{n} * \text{dlamch}(\epsilon)$ for double precision flavors.

`err=2`

"Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold $\sqrt{n} * \text{slamch}(\epsilon)$ for single precision flavors and $\sqrt{n} * \text{dlamch}(\epsilon)$ for double precision flavors. This error bound should only be trusted if the previous boolean is true.

`err=3`

Reciprocal condition number. Estimated normwise reciprocal condition number. Compared with the threshold $\sqrt{n} * \text{slamch}(\epsilon)$ for single precision flavors and $\sqrt{n} * \text{dlamch}(\epsilon)$ for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix Z are:

$$\|Z\|_{\infty} \cdot \|Z^{-1}\|_{\infty}$$

Let $z = s * a$, where s scales each row by a power of the radix so all absolute row sums of z are approximately 1.

`err_bnds_comp`

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array of size `nrhs` by `n_err_bnds`. For each right-hand side, contains information about various error bounds and condition numbers corresponding to the componentwise relative error, which is defined as follows:

Componentwise relative error in the i -th solution vector:

$$\max_j \frac{|X_{true_{ji}} - X_{ji}|}{|X_{ji}|}$$

The array is indexed by the right-hand side i , on which the componentwise relative error depends, and by the type of error information as described below. There are currently up to three pieces of information returned for each right-hand side. If componentwise accuracy is not requested (`params(3) = 0.0`), then `err_bnds_comp` is not accessed. If `n_err_bnds < 3`, then at most the first `(:,n_err_bnds)` entries are returned.

The first index in `err_bnds_comp(i,:)` corresponds to the i -th right-hand side.

The second index in `err_bnds_comp(:,err)` contains the following three fields:

<code>err=1</code>	"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold $\sqrt{n} * \text{slamch}(\epsilon)$ for single precision flavors and $\sqrt{n} * \text{dlamch}(\epsilon)$ for double precision flavors.
<code>err=2</code>	"Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold $\sqrt{n} * \text{slamch}(\epsilon)$ for single precision flavors and $\sqrt{n} * \text{dlamch}(\epsilon)$ for double precision flavors. This error bound should only be trusted if the previous boolean is true.
<code>err=3</code>	Reciprocal condition number. Estimated componentwise reciprocal condition number. Compared with the threshold $\sqrt{n} * \text{slamch}(\epsilon)$ for single precision flavors and $\sqrt{n} * \text{dlamch}(\epsilon)$ for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix Z are: $\ Z\ _{\infty} \cdot \ Z^{-1}\ _{\infty}$ <p>Let $z = s^*(a * \text{diag}(x))$, where x is the solution for the current right-hand side and s scales each row of $a * \text{diag}(x)$ by a power of the radix so all absolute row sums of z are approximately 1.</p>
<code>ipiv</code>	If <code>fact = 'N'</code> or <code>'E'</code> , then <code>ipiv</code> is an output argument and on exit contains the pivot indices from the factorization $A = P * L * U$ of the original matrix A (if <code>fact = 'N'</code>) or of the equilibrated matrix A (if <code>fact = 'E'</code>).
<code>equed</code>	If <code>fact ≠ 'F'</code> , then <code>equed</code> is an output argument. It specifies the form of equilibration that was done (see the description of <code>equed</code> in <i>Input Arguments</i> section).
<code>params</code>	If an entry is less than 0.0, that entry is filled with the default value used for that parameter, otherwise the entry is not modified
<code>info</code>	INTEGER. If <code>info = 0</code> , the execution is successful. The solution to every right-hand side is guaranteed. If <code>info = -i</code> , the i -th parameter had an illegal value. If $0 < \text{info} \leq n$: $U(\text{info}, \text{info})$ is exactly zero. The factorization has been completed, but the factor U is exactly singular, so the solution and error bounds could not be computed; <code>rcond = 0</code> is returned. If <code>info = n+j</code> : The solution corresponding to the j -th right-hand side is not guaranteed. The solutions corresponding to other right-hand sides k with $k > j$ may not be guaranteed as well, but only the first such right-hand side is

reported. If a small componentwise error is not requested `params(3) = 0.0`, then the j -th right-hand side is the first with a normwise error bound that is not guaranteed (the smallest j such that `err_bnds_norm(j,1) = 0.0` or `err_bnds_comp(j,1) = 0.0`. See the definition of `err_bnds_norm` and `err_bnds_comp` for `err = 1`. To get information about all of the right-hand sides, check `err_bnds_norm` or `err_bnds_comp`.

call zgbsv( n, kl, ku, nrhs, ab, ldab, ipiv, b, ldb, info )
call gbsv( ab, b [,kl] [,ipiv] [,info] )
```

Include Files

- `mkl.fi`, `lapack.f90`

Description

The routine solves for X the real or complex system of linear equations $A \cdot X = B$, where A is an n -by- n band matrix with kl subdiagonals and ku superdiagonals, the columns of matrix B are individual right-hand sides, and the columns of X are the corresponding solutions.

The LU decomposition with partial pivoting and row interchanges is used to factor A as $A = L \cdot U$, where L is a product of permutation and unit lower triangular matrices with kl subdiagonals, and U is upper triangular with $kl+ku$ superdiagonals. The factored form of A is then used to solve the system of equations $A \cdot X = B$.

Input Parameters

<i>n</i>	INTEGER. The order of A . The number of rows in B ; $n \geq 0$.
<i>kl</i>	INTEGER. The number of subdiagonals within the band of A ; $kl \geq 0$.
<i>ku</i>	INTEGER. The number of superdiagonals within the band of A ; $ku \geq 0$.
<i>nrhs</i>	INTEGER. The number of right-hand sides. The number of columns in B ; $nrhs \geq 0$.
<i>ab, b</i>	REAL for <code>sgbsv</code> DOUBLE PRECISION for <code>dgbsv</code> COMPLEX for <code>cgbsv</code> DOUBLE COMPLEX for <code>zgbsv</code> .

Arrays: ab (size $ldab$ by $*$), b (size ldb by $*$).

The array ab contains the matrix A in band storage (see [Matrix Storage Schemes](#)). The second dimension of ab must be at least $\max(1, n)$.

The array b contains the matrix B whose columns are the right-hand sides for the systems of equations. The second dimension of b must be at least $\max(1, nrhs)$.

ldab INTEGER. The leading dimension of the array ab . ($ldab \geq 2kl + ku + 1$)

ldb INTEGER. The leading dimension of b ; $ldb \geq \max(1, n)$.

Output Parameters

ab Overwritten by L and U . The diagonal and $kl + ku$ superdiagonals of U are stored in the first $1 + kl + ku$ rows of ab . The multipliers used to form L are stored in the next kl rows.

b Overwritten by the solution matrix X .

ipiv INTEGER.
Array, size at least $\max(1, n)$. The pivot indices: row i was interchanged with row $ipiv(i)$.

info INTEGER. If $info = 0$, the execution is successful.
If $info = -i$, the i -th parameter had an illegal value.
If $info = i$, $U(i, i)$ is exactly zero. The factorization has been completed, but the factor U is exactly singular, so the solution could not be computed.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `gbsv` interface are as follows:

ab Holds the array A of size $(2*kl+ku+1, n)$.

b Holds the matrix B of size $(n, nrhs)$.

ipiv Holds the vector of length n .

kl If omitted, assumed $kl = ku$.

ku Restored as $ku = lda - 2*kl - 1$.

call cgbsvx( fact, trans, n, kl, ku, nrhs, ab, ldab, afb, ldafb, ipiv, equed, r, c, b,
ldb, x, ldx, rcond, ferr, berr, work, rwork, info )

call zgbsvx( fact, trans, n, kl, ku, nrhs, ab, ldab, afb, ldafb, ipiv, equed, r, c, b,
ldb, x, ldx, rcond, ferr, berr, work, rwork, info )

call gbsvx( ab, b, x [,kl] [,afb] [,ipiv] [,fact] [,trans] [,equed] [,r] [,c] [,ferr]
[,berr] [,rcond] [,rpvgrw] [,info] )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine uses the LU factorization to compute the solution to a real or complex system of linear equations $A \cdot X = B$, $A^T \cdot X = B$, or $A^H \cdot X = B$, where A is a band matrix of order n with kl subdiagonals and ku superdiagonals, the columns of matrix B are individual right-hand sides, and the columns of X are the corresponding solutions.

Error bounds on the solution and a condition estimate are also provided.

The routine ?gbsvx performs the following steps:

1. If $fact = 'E'$, real scaling factors r and c are computed to equilibrate the system:

$$trans = 'N': diag(r) \cdot A \cdot diag(c) \cdot inv(diag(c)) \cdot X = diag(r) \cdot B$$

$$trans = 'T': (diag(r) \cdot A \cdot diag(c))^T \cdot inv(diag(r)) \cdot X = diag(c) \cdot B$$

$$trans = 'C': (diag(r) \cdot A \cdot diag(c))^H \cdot inv(diag(r)) \cdot X = diag(c) \cdot B$$

Whether the system will be equilibrated depends on the scaling of the matrix A , but if equilibration is used, A is overwritten by $diag(r) \cdot A \cdot diag(c)$ and B by $diag(r) \cdot B$ (if $trans = 'N'$) or $diag(c) \cdot B$ (if $trans = 'T'$ or $'C'$).

2. If $fact = 'N'$ or $'E'$, the LU decomposition is used to factor the matrix A (after equilibration if $fact = 'E'$) as $A = L \cdot U$, where L is a product of permutation and unit lower triangular matrices with kl subdiagonals, and U is upper triangular with $kl + ku$ superdiagonals.
3. If some $U_{i,i} = 0$, so that U is exactly singular, then the routine returns with $info = i$. Otherwise, the factored form of A is used to estimate the condition number of the matrix A . If the reciprocal of the condition number is less than machine precision, $info = n + 1$ is returned as a warning, but the routine still goes on to solve for X and compute error bounds as described below.
4. The system of equations is solved for X using the factored form of A .
5. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.
6. If equilibration was used, the matrix X is premultiplied by $diag(c)$ (if $trans = 'N'$) or $diag(r)$ (if $trans = 'T'$ or $'C'$) so that it solves the original system before equilibration.

Input Parameters

<i>fact</i>	<p>CHARACTER*1. Must be 'F', 'N', or 'E'.</p> <p>Specifies whether the factored form of the matrix <i>A</i> is supplied on entry, and if not, whether the matrix <i>A</i> should be equilibrated before it is factored.</p> <p>If <i>fact</i> = 'F': on entry, <i>afb</i> and <i>ipiv</i> contain the factored form of <i>A</i>. If <i>equed</i> is not 'N', the matrix <i>A</i> is equilibrated with scaling factors given by <i>r</i> and <i>c</i>. <i>ab</i>, <i>afb</i>, and <i>ipiv</i> are not modified.</p> <p>If <i>fact</i> = 'N', the matrix <i>A</i> will be copied to <i>afb</i> and factored.</p> <p>If <i>fact</i> = 'E', the matrix <i>A</i> will be equilibrated if necessary, then copied to <i>afb</i> and factored.</p>
<i>trans</i>	<p>CHARACTER*1. Must be 'N', 'T', or 'C'.</p> <p>Specifies the form of the system of equations:</p> <p>If <i>trans</i> = 'N', the system has the form $A^*X = B$ (No transpose).</p> <p>If <i>trans</i> = 'T', the system has the form $A^T X = B$ (Transpose).</p> <p>If <i>trans</i> = 'C', the system has the form $A^H X = B$ (Transpose for real flavors, conjugate transpose for complex flavors).</p>
<i>n</i>	<p>INTEGER. The number of linear equations, the order of the matrix <i>A</i>; $n \geq 0$.</p>
<i>kl</i>	<p>INTEGER. The number of subdiagonals within the band of <i>A</i>; $kl \geq 0$.</p>
<i>ku</i>	<p>INTEGER. The number of superdiagonals within the band of <i>A</i>; $ku \geq 0$.</p>
<i>nrhs</i>	<p>INTEGER. The number of right hand sides, the number of columns of the matrices <i>B</i> and <i>X</i>; $nrhs \geq 0$.</p>
<i>ab</i> , <i>afb</i> , <i>b</i> , <i>work</i>	<p>REAL for sgbsvx DOUBLE PRECISION for dgbsvx COMPLEX for cgbsvx DOUBLE COMPLEX for zgbsvx.</p> <p>Arrays: <i>ab</i>(<i>ldab</i>,*), <i>afb</i>(<i>ldafb</i>,*), <i>b</i>(size <i>ldb</i> by *), <i>work</i>(*).</p> <p>The array <i>ab</i> contains the matrix <i>A</i> in band storage (see Matrix Storage Schemes). The second dimension of <i>ab</i> must be at least $\max(1, n)$. If <i>fact</i> = 'F' and <i>equed</i> is not 'N', then <i>A</i> must have been equilibrated by the scaling factors in <i>r</i> and/or <i>c</i>.</p> <p>The array <i>afb</i> is an input argument if <i>fact</i> = 'F'. The second dimension of <i>afb</i> must be at least $\max(1, n)$. It contains the factored form of the matrix <i>A</i>, that is, the factors <i>L</i> and <i>U</i> from the factorization $A = P^* L^* U$ as computed by ?gbtrf. <i>U</i> is stored as an upper triangular band matrix with <i>kl</i> + <i>ku</i> superdiagonals in the first 1 + <i>kl</i> + <i>ku</i> rows of <i>afb</i>. The multipliers used during the factorization are stored in the next <i>kl</i> rows. If <i>equed</i> is not 'N', then <i>afb</i> is the factored form of the equilibrated matrix <i>A</i>.</p>

The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least $\max(1, nrhs)$.

work()* is a workspace array. The dimension of *work* must be at least $\max(1, 3*n)$ for real flavors, and at least $\max(1, 2*n)$ for complex flavors.

ldab

INTEGER. The leading dimension of *ab*; $ldab \geq kl + ku + 1$.

ldaafb

INTEGER. The leading dimension of *afb*; $ldaafb \geq 2*kl + ku + 1$.

ldb

INTEGER. The leading dimension of *b*; $ldb \geq \max(1, n)$.

ipiv

INTEGER.

Array, size at least $\max(1, n)$. The array *ipiv* is an input argument if *fact* = 'F'. It contains the pivot indices from the factorization $A = P*L*U$ as computed by [?gbtrf](#); row *i* of the matrix was interchanged with row *ipiv(i)*.

equed

CHARACTER*1. Must be 'N', 'R', 'C', or 'B'.

equed is an input argument if *fact* = 'F'. It specifies the form of equilibration that was done:

If *equed* = 'N', no equilibration was done (always true if *fact* = 'N').

If *equed* = 'R', row equilibration was done, that is, *A* has been premultiplied by *diag(r)*.

If *equed* = 'C', column equilibration was done, that is, *A* has been postmultiplied by *diag(c)*.

if *equed* = 'B', both row and column equilibration was done, that is, *A* has been replaced by *diag(r)*A*diag(c)*.

r, c

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Arrays: *r* (size *n*), *c* (size *n*).

The array *r* contains the row scale factors for *A*, and the array *c* contains the column scale factors for *A*. These arrays are input arguments if *fact* = 'F' only; otherwise they are output arguments.

If *equed* = 'R' or 'B', *A* is multiplied on the left by *diag(r)*; if *equed* = 'N' or 'C', *r* is not accessed.

If *fact* = 'F' and *equed* = 'R' or 'B', each element of *r* must be positive.

If *equed* = 'C' or 'B', *A* is multiplied on the right by *diag(c)*; if *equed* = 'N' or 'R', *c* is not accessed.

If *fact* = 'F' and *equed* = 'C' or 'B', each element of *c* must be positive.

<i>ldx</i>	INTEGER. The leading dimension of the output array <i>x</i> ; $ldx \geq \max(1, n)$.
<i>iwork</i>	INTEGER. Workspace array, size at least $\max(1, n)$; used in real flavors only.
<i>rwork</i>	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Workspace array, size at least $\max(1, n)$; used in complex flavors only.

Output Parameters

<i>x</i>	REAL for sgbsvx DOUBLE PRECISION for dgbsvx COMPLEX for cgbsvx DOUBLE COMPLEX for zgbsvx. Array, size <i>ldx</i> by *. If <i>info</i> = 0 or <i>info</i> = <i>n</i> +1, the array <i>x</i> contains the solution matrix <i>X</i> to the <i>original</i> system of equations. Note that <i>A</i> and <i>B</i> are modified on exit if <i>equed</i> ≠ 'N', and the solution to the <i>equilibrated</i> system is: $\text{inv}(\text{diag}(c)) * X$, if <i>trans</i> = 'N' and <i>equed</i> = 'C' or 'B'; $\text{inv}(\text{diag}(r)) * X$, if <i>trans</i> = 'T' or 'C' and <i>equed</i> = 'R' or 'B'. The second dimension of <i>x</i> must be at least $\max(1, nrhs)$.
<i>ab</i>	Array <i>ab</i> is not modified on exit if <i>fact</i> = 'F' or 'N', or if <i>fact</i> = 'E' and <i>equed</i> = 'N'. If <i>equed</i> ≠ 'N', <i>A</i> is scaled on exit as follows: <i>equed</i> = 'R': $A = \text{diag}(r) * A$ <i>equed</i> = 'C': $A = A * \text{diag}(c)$ <i>equed</i> = 'B': $A = \text{diag}(r) * A * \text{diag}(c)$.
<i>afb</i>	If <i>fact</i> = 'N' or 'E', then <i>afb</i> is an output argument and on exit returns details of the <i>LU</i> factorization of the original matrix <i>A</i> (if <i>fact</i> = 'N') or of the equilibrated matrix <i>A</i> (if <i>fact</i> = 'E'). See the description of <i>ab</i> for the form of the equilibrated matrix.
<i>b</i>	Overwritten by $\text{diag}(r) * b$ if <i>trans</i> = 'N' and <i>equed</i> = 'R' or 'B'; overwritten by $\text{diag}(c) * b$ if <i>trans</i> = 'T' or 'C' and <i>equed</i> = 'C' or 'B'; not changed if <i>equed</i> = 'N'.
<i>r, c</i>	These arrays are output arguments if <i>fact</i> ≠ 'F'. See the description of <i>r, c</i> in <i>Input Arguments</i> section.
<i>rcond</i>	REAL for single precision flavors DOUBLE PRECISION for double precision flavors.

An estimate of the reciprocal condition number of the matrix A after equilibration (if done).

If $rcond$ is less than the machine precision (in particular, if $rcond = 0$), the matrix is singular to working precision. This condition is indicated by a return code of $info > 0$.

ferr

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, size at least $\max(1, nrhs)$. Contains the estimated forward error bound for each solution vector $x(j)$ (the j -th column of the solution matrix X). If $xtrue$ is the true solution corresponding to $x(j)$, $ferr(j)$ is an estimated upper bound for the magnitude of the largest element in $(x(j) - xtrue)$ divided by the magnitude of the largest element in $x(j)$. The estimate is as reliable as the estimate for $rcond$, and is almost always a slight overestimate of the true error.

berr

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, size at least $\max(1, nrhs)$. Contains the component-wise relative backward error for each solution vector $x(j)$, that is, the smallest relative change in any element of A or B that makes $x(j)$ an exact solution.

ipiv

If $fact = 'N'$ or $'E'$, then *ipiv* is an output argument and on exit contains the pivot indices from the factorization $A = L*U$ of the original matrix A (if $fact = 'N'$) or of the equilibrated matrix A (if $fact = 'E'$).

info

INTEGER. If $info = 0$, the execution is successful.

If $info = -i$, the i -th parameter had an illegal value.

If $info = i$, and $i \leq n$, then $U(i, i)$ is exactly zero. The factorization has been completed, but the factor U is exactly singular, so the solution and error bounds could not be computed; $rcond = 0$ is returned. If $info = i$, and $i = n+1$, then U is nonsingular, but $rcond$ is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of $rcond$ would suggest.

equed

If $fact \neq 'F'$, then *equed* is an output argument. It specifies the form of equilibration that was done (see the description of *equed* in *Input Arguments* section).

work, rwork

On exit, *work*(1) for real flavors, or *rwork*(1) for complex flavors, contains the reciprocal pivot growth factor $\text{norm}(A)/\text{norm}(U)$. The "max absolute element" norm is used. If *work*(1) for real flavors, or *rwork*(1) for complex flavors is much less than 1, then the stability of the LU factorization of the (equilibrated) matrix A could be poor. This also means that the solution x , condition estimator $rcond$, and forward error bound *ferr* could be unreliable. If factorization fails with

$0 < info \leq n$, then $work(1)$ for real flavors, or $rwork(1)$ for complex flavors contains the reciprocal pivot growth factor for the leading $info$ columns of A .

info

INTEGER. If $info = 0$, the execution is successful.

If $info = -i$, the i -th parameter had an illegal value.

If $info = i$, and $i \leq n$, then $U(i, i)$ is exactly zero. The factorization has been completed, but the factor U is exactly singular, so the solution and error bounds could not be computed; $rcond = 0$ is returned. If $info = i$, and $i = n+1$, then U is nonsingular, but $rcond$ is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of $rcond$ would suggest.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `gbsvx` interface are as follows:

<i>ab</i>	Holds the array A of size $(kl+ku+1, n)$.
<i>b</i>	Holds the matrix B of size $(n, nrhs)$.
<i>x</i>	Holds the matrix X of size $(n, nrhs)$.
<i>afb</i>	Holds the array AF of size $(2*kl+ku+1, n)$.
<i>ipiv</i>	Holds the vector of length n .
<i>r</i>	Holds the vector of length n . Default value for each element is $r(i) = 1.0_WP$.
<i>c</i>	Holds the vector of length n . Default value for each element is $c(i) = 1.0_WP$.
<i>ferr</i>	Holds the vector of length $(nrhs)$.
<i>berr</i>	Holds the vector of length $(nrhs)$.
<i>trans</i>	Must be 'N', 'C', or 'T'. The default value is 'N'.
<i>equed</i>	Must be 'N', 'B', 'C', or 'R'. The default value is 'N'.
<i>fact</i>	Must be 'N', 'E', or 'F'. The default value is 'N'. If $fact = 'F'$, then both arguments <i>af</i> and <i>ipiv</i> must be present; otherwise, an error is returned.
<i>rpvgrw</i>	Real value that contains the reciprocal pivot growth factor $\text{norm}(A)/\text{norm}(U)$.

kl	If omitted, assumed $kl = ku$.
ku	Restored as $ku = lda - kl - 1$.

Description

The routine uses the LU factorization to compute the solution to a real or complex system of linear equations $A^*X = B$, $A^T X = B$, or $A^H X = B$, where A is an n -by- n banded matrix, the columns of the matrix B are individual right-hand sides, and the columns of X are the corresponding solutions.

Both normwise and maximum componentwise error bounds are also provided on request. The routine returns a solution with a small guaranteed error ($O(\text{eps})$, where eps is the working machine precision) unless the matrix is very ill-conditioned, in which case a warning is returned. Relevant condition numbers are also calculated and returned.

The routine accepts user-provided factorizations and equilibration factors; see definitions of the *fact* and *equed* options. Solving with refinement and using a factorization from a previous call of the routine also produces a solution with $O(\text{eps})$ errors or warnings but that may not be true for general user-provided factorizations and equilibration factors if they differ from what the routine would itself produce.

The routine ?gbsvxx performs the following steps:

1. If *fact* = 'E', scaling factors r and c are computed to equilibrate the system:

$$\text{trans} = \text{'N'}: \text{diag}(r) * A * \text{diag}(c) * \text{inv}(\text{diag}(c)) * X = \text{diag}(r) * B$$

$$\text{trans} = \text{'T'}: (\text{diag}(r) * A * \text{diag}(c))^T * \text{inv}(\text{diag}(r)) * X = \text{diag}(c) * B$$

$$\text{trans} = \text{'C'}: (\text{diag}(r) * A * \text{diag}(c))^H * \text{inv}(\text{diag}(r)) * X = \text{diag}(c) * B$$

Whether or not the system will be equilibrated depends on the scaling of the matrix A , but if equilibration is used, A is overwritten by $\text{diag}(r) * A * \text{diag}(c)$ and B by $\text{diag}(r) * B$ (if $\text{trans} = 'N'$) or $\text{diag}(c) * B$ (if $\text{trans} = 'T'$ or $'C'$).

2. If $\text{fact} = 'N'$ or $'E'$, the LU decomposition is used to factor the matrix A (after equilibration if $\text{fact} = 'E'$) as $A = P * L * U$, where P is a permutation matrix, L is a unit lower triangular matrix, and U is upper triangular.
3. If some $U_{i,i} = 0$, so that U is exactly singular, then the routine returns with $\text{info} = i$. Otherwise, the factored form of A is used to estimate the condition number of the matrix A (see the rcond parameter). If the reciprocal of the condition number is less than machine precision, the routine still goes on to solve for X and compute error bounds.
4. The system of equations is solved for X using the factored form of A .
5. By default, unless $\text{params}(1)$ is set to zero, the routine applies iterative refinement to improve the computed solution matrix and calculate error bounds. Refinement calculates the residual to at least twice the working precision.
6. If equilibration was used, the matrix X is premultiplied by $\text{diag}(c)$ (if $\text{trans} = 'N'$) or $\text{diag}(r)$ (if $\text{trans} = 'T'$ or $'C'$) so that it solves the original system before equilibration.

Input Parameters

<i>fact</i>	<p>CHARACTER*1. Must be 'F', 'N', or 'E'.</p> <p>Specifies whether or not the factored form of the matrix A is supplied on entry, and if not, whether the matrix A should be equilibrated before it is factored.</p> <p>If $\text{fact} = 'F'$, on entry, <i>afb</i> and <i>ipiv</i> contain the factored form of A. If <i>equed</i> is not 'N', the matrix A has been equilibrated with scaling factors given by <i>r</i> and <i>c</i>. Parameters <i>ab</i>, <i>afb</i>, and <i>ipiv</i> are not modified.</p> <p>If $\text{fact} = 'N'$, the matrix A will be copied to <i>afb</i> and factored.</p> <p>If $\text{fact} = 'E'$, the matrix A will be equilibrated, if necessary, copied to <i>afb</i> and factored.</p>
<i>trans</i>	<p>CHARACTER*1. Must be 'N', 'T', or 'C'.</p> <p>Specifies the form of the system of equations:</p> <p>If $\text{trans} = 'N'$, the system has the form $A * X = B$ (No transpose).</p> <p>If $\text{trans} = 'T'$, the system has the form $A^T * X = B$ (Transpose).</p> <p>If $\text{trans} = 'C'$, the system has the form $A^H * X = B$ (Conjugate Transpose = Transpose for real flavors, Conjugate Transpose for complex flavors).</p>
<i>n</i>	INTEGER. The number of linear equations; the order of the matrix A ; $n \geq 0$.
<i>kl</i>	INTEGER. The number of subdiagonals within the band of A ; $kl \geq 0$.
<i>ku</i>	INTEGER. The number of superdiagonals within the band of A ; $ku \geq 0$.
<i>nrhs</i>	INTEGER. The number of right-hand sides; the number of columns of the matrices B and X ; $nrhs \geq 0$.
<i>ab</i> , <i>afb</i> , <i>b</i> , <i>work</i>	<p>REAL for <i>sgbsvxx</i></p> <p>DOUBLE PRECISION for <i>dgbvsvxx</i></p> <p>COMPLEX for <i>cgbvsvxx</i></p>

DOUBLE COMPLEX for zgbsvxx.

Arrays: $ab(ldab, *)$, $afb(ldafb, *)$, $b(\text{size } ldb \text{ by } *)$, $work(*)$.

The array ab contains the matrix A in band storage, in rows 1 to $kl+ku+1$. The j -th column of A is stored in the j -th column of the array ab as follows:

$ab(ku+1+i-j, j) = A(i, j)$ for $\max(1, j-ku) \leq i \leq \min(n, j+kl)$.

If $fact = 'F'$ and $equed$ is not 'N', then AB must have been equilibrated by the scaling factors in r and/or c . The second dimension of a must be at least $\max(1, n)$.

The array afb is an input argument if $fact = 'F'$. It contains the factored form of the banded matrix A , that is, the factors L and U from the factorization $A = P*L*U$ as computed by `?gbtrf`. U is stored as an upper triangular banded matrix with $kl + ku$ superdiagonals in rows 1 to $kl + ku + 1$. The multipliers used during the factorization are stored in rows $kl + ku + 2$ to $2*kl + ku + 1$. If $equed$ is not 'N', then afb is the factored form of the equilibrated matrix A .

The array b contains the matrix B whose columns are the right-hand sides for the systems of equations. The second dimension of b must be at least $\max(1, nrhs)$.

$work(*)$ is a workspace array. The dimension of $work$ must be at least $\max(1, 4*n)$ for real flavors, and at least $\max(1, 2*n)$ for complex flavors.

$ldab$

INTEGER. The leading dimension of the array ab ; $ldab \geq kl+ku+1$.

$ldafb$

INTEGER. The leading dimension of the array afb ; $ldafb \geq 2*kl+ku+1$.

$ipiv$

INTEGER.

Array, size at least $\max(1, n)$. The array $ipiv$ is an input argument if $fact = 'F'$. It contains the pivot indices from the factorization $A = P*L*U$ as computed by `?gbtrf`; row i of the matrix was interchanged with row $ipiv(i)$.

$equed$

CHARACTER*1. Must be 'N', 'R', 'C', or 'B'.

$equed$ is an input argument if $fact = 'F'$. It specifies the form of equilibration that was done:

If $equed = 'N'$, no equilibration was done (always true if $fact = 'N'$).

If $equed = 'R'$, row equilibration was done, that is, A has been premultiplied by $diag(r)$.

If $equed = 'C'$, column equilibration was done, that is, A has been postmultiplied by $diag(c)$.

If $equed = 'B'$, both row and column equilibration was done, that is, A has been replaced by $diag(r)*A*diag(c)$.

r, c

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Arrays: r (size n), c (size n). The array r contains the row scale factors for A , and the array c contains the column scale factors for A . These arrays are input arguments if $fact = 'F'$ only; otherwise they are output arguments.

If *equed* = 'R' or 'B', *A* is multiplied on the left by *diag*(*r*); if *equed* = 'N' or 'C', *r* is not accessed.

If *fact* = 'F' and *equed* = 'R' or 'B', each element of *r* must be positive.

If *equed* = 'C' or 'B', *A* is multiplied on the right by *diag*(*c*); if *equed* = 'N' or 'R', *c* is not accessed.

If *fact* = 'F' and *equed* = 'C' or 'B', each element of *c* must be positive.

Each element of *r* or *c* should be a power of the radix to ensure a reliable solution and error estimates. Scaling by powers of the radix does not cause rounding errors unless the result underflows or overflows. Rounding errors during scaling lead to refining with a matrix that is not equivalent to the input matrix, producing error estimates that may not be reliable.

ldb INTEGER. The leading dimension of the array *b*; $ldb \geq \max(1, n)$.

ldx INTEGER. The leading dimension of the output array *x*; $ldx \geq \max(1, n)$.

n_err_bnds INTEGER. Number of error bounds to return for each right hand side and each type (normwise or componentwise). See *err_bnds_norm* and *err_bnds_comp* descriptions in *Output Arguments* section below.

nparams INTEGER. Specifies the number of parameters set in *params*. If ≤ 0 , the *params* array is never referenced and default values are used.

params REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, size *nparams*. Specifies algorithm parameters. If an entry is less than 0.0, that entry is filled with the default value used for that parameter. Only positions up to *nparams* are accessed; defaults are used for higher-numbered parameters. If defaults are acceptable, you can pass *nparams* = 0, which prevents the source code from accessing the *params* argument.

params(1) : Whether to perform iterative refinement or not. Default: 1.0 (for single precision flavors), 1.0D+0 (for double precision flavors).

=0.0 No refinement is performed and no error bounds are computed.

=1.0 Use the extra-precise refinement algorithm.

(Other values are reserved for future use.)

params(2) : Maximum number of residual computations allowed for refinement.

Default 10.0

Aggressive Set to 100.0 to permit convergence using approximate factorizations or factorizations other than *LU*. If the factorization uses a

technique other than Gaussian elimination, the guarantees in *err_bnds_norm* and *err_bnds_comp* may no longer be trustworthy.

params(3) : Flag determining if the code will attempt to find a solution with a small componentwise relative error in the double-precision algorithm. Positive is true, 0.0 is false. Default: 1.0 (attempt componentwise convergence).

iwork INTEGER. Workspace array, size at least $\max(1, n)$; used in real flavors only.

rwork REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Workspace array, size at least $\max(1, 2*n)$; used in complex flavors only.

Output Parameters

x REAL for *sghsvxx*
DOUBLE PRECISION for *dghsvxx*
COMPLEX for *cghsvxx*
DOUBLE COMPLEX for *zghsvxx*.
Array, size *ldx* by *.
If *info* = 0, the array *x* contains the solution *n*-by-*nrhs* matrix *X* to the *original* system of equations. Note that *A* and *B* are modified on exit if *equed* ≠ 'N', and the solution to the *equilibrated* system is:
 $\text{inv}(\text{diag}(c)) * X$, if *trans* = 'N' and *equed* = 'C' or 'B'; or
 $\text{inv}(\text{diag}(r)) * X$, if *trans* = 'T' or 'C' and *equed* = 'R' or 'B'. The second dimension of *x* must be at least $\max(1, nrhs)$.

ab Array *ab* is not modified on exit if *fact* = 'F' or 'N', or if *fact* = 'E' and *equed* = 'N'.

If *equed* ≠ 'N', *A* is scaled on exit as follows:

equed = 'R': $A = \text{diag}(r) * A$

equed = 'C': $A = A * \text{diag}(c)$

equed = 'B': $A = \text{diag}(r) * A * \text{diag}(c)$.

afb If *fact* = 'N' or 'E', then *afb* is an output argument and on exit returns the factors *L* and *U* from the factorization $A = PLU$ of the original matrix *A* (if *fact* = 'N') or of the equilibrated matrix *A* (if *fact* = 'E').

b Overwritten by $\text{diag}(r) * B$ if *trans* = 'N' and *equed* = 'R' or 'B';
overwritten by *trans* = 'T' or 'C' and *equed* = 'C' or 'B';
not changed if *equed* = 'N'.

r, c	These arrays are output arguments if <i>fact</i> ≠ 'F'. Each element of these arrays is a power of the radix. See the description of r, c in <i>Input Arguments</i> section.
$rcond$	<p>REAL for single precision flavors</p> <p>DOUBLE PRECISION for double precision flavors.</p> <p>Reciprocal scaled condition number. An estimate of the reciprocal Skeel condition number of the matrix A after equilibration (if done). If $rcond$ is less than the machine precision, in particular, if $rcond = 0$, the matrix is singular to working precision. Note that the error may still be small even if this number is very small and the matrix appears ill-conditioned.</p>
$rpvgrw$	<p>REAL for single precision flavors</p> <p>DOUBLE PRECISION for double precision flavors.</p> <p>Contains the reciprocal pivot growth factor:</p> $\ A\ /\ U\ $ <p>If this is much less than 1, the stability of the LU factorization of the (equilibrated) matrix A could be poor. This also means that the solution X, estimated condition numbers, and error bounds could be unreliable. If factorization fails with $0 < info \leq n$, this parameter contains the reciprocal pivot growth factor for the leading $info$ columns of A. In ?gbsvx, this quantity is returned in $work(1)$.</p>
$berr$	<p>REAL for single precision flavors</p> <p>DOUBLE PRECISION for double precision flavors.</p> <p>Array, size at least $\max(1, nrhs)$. Contains the componentwise relative backward error for each solution vector $x(j)$, that is, the smallest relative change in any element of A or B that makes $x(j)$ an exact solution.</p>
err_bnds_norm	<p>REAL for single precision flavors</p> <p>DOUBLE PRECISION for double precision flavors.</p> <p>Array of size $nrhs$ by n_err_bnds. For each right-hand side, contains information about various error bounds and condition numbers corresponding to the normwise relative error, which is defined as follows:</p> <p>Normwise relative error in the i-th solution vector</p> $\frac{\max_j X_{true_{ji}} - X_{ji} }{\max_j X_{ji} }$ <p>The array is indexed by the type of error information as described below. There are currently up to three pieces of information returned.</p> <p>The first index in $err_bnds_norm(i, :)$ corresponds to the i-th right-hand side.</p> <p>The second index in $err_bnds_norm(:, err)$ contains the following three fields:</p>

<code>err=1</code>	"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold $\sqrt{n} * \text{slamch}(\epsilon)$ for single precision flavors and $\sqrt{n} * \text{dlamch}(\epsilon)$ for double precision flavors.
<code>err=2</code>	"Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold $\sqrt{n} * \text{slamch}(\epsilon)$ for single precision flavors and $\sqrt{n} * \text{dlamch}(\epsilon)$ for double precision flavors. This error bound should only be trusted if the previous boolean is true.
<code>err=3</code>	Reciprocal condition number. Estimated normwise reciprocal condition number. Compared with the threshold $\sqrt{n} * \text{slamch}(\epsilon)$ for single precision flavors and $\sqrt{n} * \text{dlamch}(\epsilon)$ for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix Z are: $\ Z\ _{\infty} \cdot \ Z^{-1}\ _{\infty}$ <p>Let $z=s*a$, where s scales each row by a power of the radix so all absolute row sums of z are approximately 1.</p>

`err_bnds_comp`

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array of size `nrhs` by `n_err_bnds`. For each right-hand side, contains information about various error bounds and condition numbers corresponding to the componentwise relative error, which is defined as follows:

Componentwise relative error in the i -th solution vector:

$$\max_j \frac{|X_{true_{ji}} - X_{ji}|}{|X_{ji}|}$$

The array is indexed by the right-hand side i , on which the componentwise relative error depends, and by the type of error information as described below. There are currently up to three pieces of information returned for each right-hand side. If componentwise accuracy is not requested (`params(3) = 0.0`), then `err_bnds_comp` is not accessed. If `n_err_bnds < 3`, then at most the first `(:,n_err_bnds)` entries are returned.

The first index in `err_bnds_comp(i,:)` corresponds to the i -th right-hand side.

The second index in `err_bnds_comp(:,err)` contains the following three fields:

<code>err=1</code>	"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold $\sqrt{n} * \text{slamch}(\epsilon)$ for single precision flavors and $\sqrt{n} * \text{dlamch}(\epsilon)$ for double precision flavors.
<code>err=2</code>	"Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold $\sqrt{n} * \text{slamch}(\epsilon)$ for single precision flavors and $\sqrt{n} * \text{dlamch}(\epsilon)$ for double precision flavors. This error bound should only be trusted if the previous boolean is true.
<code>err=3</code>	Reciprocal condition number. Estimated componentwise reciprocal condition number. Compared with the threshold $\sqrt{n} * \text{slamch}(\epsilon)$ for single precision flavors and $\sqrt{n} * \text{dlamch}(\epsilon)$ for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix Z are:

$$\|Z\|_{\infty} \cdot \|Z^{-1}\|_{\infty}$$

Let $z = s * (a * \text{diag}(x))$, where x is the solution for the current right-hand side and s scales each row of $a * \text{diag}(x)$ by a power of the radix so all absolute row sums of z are approximately 1.

<code>ipiv</code>	If <code>fact = 'N'</code> or <code>'E'</code> , then <code>ipiv</code> is an output argument and on exit contains the pivot indices from the factorization $A = P * L * U$ of the original matrix A (if <code>fact = 'N'</code>) or of the equilibrated matrix A (if <code>fact = 'E'</code>).
<code>equed</code>	If <code>fact ≠ 'F'</code> , then <code>equed</code> is an output argument. It specifies the form of equilibration that was done (see the description of <code>equed</code> in <i>Input Arguments</i> section).
<code>params</code>	If an entry is less than 0.0, that entry is filled with the default value used for that parameter, otherwise the entry is not modified.
<code>info</code>	INTEGER. If <code>info = 0</code> , the execution is successful. The solution to every right-hand side is guaranteed. If <code>info = -i</code> , the i -th parameter had an illegal value. If $0 < \text{info} \leq n$: $U_{\text{info}, \text{info}}$ is exactly zero. The factorization has been completed, but the factor U is exactly singular, so the solution and error bounds could not be computed; <code>rcond = 0</code> is returned.

If $info = n+j$: The solution corresponding to the j -th right-hand side is not guaranteed. The solutions corresponding to other right-hand sides k with $k > j$ may not be guaranteed as well, but only the first such right-hand side is reported. If a small componentwise error is not requested $params(3) = 0.0$, then the j -th right-hand side is the first with a normwise error bound that is not guaranteed (the smallest j such that $err_bnds_norm(j,1) = 0.0$ or $err_bnds_comp(j,1) = 0.0$. See the definition of err_bnds_norm and err_bnds_comp for $err = 1$. To get information about all of the right-hand sides, check err_bnds_norm or err_bnds_comp .

Description

The routine solves for X the system of linear equations $A * X = B$, where A is an n -by- n tridiagonal matrix, the columns of matrix B are individual right-hand sides, and the columns of X are the corresponding solutions. The routine uses Gaussian elimination with partial pivoting.

Note that the equation $A^T * X = B$ may be solved by interchanging the order of the arguments du and dl .

Input Parameters

n	INTEGER. The order of A , the number of rows in B ; $n \geq 0$.
$nrhs$	INTEGER. The number of right-hand sides, the number of columns in B ; $nrhs \geq 0$.
dl	REAL for sgtsv DOUBLE PRECISION for dgtsv COMPLEX for cgtsv DOUBLE COMPLEX for zgtsv. The array dl (size $n - 1$) contains the $(n - 1)$ subdiagonal elements of A .

<i>d</i>	<p>REAL for sgtsv</p> <p>DOUBLE PRECISION for dgtsv</p> <p>COMPLEX for cgtsv</p> <p>DOUBLE COMPLEX for zgtsv.</p> <p>The array <i>d</i> (size <i>n</i>) contains the diagonal elements of <i>A</i>.</p>

<i>b</i>	Overwritten by the solution matrix <i>X</i> .
<i>info</i>	<p>INTEGER. If <i>info</i> = 0, the execution is successful.</p> <p>If <i>info</i> = -<i>i</i>, the <i>i</i>-th parameter had an illegal value.</p> <p>If <i>info</i> = <i>i</i>, <i>U</i>(<i>i</i>, <i>i</i>) is exactly zero, and the solution has not been computed. The factorization has not been completed unless <i>i</i> = <i>n</i>.</p>

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine *gtsv* interface are as follows:

<i>dl</i>	Holds the vector of length (<i>n</i> -1).
-----------	--

d	Holds the vector of length n .
dl	Holds the vector of length $(n-1)$.
b	Holds the matrix B of size $(n, nrhs)$.

Description

The routine uses the LU factorization to compute the solution to a real or complex system of linear equations $A^*X = B$, $A^T X = B$, or $A^H X = B$, where A is a tridiagonal matrix of order n , the columns of matrix B are individual right-hand sides, and the columns of X are the corresponding solutions.

Error bounds on the solution and a condition estimate are also provided.

The routine ?gtsvx performs the following steps:

1. If $fact = 'N'$, the LU decomposition is used to factor the matrix A as $A = L^*U$, where L is a product of permutation and unit lower bidiagonal matrices and U is an upper triangular matrix with nonzeros in only the main diagonal and first two superdiagonals.
2. If some $U_{i,i} = 0$, so that U is exactly singular, then the routine returns with $info = i$. Otherwise, the factored form of A is used to estimate the condition number of the matrix A . If the reciprocal of the condition number is less than machine precision, $info = n + 1$ is returned as a warning, but the routine still goes on to solve for X and compute error bounds as described below.
3. The system of equations is solved for X using the factored form of A .
4. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.

Input Parameters

<i>fact</i>	<p>CHARACTER*1. Must be 'F' or 'N'.</p> <p>Specifies whether or not the factored form of the matrix A has been supplied on entry.</p> <p>If <i>fact</i> = 'F': on entry, <i>dlf</i>, <i>df</i>, <i>duf</i>, <i>du2</i>, and <i>ipiv</i> contain the factored form of A; arrays <i>dl</i>, <i>d</i>, <i>du</i>, <i>dlf</i>, <i>df</i>, <i>duf</i>, <i>du2</i>, and <i>ipiv</i> will not be modified.</p> <p>If <i>fact</i> = 'N', the matrix A will be copied to <i>dlf</i>, <i>df</i>, and <i>duf</i> and factored.</p>
<i>trans</i>	<p>CHARACTER*1. If <i>fact</i> = 'F', then <i>df</i> is an input argument and on entry contains the n diagonal elements of the upper triangular matrix U from the LU factorization of A.</p> <p><i>duf</i>, size $(n-1)$. If <i>fact</i> = 'F', then <i>duf</i> is an input argument and on entry contains the $(n-1)$ elements of the first superdiagonal of U.</p> <p><i>du2</i>, size $(n-2)$. If <i>fact</i> = 'F', then <i>du2</i> is an input argument and on entry contains the $(n-2)$ elements of the second superdiagonal of U.</p> <p><i>b</i>(<i>ldb</i>, *) contains the right-hand side matrix B. The second dimension of <i>b</i> must be at least $\max(1, nrhs)$.</p>

work(*) is a workspace array. The size of *work* must be at least $\max(1, 3*n)$ for real flavors and $\max(1, 2*n)$ for complex flavors.

ldb INTEGER. The leading dimension of *b*; $ldb \geq \max(1, n)$.

ldx INTEGER. The leading dimension of *x*; $ldx \geq \max(1, n)$.

ipiv INTEGER.

Array, size at least $\max(1, n)$. If *fact* = 'F', then *ipiv* is an input argument and on entry contains the pivot indices, as returned by [?gttrf](#).

iwork INTEGER. Workspace array, size (*n*). Used for real flavors only.

rwork REAL for *cgtsvx*

DOUBLE PRECISION for *zgtsvx*.

Workspace array, size (*n*). Used for complex flavors only.

Output Parameters

x REAL for *sgtsvx*

DOUBLE PRECISION for *dgtsvx*

COMPLEX for *cgtsvx*

DOUBLE COMPLEX for *zgtsvx*.

Array, size *ldx* by *.

If *info* = 0 or *info* = *n*+1, the array *x* contains the solution matrix *X*. The second dimension of *x* must be at least $\max(1, nrhs)$.

dlf If *fact* = 'N', then *dlf* is an output argument and on exit contains the (*n*-1) multipliers that define the matrix *L* from the *LU* factorization of *A*.

df If *fact* = 'N', then *df* is an output argument and on exit contains the *n* diagonal elements of the upper triangular matrix *U* from the *LU* factorization of *A*.

duf If *fact* = 'N', then *duf* is an output argument and on exit contains the (*n*-1) elements of the first superdiagonal of *U*.

du2 If *fact* = 'N', then *du2* is an output argument and on exit contains the (*n*-2) elements of the second superdiagonal of *U*.

ipiv The array *ipiv* is an output argument if *fact* = 'N' and, on exit, contains the pivot indices from the factorization $A = L*U$; row *i* of the matrix was interchanged with row *ipiv*(*i*). The value of *ipiv*(*i*) will always be *i* or *i*+1; *ipiv*(*i*)=*i* indicates a row interchange was not required.

rcond REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

An estimate of the reciprocal condition number of the matrix A . If $rcond$ is less than the machine precision (in particular, if $rcond = 0$), the matrix is singular to working precision. This condition is indicated by a return code of $info > 0$.

ferr

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, size at least $\max(1, nrhs)$. Contains the estimated forward error bound for each solution vector $x(j)$ (the j -th column of the solution matrix X). If $xtrue$ is the true solution corresponding to $x(j)$, $ferr(j)$ is an estimated upper bound for the magnitude of the largest element in $(x(j) - xtrue)$ divided by the magnitude of the largest element in $x(j)$. The estimate is as reliable as the estimate for $rcond$, and is almost always a slight overestimate of the true error.

berr

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, size at least $\max(1, nrhs)$. Contains the component-wise relative backward error for each solution vector $x(j)$, that is, the smallest relative change in any element of A or B that makes $x(j)$ an exact solution.

info

INTEGER. If $info = 0$, the execution is successful.

If $info = -i$, the i -th parameter had an illegal value.

If $info = i$, and $i \leq n$, then $U(i, i)$ is exactly zero. The factorization has not been completed unless $i = n$, but the factor U is exactly singular, so the solution and error bounds could not be computed; $rcond = 0$ is returned. If $info = i$, and $i = n + 1$, then U is nonsingular, but $rcond$ is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of $rcond$ would suggest.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `gtsvx` interface are as follows:

<i>dl</i>	Holds the vector of length $(n-1)$.
<i>d</i>	Holds the vector of length n .
<i>du</i>	Holds the vector of length $(n-1)$.
<i>b</i>	Holds the matrix B of size $(n, nrhs)$.
<i>x</i>	Holds the matrix X of size $(n, nrhs)$.

<i>dlf</i>	Holds the vector of length $(n-1)$.
<i>df</i>	Holds the vector of length n .
<i>duf</i>	Holds the vector of length $(n-1)$.
<i>du2</i>	Holds the vector of length $(n-2)$.
<i>ipiv</i>	Holds the vector of length n .
<i>ferr</i>	Holds the vector of length $(nrhs)$.
<i>berr</i>	Holds the vector of length $(nrhs)$.
<i>fact</i>	Must be 'N' or 'F'. The default value is 'N'. If <i>fact</i> = 'F', then the arguments <i>dlf</i> , <i>df</i> , <i>duf</i> , <i>du2</i> , and <i>ipiv</i> must be present; otherwise, an error is returned.
<i>trans</i>	Must be 'N', 'C', or 'T'. The default value is 'N'.

Matrix Storage Schemes

?dtsvb

Computes the solution to the system of linear equations with a diagonally dominant tridiagonal coefficient matrix A and multiple right-hand sides.

Syntax

```
call sdtsvb( n, nrhs, dl, d, du, b, ldb, info )
call ddtsvb( n, nrhs, dl, d, du, b, ldb, info )
call cdtsvb( n, nrhs, dl, d, du, b, ldb, info )
call zdtsvb( n, nrhs, dl, d, du, b, ldb, info )
call dtsvb( dl, d, du, b [, info])
```

Include Files

- mkl.fi, lapack.f90

Description

The ?dtsvb routine solves a system of linear equations $A^*X = B$ for X , where A is an n -by- n diagonally dominant tridiagonal matrix, the columns of matrix B are individual right-hand sides, and the columns of X are the corresponding solutions. The routine uses the BABE (Burning At Both Ends) algorithm.

Note that the equation $A^{T*}X = B$ may be solved by interchanging the order of the arguments *du* and *dl*.

Input Parameters

<i>n</i>	INTEGER. The order of A , the number of rows in B ; $n \geq 0$.
<i>nrhs</i>	INTEGER. The number of right-hand sides, the number of columns in B ; $nrhs \geq 0$.

dl, d, du, b REAL for `sdtsvb`DOUBLE PRECISION for `ddtsvb`COMPLEX for `cdtsvb`DOUBLE COMPLEX for `zdtsvb`.Arrays: dl (size $n - 1$), d (size n), du (size $n - 1$), b (size $ldb, *$).The array dl contains the $(n - 1)$ subdiagonal elements of A .The array d contains the diagonal elements of A .The array du contains the $(n - 1)$ superdiagonal elements of A .The array b contains the matrix B whose columns are the right-hand sides for the systems of equations. The second dimension of b must be at least $\max(1, nrhs)$. ldb INTEGER. The leading dimension of b ; $ldb \geq \max(1, n)$.

Output Parameters

 dl Overwritten by the $(n-1)$ elements of the subdiagonal of the lower triangular matrices L_1, L_2 from the factorization of A (see [dttrfb](#)). d Overwritten by the n diagonal element reciprocals of U . b Overwritten by the solution matrix X . $info$ INTEGER. If $info = 0$, the execution is successful.If $info = -i$, the i -th parameter had an illegal value.If $info = i$, u_{ii} is exactly zero, and the solution has not been computed. The factorization has not been completed unless $i = n$.

Application Notes

A diagonally dominant tridiagonal system is defined such that $|d_i| > |dl_{i-1}| + |du_i|$ for any i : $1 < i < n$, and $|d_1| > |du_1|$, $|d_n| > |dl_{n-1}|$

The underlying BABE algorithm is designed for diagonally dominant systems. Such systems have no numerical stability issue unlike the canonical systems that use elimination with partial pivoting (see [?gtsv](#)). The diagonally dominant systems are much faster than the canonical systems.

NOTE

- The current implementation of BABE has a potential accuracy issue on very small or large data close to the underflow or overflow threshold respectively. Scale the matrix before applying the solver in the case of such input data.
- Applying the `?dtsvb` factorization to non-diagonally dominant systems may lead to an accuracy loss, or false singularity detected due to no pivoting.

?posv

Computes the solution to the system of linear equations with a symmetric or Hermitian positive-definite coefficient matrix A and multiple right-hand sides.

Syntax

```
call sposv( uplo, n, nrhs, a, lda, b, ldb, info )
call dposv( uplo, n, nrhs, a, lda, b, ldb, info )
call cposv( uplo, n, nrhs, a, lda, b, ldb, info )
call zposv( uplo, n, nrhs, a, lda, b, ldb, info )
call dsposv( uplo, n, nrhs, a, lda, b, ldb, x, ldx, work, swork, iter, info )
call zcposv( uplo, n, nrhs, a, lda, b, ldb, x, ldx, work, swork, rwork, iter, info )
call posv( a, b [,uplo] [,info] )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine solves for X the real or complex system of linear equations $A * X = B$, where A is an n -by- n symmetric/Hermitian positive-definite matrix, the columns of matrix B are individual right-hand sides, and the columns of X are the corresponding solutions.

The Cholesky decomposition is used to factor A as

$A = U^T * U$ (real flavors) and $A = U^H * U$ (complex flavors), if $uplo = 'U'$

or $A = L * L^T$ (real flavors) and $A = L * L^H$ (complex flavors), if $uplo = 'L'$,

where U is an upper triangular matrix and L is a lower triangular matrix. The factored form of A is then used to solve the system of equations $A * X = B$.

The `dsposv` and `zcposv` are mixed precision iterative refinement subroutines for exploiting fast single precision hardware. They first attempt to factorize the matrix in single precision (`dsposv`) or single complex precision (`zcposv`) and use this factorization within an iterative refinement procedure to produce a solution with double precision (`dsposv`) / double complex precision (`zcposv`) normwise backward error quality (see below). If the approach fails, the method switches to a double precision or double complex precision factorization respectively and computes the solution.

The iterative refinement is not going to be a winning strategy if the ratio single precision/complex performance over double precision/double complex performance is too small. A reasonable strategy should take the number of right-hand sides and the size of the matrix into account. This might be done with a call to `ilaenv` in the future. At present, iterative refinement is implemented.

The iterative refinement process is stopped if

`iter > itermax`

or for all the right-hand sides:

`rnmr < sqrt(n) * xnmr * anrm * eps * bwdmax,`

where

- `iter` is the number of the current iteration in the iterative refinement process
- `rnmr` is the infinity-norm of the residual
- `xnmr` is the infinity-norm of the solution

- `anrm` is the infinity-operator-norm of the matrix A
- `eps` is the machine epsilon returned by `dlamch` ('Epsilon').

The values `itermax` and `bwdmax` are fixed to 30 and 1.0d+00 respectively.

Input Parameters

<code>uplo</code>	<p>CHARACTER*1. Must be 'U' or 'L'.</p> <p>Indicates whether the upper or lower triangular part of A is stored: If <code>uplo</code> = 'U', the upper triangle of A is stored. If <code>uplo</code> = 'L', the lower triangle of A is stored.</p>
<code>n</code>	<p>INTEGER. The order of matrix A; $n \geq 0$.</p>
<code>nrhs</code>	<p>INTEGER. The number of right-hand sides, the number of columns in B; $nrhs \geq 0$.</p>
<code>a, b</code>	<p>REAL for <code>sposv</code> DOUBLE PRECISION for <code>dposv</code> and <code>dsposv</code>. COMPLEX for <code>cposv</code> DOUBLE COMPLEX for <code>zposv</code> and <code>zcposv</code>.</p> <p>Arrays: <code>a(size lda,*)</code>, <code>b(ldb,*)</code>. The array <code>a</code> contains the upper or the lower triangular part of the matrix A (see <code>uplo</code>). The second dimension of <code>a</code> must be at least $\max(1, n)$.</p> <p>Note that in the case of <code>zcposv</code> the imaginary parts of the diagonal elements need not be set and are assumed to be zero.</p> <p>The array <code>b</code> contains the matrix B whose columns are the right-hand sides for the systems of equations. The second dimension of <code>b</code> must be at least $\max(1, nrhs)$.</p>
<code>lda</code>	<p>INTEGER. The leading dimension of <code>a</code>; $lda \geq \max(1, n)$.</p>
<code>ldb</code>	<p>INTEGER. The leading dimension of <code>b</code>; $ldb \geq \max(1, n)$.</p>
<code>ldx</code>	<p>INTEGER. The leading dimension of the array <code>x</code>; $ldx \geq \max(1, n)$.</p>
<code>work</code>	<p>DOUBLE PRECISION for <code>dsposv</code> DOUBLE COMPLEX for <code>zcposv</code>.</p> <p>Workspace array, size $(n*nrhs)$. This array is used to hold the residual vectors.</p>
<code>swork</code>	<p>REAL for <code>dsgeev</code> COMPLEX for <code>zcgesev</code>.</p> <p>Workspace array, size $(n*(n+nrhs))$. This array is used to use the single precision matrix and the right-hand sides or solutions in single precision.</p>
<code>rwork</code>	<p>DOUBLE PRECISION. Workspace array, size (n).</p>

Output Parameters

<i>a</i>	<p>If <i>info</i> = 0, the upper or lower triangular part of <i>a</i> is overwritten by the Cholesky factor <i>U</i> or <i>L</i>, as specified by <i>uplo</i>.</p> <p>If iterative refinement has been successfully used (<i>info</i>= 0 and <i>iter</i>≥ 0), then <i>A</i> is unchanged.</p> <p>If double precision factorization has been used (<i>info</i>= 0 and <i>iter</i> < 0), then the array <i>A</i> contains the factors <i>L</i> or <i>U</i> from the Cholesky factorization.</p>
<i>b</i>	Overwritten by the solution matrix <i>X</i> .
<i>ipiv</i>	<p>INTEGER.</p> <p>Array, size at least $\max(1, n)$. The pivot indices that define the permutation matrix <i>P</i>; row <i>i</i> of the matrix was interchanged with row <i>ipiv</i>(<i>i</i>). Corresponds to the single precision factorization (if <i>info</i>= 0 and <i>iter</i>≥ 0) or the double precision factorization (if <i>info</i>= 0 and <i>iter</i> < 0).</p>
<i>x</i>	<p>DOUBLE PRECISION for <i>dsposv</i></p> <p>DOUBLE COMPLEX for <i>zcposv</i>.</p> <p>Array, size <i>ldx</i> by <i>nrhs</i>. If <i>info</i> = 0, contains the <i>n</i>-by-<i>nrhs</i> solution matrix <i>X</i>.</p>
<i>iter</i>	<p>INTEGER.</p> <p>If <i>iter</i> < 0: iterative refinement has failed, double precision factorization has been performed</p> <ul style="list-style-type: none"> • If <i>iter</i> = -1: the routine fell back to full precision for implementation- or machine-specific reason • If <i>iter</i> = -2: narrowing the precision induced an overflow, the routine fell back to full precision • If <i>iter</i> = -3: failure of <i>spotrf</i> for <i>dsposv</i>, or <i>cpotrf</i> for <i>zcposv</i> • If <i>iter</i> = -31: stop the iterative refinement after the 30th iteration. <p>If <i>iter</i> > 0: iterative refinement has been successfully used. Returns the number of iterations.</p>
<i>info</i>	<p>INTEGER. If <i>info</i> = 0, the execution is successful.</p> <p>If <i>info</i> = -<i>i</i>, the <i>i</i>-th parameter had an illegal value.</p> <p>If <i>info</i> = <i>i</i>, the leading minor of order <i>i</i> (and therefore the matrix <i>A</i> itself) is not positive definite, so the factorization could not be completed, and the solution has not been computed.</p>

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine *posv* interface are as follows:

<i>a</i>	Holds the matrix <i>A</i> of size (n, n) .
<i>b</i>	Holds the matrix <i>B</i> of size $(n, nrhs)$.
<i>uplo</i>	Must be 'U' or 'L'. The default value is 'U'.

Include Files

- mkl.fi, lapack.f90

Description

The routine uses the *Cholesky* factorization $A=U^T*U$ (real flavors) / $A=U^H*U$ (complex flavors) or $A=L*L^T$ (real flavors) / $A=L*L^H$ (complex flavors) to compute the solution to a real or complex system of linear equations $A*X = B$, where *A* is a *n*-by-*n* real symmetric/Hermitian positive definite matrix, the columns of matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.

Error bounds on the solution and a condition estimate are also provided.

The routine ?posvx performs the following steps:

1. If *fact* = 'E', real scaling factors *s* are computed to equilibrate the system:

$$\text{diag}(s)*A*\text{diag}(s)*\text{inv}(\text{diag}(s))*X = \text{diag}(s)*B.$$

Whether or not the system will be equilibrated depends on the scaling of the matrix *A*, but if equilibration is used, *A* is overwritten by $\text{diag}(s)*A*\text{diag}(s)$ and *B* by $\text{diag}(s)*B$.

2. If *fact* = 'N' or 'E', the Cholesky decomposition is used to factor the matrix *A* (after equilibration if *fact* = 'E') as

$$A = U^T*U \text{ (real)}, A = U^H*U \text{ (complex)}, \text{ if } uplo = 'U',$$

$$\text{or } A = L*L^T \text{ (real)}, A = L*L^H \text{ (complex)}, \text{ if } uplo = 'L',$$

where *U* is an upper triangular matrix and *L* is a lower triangular matrix.

3. If the leading i -by- i principal minor is not positive-definite, then the routine returns with $info = i$. Otherwise, the factored form of A is used to estimate the condition number of the matrix A . If the reciprocal of the condition number is less than machine precision, $info = n + 1$ is returned as a warning, but the routine still goes on to solve for X and compute error bounds as described below.
4. The system of equations is solved for X using the factored form of A .
5. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.
6. If equilibration was used, the matrix X is premultiplied by $diag(s)$ so that it solves the original system before equilibration.

Input Parameters

<i>fact</i>	<p>CHARACTER*1. Must be 'F', 'N', or 'E'.</p> <p>Specifies whether or not the factored form of the matrix A is supplied on entry, and if not, whether the matrix A should be equilibrated before it is factored.</p> <p>If <i>fact</i> = 'F': on entry, <i>af</i> contains the factored form of A. If <i>equed</i> = 'Y', the matrix A has been equilibrated with scaling factors given by <i>s</i>. <i>a</i> and <i>af</i> will not be modified.</p> <p>If <i>fact</i> = 'N', the matrix A will be copied to <i>af</i> and factored.</p> <p>If <i>fact</i> = 'E', the matrix A will be equilibrated if necessary, then copied to <i>af</i> and factored.</p>
<i>uplo</i>	<p>CHARACTER*1. Must be 'U' or 'L'.</p> <p>Indicates whether the upper or lower triangular part of A is stored:</p> <p>If <i>uplo</i> = 'U', the upper triangle of A is stored.</p> <p>If <i>uplo</i> = 'L', the lower triangle of A is stored.</p>
<i>n</i>	<p>INTEGER. The order of matrix A; $n \geq 0$.</p>
<i>nrhs</i>	<p>INTEGER. The number of right-hand sides, the number of columns in B; $nrhs \geq 0$.</p>
<i>a</i> , <i>af</i> , <i>b</i> , <i>work</i>	<p>REAL for <code>sposvx</code></p> <p>DOUBLE PRECISION for <code>dposvx</code></p> <p>COMPLEX for <code>cposvx</code></p> <p>DOUBLE COMPLEX for <code>zposvx</code>.</p> <p>Arrays: <i>a</i>(size <i>lda</i> by *), <i>af</i>(size <i>ldaf</i> by *), <i>b</i>(size <i>ldb</i> by *), <i>work</i>(*).</p> <p>The array <i>a</i> contains the matrix A as specified by <i>uplo</i>. If <i>fact</i> = 'F' and <i>equed</i> = 'Y', then A must have been equilibrated by the scaling factors in <i>s</i>, and <i>a</i> must contain the equilibrated matrix $diag(s) * A * diag(s)$. The second dimension of <i>a</i> must be at least $\max(1, n)$.</p>

The array *af* is an input argument if *fact* = 'F'. It contains the triangular factor *U* or *L* from the Cholesky factorization of *A* in the same storage format as *A*. If *equed* is not 'N', then *af* is the factored form of the equilibrated matrix $\text{diag}(s) * A * \text{diag}(s)$. The second dimension of *af* must be at least $\max(1, n)$.

The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least $\max(1, nrhs)$.

work(*) is a workspace array. The dimension of *work* must be at least $\max(1, 3 * n)$ for real flavors, and at least $\max(1, 2 * n)$ for complex flavors.

lda INTEGER. The leading dimension of *a*; $lda \geq \max(1, n)$.

ldaf INTEGER. The leading dimension of *af*; $ldaf \geq \max(1, n)$.

ldb INTEGER. The leading dimension of *b*; $ldb \geq \max(1, n)$.

equed CHARACTER*1. Must be 'N' or 'Y'.

equed is an input argument if *fact* = 'F'. It specifies the form of equilibration that was done:

if *equed* = 'N', no equilibration was done (always true if *fact* = 'N');

if *equed* = 'Y', equilibration was done, that is, *A* has been replaced by $\text{diag}(s) * A * \text{diag}(s)$.

s REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, size (*n*). The array *s* contains the scale factors for *A*. This array is an input argument if *fact* = 'F' only; otherwise it is an output argument.

If *equed* = 'N', *s* is not accessed.

If *fact* = 'F' and *equed* = 'Y', each element of *s* must be positive.

ldx INTEGER. The leading dimension of the output array *x*; $ldx \geq \max(1, n)$.

iwork INTEGER. Workspace array, size at least $\max(1, n)$; used in real flavors only.

rwork REAL for cposvx

DOUBLE PRECISION for zposvx.

Workspace array, size at least $\max(1, n)$; used in complex flavors only.

Output Parameters

x REAL for sposvx

DOUBLE PRECISION for dposvx

COMPLEX for cposvx

DOUBLE COMPLEX for zposvx.

Array, size ldx by $*$.

If $info = 0$ or $info = n+1$, the array x contains the solution matrix X to the *original* system of equations. Note that if $equed = 'Y'$, A and B are modified on exit, and the solution to the equilibrated system is $inv(diag(s)) * X$. The second dimension of x must be at least $\max(1, nrhs)$.

a

Array a is not modified on exit if $fact = 'F'$ or $'N'$, or if $fact = 'E'$ and $equed = 'N'$.

If $fact = 'E'$ and $equed = 'Y'$, A is overwritten by $diag(s) * A * diag(s)$.

af

If $fact = 'N'$ or $'E'$, then af is an output argument and on exit returns the triangular factor U or L from the Cholesky factorization $A = U^T * U$ or $A = L * L^T$ (real routines), $A = U^H * U$ or $A = L * L^H$ (complex routines) of the original matrix A (if $fact = 'N'$), or of the equilibrated matrix A (if $fact = 'E'$). See the description of a for the form of the equilibrated matrix.

b

Overwritten by $diag(s) * B$, if $equed = 'Y'$; not changed if $equed = 'N'$.

s

This array is an output argument if $fact \neq 'F'$. See the description of s in *Input Arguments* section.

rcond

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

An estimate of the reciprocal condition number of the matrix A after equilibration (if done). If $rcond$ is less than the machine precision (in particular, if $rcond = 0$), the matrix is singular to working precision. This condition is indicated by a return code of $info > 0$.

ferr

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, size at least $\max(1, nrhs)$. Contains the estimated forward error bound for each solution vector x_j (the j -th column of the solution matrix X). If $xtrue$ is the true solution corresponding to x_j , $ferr(j)$ is an estimated upper bound for the magnitude of the largest element in $(x_j) - xtrue$ divided by the magnitude of the largest element in x_j . The estimate is as reliable as the estimate for $rcond$, and is almost always a slight overestimate of the true error.

berr

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, size at least $\max(1, nrhs)$. Contains the component-wise relative backward error for each solution vector x_j , that is, the smallest relative change in any element of A or B that makes x_j an exact solution.

equed

If *fact* ≠ 'F', then *equed* is an output argument. It specifies the form of equilibration that was done (see the description of *equed* in *Input Arguments* section).

info

INTEGER. If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, and $i \leq n$, the leading minor of order *i* (and therefore the matrix A itself) is not positive-definite, so the factorization could not be completed, and the solution and error bounds could not be computed; *rcond* = 0 is returned.

If *info* = *i*, and $i = n + 1$, then U is nonsingular, but *rcond* is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of *rcond* would suggest.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `posvx` interface are as follows:

<i>a</i>	Holds the matrix A of size (n, n) .
<i>b</i>	Holds the matrix B of size $(n, nrhs)$.
<i>x</i>	Holds the matrix X of size $(n, nrhs)$.
<i>af</i>	Holds the matrix AF of size (n, n) .
<i>s</i>	Holds the vector of length n . Default value for each element is $s(i) = 1.0_WP$.
<i>ferr</i>	Holds the vector of length $(nrhs)$.
<i>berr</i>	Holds the vector of length $(nrhs)$.
<i>uplo</i>	Must be 'U' or 'L'. The default value is 'U'.
<i>fact</i>	Must be 'N', 'E', or 'F'. The default value is 'N'. If <i>fact</i> = 'F', then <i>af</i> must be present; otherwise, an error is returned.
<i>equed</i>	Must be 'N' or 'Y'. The default value is 'N'.

Description

The routine uses the *Cholesky* factorization $A=U^T*U$ (real flavors) / $A=U^H*U$ (complex flavors) or $A=L*L^T$ (real flavors) / $A=L*L^H$ (complex flavors) to compute the solution to a real or complex system of linear equations $A*X = B$, where A is an n -by- n real symmetric/Hermitian positive definite matrix, the columns of matrix B are individual right-hand sides, and the columns of X are the corresponding solutions.

Both normwise and maximum componentwise error bounds are also provided on request. The routine returns a solution with a small guaranteed error ($O(\text{eps})$, where eps is the working machine precision) unless the matrix is very ill-conditioned, in which case a warning is returned. Relevant condition numbers are also calculated and returned.

The routine accepts user-provided factorizations and equilibration factors; see definitions of the *fact* and *equed* options. Solving with refinement and using a factorization from a previous call of the routine also produces a solution with $O(\text{eps})$ errors or warnings but that may not be true for general user-provided factorizations and equilibration factors if they differ from what the routine would itself produce.

The routine ?posvxx performs the following steps:

1. If *fact* = 'E', scaling factors are computed to equilibrate the system:

$$\text{diag}(s)*A*\text{diag}(s) * \text{inv}(\text{diag}(s))*X = \text{diag}(s)*B$$

Whether or not the system will be equilibrated depends on the scaling of the matrix A , but if equilibration is used, A is overwritten by $\text{diag}(s)*A*\text{diag}(s)$ and B by $\text{diag}(s)*B$.

2. If *fact* = 'N' or 'E', the Cholesky decomposition is used to factor the matrix A (after equilibration if *fact* = 'E') as

$$A = U^T*U \text{ (real)}, A = U^H*U \text{ (complex)}, \text{ if } \text{uplo} = 'U',$$

$$\text{or } A = L*L^T \text{ (real)}, A = L*L^H \text{ (complex)}, \text{ if } \text{uplo} = 'L',$$

where U is an upper triangular matrix and L is a lower triangular matrix.

3. If the leading i -by- i principal minor is not positive-definite, the routine returns with $info = i$. Otherwise, the factored form of A is used to estimate the condition number of the matrix A (see the *rcond* parameter). If the reciprocal of the condition number is less than machine precision, the routine still goes on to solve for X and compute error bounds.
4. The system of equations is solved for X using the factored form of A .
5. By default, unless *params*(1) is set to zero, the routine applies iterative refinement to get a small error and error bounds. Refinement calculates the residual to at least twice the working precision.
6. If equilibration was used, the matrix X is premultiplied by *diag*(s) so that it solves the original system before equilibration.

Input Parameters

<i>fact</i>	<p>CHARACTER*1. Must be 'F', 'N', or 'E'.</p> <p>Specifies whether or not the factored form of the matrix A is supplied on entry, and if not, whether the matrix A should be equilibrated before it is factored.</p> <p>If <i>fact</i> = 'F', on entry, <i>af</i> contains the factored form of A. If <i>equed</i> is not 'N', the matrix A has been equilibrated with scaling factors given by s. Parameters a and <i>af</i> are not modified.</p> <p>If <i>fact</i> = 'N', the matrix A will be copied to <i>af</i> and factored.</p> <p>If <i>fact</i> = 'E', the matrix A will be equilibrated, if necessary, copied to <i>af</i> and factored.</p>
<i>uplo</i>	<p>CHARACTER*1. Must be 'U' or 'L'.</p> <p>Indicates whether the upper or lower triangular part of A is stored:</p> <p>If <i>uplo</i> = 'U', the upper triangle of A is stored.</p> <p>If <i>uplo</i> = 'L', the lower triangle of A is stored.</p>
<i>n</i>	<p>INTEGER. The number of linear equations; the order of the matrix A; $n \geq 0$.</p>
<i>nrhs</i>	<p>INTEGER. The number of right-hand sides; the number of columns of the matrices B and X; $nrhs \geq 0$.</p>
<i>a</i> , <i>af</i> , <i>b</i> , <i>work</i>	<p>REAL for <i>sposvxx</i></p> <p>DOUBLE PRECISION for <i>dposvxx</i></p> <p>COMPLEX for <i>cposvxx</i></p> <p>DOUBLE COMPLEX for <i>zposvxx</i>.</p> <p>Arrays: <i>a</i>(size <i>lda</i> by *), <i>af</i>(size <i>ldaf</i> by *), <i>b</i>(size <i>ldb</i> by *), <i>work</i>(*).</p> <p>The array <i>a</i> contains the matrix A as specified by <i>uplo</i>. If <i>fact</i> = 'F' and <i>equed</i> = 'Y', then A must have been equilibrated by the scaling factors in s, and <i>a</i> must contain the equilibrated matrix $diag(s) * A * diag(s)$. The second dimension of <i>a</i> must be at least $\max(1, n)$.</p> <p>The array <i>af</i> is an input argument if <i>fact</i> = 'F'. It contains the triangular factor U or L from the Cholesky factorization of A in the same storage format as A. If <i>equed</i> is not 'N', then <i>af</i> is the factored form of the equilibrated matrix $diag(s) * A * diag(s)$. The second dimension of <i>af</i> must be at least $\max(1, n)$.</p>

The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least $\max(1, nrhs)$.

work(*) is a workspace array. The dimension of *work* must be at least $\max(1, 4*n)$ for real flavors, and at least $\max(1, 2*n)$ for complex flavors.

lda INTEGER. The leading dimension of the array *a*; $lda \geq \max(1, n)$.

ldaf INTEGER. The leading dimension of the array *af*; $ldaf \geq \max(1, n)$.

equed CHARACTER*1. Must be 'N' or 'Y'.

equed is an input argument if *fact* = 'F'. It specifies the form of equilibration that was done:

If *equed* = 'N', no equilibration was done (always true if *fact* = 'N').

if *equed* = 'Y', both row and column equilibration was done, that is, *A* has been replaced by $diag(s) * A * diag(s)$.

s REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, size (*n*). The array *s* contains the scale factors for *A*. This array is an input argument if *fact* = 'F' only; otherwise it is an output argument.

If *equed* = 'N', *s* is not accessed.

If *fact* = 'F' and *equed* = 'Y', each element of *s* must be positive.

Each element of *s* should be a power of the radix to ensure a reliable solution and error estimates. Scaling by powers of the radix does not cause rounding errors unless the result underflows or overflows. Rounding errors during scaling lead to refining with a matrix that is not equivalent to the input matrix, producing error estimates that may not be reliable.

ldb INTEGER. The leading dimension of the array *b*; $ldb \geq \max(1, n)$.

ldx INTEGER. The leading dimension of the output array *x*; $ldx \geq \max(1, n)$.

n_err_bnds INTEGER. Number of error bounds to return for each right hand side and each type (normwise or componentwise). See *err_bnds_norm* and *err_bnds_comp* descriptions in the *Output Arguments* section below.

nparams INTEGER. Specifies the number of parameters set in *params*. If ≤ 0 , the *params* array is never referenced and default values are used.

params REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, size *nparams*. Specifies algorithm parameters. If an entry is less than 0.0, that entry is filled with the default value used for that parameter. Only positions up to *nparams* are accessed; defaults are used for higher-numbered parameters. If defaults are acceptable, you can pass *nparams* = 0, which prevents the source code from accessing the *params* argument.

params(1) : Whether to perform iterative refinement or not. Default: 1.0 (for single precision flavors), 1.0D+0 (for double precision flavors).

=0.0 No refinement is performed and no error bounds are computed.

=1.0 Use the extra-precise refinement algorithm.

(Other values are reserved for future use.)

params(2) : Maximum number of residual computations allowed for refinement.

Default 10.0

Aggressive Set to 100.0 to permit convergence using approximate factorizations or factorizations other than *LU*. If the factorization uses a technique other than Gaussian elimination, the guarantees in *err_bnds_norm* and *err_bnds_comp* may no longer be trustworthy.

params(3) : Flag determining if the code will attempt to find a solution with a small componentwise relative error in the double-precision algorithm. Positive is true, 0.0 is false. Default: 1.0 (attempt componentwise convergence).

iwork INTEGER. Workspace array, size at least $\max(1, n)$; used in real flavors only.

rwork REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Workspace array, size at least $\max(1, 3*n)$; used in complex flavors only.

Output Parameters

x REAL for *sposvxx*
DOUBLE PRECISION for *dposvxx*
COMPLEX for *cposvxx*
DOUBLE COMPLEX for *zposvxx*.

Array, size *ldx* by *.

If *info* = 0, the array *x* contains the solution *n*-by-*nrhs* matrix *X* to the original system of equations. Note that *A* and *B* are modified on exit if *equed* ≠ 'N', and the solution to the equilibrated system is:

$\text{inv}(\text{diag}(s)) * X$.

a Array *a* is not modified on exit if *fact* = 'F' or 'N', or if *fact* = 'E' and *equed* = 'N'.

If *fact* = 'E' and *equed* = 'Y', *A* is overwritten by $\text{diag}(s) * A * \text{diag}(s)$.

<i>af</i>	<p>If <i>fact</i> = 'N' or 'E', then <i>af</i> is an output argument and on exit returns the triangular factor <i>U</i> or <i>L</i> from the Cholesky factorization $A=U^T*U$ or $A=L*L^T$ (real routines), $A=U^H*U$ or $A=L*L^H$ (complex routines) of the original matrix <i>A</i> (if <i>fact</i> = 'N'), or of the equilibrated matrix <i>A</i> (if <i>fact</i> = 'E'). See the description of <i>a</i> for the form of the equilibrated matrix.</p>
<i>b</i>	<p>If <i>equed</i> = 'N', <i>B</i> is not modified.</p> <p>If <i>equed</i> = 'Y', <i>B</i> is overwritten by $diag(s)*B$.</p>
<i>s</i>	<p>This array is an output argument if <i>fact</i>≠'F'. Each element of this array is a power of the radix. See the description of <i>s</i> in <i>Input Arguments</i> section.</p>
<i>rcond</i>	<p>REAL for single precision flavors</p> <p>DOUBLE PRECISION for double precision flavors.</p> <p>Reciprocal scaled condition number. An estimate of the reciprocal Skeel condition number of the matrix <i>A</i> after equilibration (if done). If <i>rcond</i> is less than the machine precision, in particular, if <i>rcond</i> = 0, the matrix is singular to working precision. Note that the error may still be small even if this number is very small and the matrix appears ill-conditioned.</p>
<i>rpvgrw</i>	<p>REAL for single precision flavors</p> <p>DOUBLE PRECISION for double precision flavors.</p> <p>Contains the reciprocal pivot growth factor:</p> $\ A\ /\ U\ $ <p>If this is much less than 1, the stability of the <i>LU</i> factorization of the (equilibrated) matrix <i>A</i> could be poor. This also means that the solution <i>X</i>, estimated condition numbers, and error bounds could be unreliable. If factorization fails with $0 < info \leq n$, this parameter contains the reciprocal pivot growth factor for the leading <i>info</i> columns of <i>A</i>.</p>
<i>berr</i>	<p>REAL for single precision flavors</p> <p>DOUBLE PRECISION for double precision flavors.</p> <p>Array, size at least $\max(1, nrhs)$. Contains the componentwise relative backward error for each solution vector $x(j)$, that is, the smallest relative change in any element of <i>A</i> or <i>B</i> that makes $x(j)$ an exact solution.</p>
<i>err_bnds_norm</i>	<p>REAL for single precision flavors</p> <p>DOUBLE PRECISION for double precision flavors.</p> <p>Array of size <i>nrhs</i> by <i>n_err_bnds</i>. For each right-hand side, contains information about various error bounds and condition numbers corresponding to the normwise relative error, which is defined as follows:</p> <p>Normwise relative error in the <i>i</i>-th solution vector</p> $\frac{\max_j X_{true_{ji}} - X_{ji} }{\max_j X_{ji} }$

The array is indexed by the type of error information as described below. There are currently up to three pieces of information returned.

The first index in `err_bnds_norm(i,:)` corresponds to the i -th right-hand side.

The second index in `err_bnds_norm(:,err)` contains the following three fields:

<code>err=1</code>	"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold $\sqrt{n} * \text{slamch}(\epsilon)$ for single precision flavors and $\sqrt{n} * \text{dlamch}(\epsilon)$ for double precision flavors.
<code>err=2</code>	"Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold $\sqrt{n} * \text{slamch}(\epsilon)$ for single precision flavors and $\sqrt{n} * \text{dlamch}(\epsilon)$ for double precision flavors. This error bound should only be trusted if the previous boolean is true.
<code>err=3</code>	Reciprocal condition number. Estimated normwise reciprocal condition number. Compared with the threshold $\sqrt{n} * \text{slamch}(\epsilon)$ for single precision flavors and $\sqrt{n} * \text{dlamch}(\epsilon)$ for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix Z are: $\ Z\ _{\infty} \cdot \ Z^{-1}\ _{\infty}$ <p>Let $z = s * a$, where s scales each row by a power of the radix so all absolute row sums of z are approximately 1.</p>

`err_bnds_comp`

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array of size `nrhs` by `n_err_bnds`. For each right-hand side, contains information about various error bounds and condition numbers corresponding to the componentwise relative error, which is defined as follows:

Componentwise relative error in the i -th solution vector:

$$\max_j \frac{|X_{true_{ji}} - X_{ji}|}{|X_{ji}|}$$

The array is indexed by the right-hand side i , on which the componentwise relative error depends, and by the type of error information as described below. There are currently up to three pieces of information returned for each right-hand side. If componentwise accuracy is not requested ($params(3) = 0.0$), then `err_bnds_comp` is not accessed. If $n_err_bnds < 3$, then at most the first $(:, n_err_bnds)$ entries are returned.

The first index in `err_bnds_comp(i, :)` corresponds to the i -th right-hand side.

The second index in `err_bnds_comp(:, err)` contains the following three fields:

<code>err=1</code>	"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold $\sqrt{n} * slamch(\epsilon)$ for single precision flavors and $\sqrt{n} * dlamch(\epsilon)$ for double precision flavors.
<code>err=2</code>	"Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold $\sqrt{n} * slamch(\epsilon)$ for single precision flavors and $\sqrt{n} * dlamch(\epsilon)$ for double precision flavors. This error bound should only be trusted if the previous boolean is true.
<code>err=3</code>	Reciprocal condition number. Estimated componentwise reciprocal condition number. Compared with the threshold $\sqrt{n} * slamch(\epsilon)$ for single precision flavors and $\sqrt{n} * dlamch(\epsilon)$ for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix Z are: $\ Z\ _{\infty} \cdot \ Z^{-1}\ _{\infty}$ Let $z = s * (a * \text{diag}(x))$, where x is the solution for the current right-hand side and s scales each row of $a * \text{diag}(x)$ by a power of the radix so all absolute row sums of z are approximately 1.

`equed` If `fact` is 'F', then `equed` is an output argument. It specifies the form of equilibration that was done (see the description of `equed` in *Input Arguments* section).

`params` If an entry is less than 0.0, that entry is filled with the default value used for that parameter, otherwise the entry is not modified.

`info` INTEGER. If `info = 0`, the execution is successful. The solution to every right-hand side is guaranteed.

If `info = -i`, the i -th parameter had an illegal value.

If $0 < \text{info} \leq n$: $U_{\text{info}, \text{info}}$ is exactly zero. The factorization has been completed, but the factor U is exactly singular, so the solution and error bounds could not be computed; $\text{rcond} = 0$ is returned.

If $\text{info} = n+j$: The solution corresponding to the j -th right-hand side is not guaranteed. The solutions corresponding to other right-hand sides k with $k > j$ may not be guaranteed as well, but only the first such right-hand side is reported. If a small componentwise error is not requested $\text{params}(3) = 0.0$, then the j -th right-hand side is the first with a normwise error bound that is not guaranteed (the smallest j such that $\text{err_bnds_norm}(j, 1) = 0.0$ or $\text{err_bnds_comp}(j, 1) = 0.0$. See the definition of err_bnds_norm and err_bnds_comp for $\text{err} = 1$. To get information about all of the right-hand sides, check err_bnds_norm or err_bnds_comp .

call ppsv( ap, b [,uplo] [,info] )
```

Include Files

- `mk1.fi`, `lapack.f90`

Description

The routine solves for X the real or complex system of linear equations $A^*X = B$, where A is an n -by- n real symmetric/Hermitian positive-definite matrix stored in packed format, the columns of matrix B are individual right-hand sides, and the columns of X are the corresponding solutions.

The Cholesky decomposition is used to factor A as

$A = U^T * U$ (real flavors) and $A = U^H * U$ (complex flavors), if $\text{uplo} = 'U'$

or $A = L * L^T$ (real flavors) and $A = L * L^H$ (complex flavors), if $\text{uplo} = 'L'$,

where U is an upper triangular matrix and L is a lower triangular matrix. The factored form of A is then used to solve the system of equations $A^*X = B$.

Input Parameters

uplo CHARACTER*1. Must be 'U' or 'L'.
Indicates whether the upper or lower triangular part of A is stored:
If $\text{uplo} = 'U'$, the upper triangle of A is stored.

If *uplo* = 'L', the lower triangle of *A* is stored.

n INTEGER. The order of matrix *A*; $n \geq 0$.

nrhs INTEGER. The number of right-hand sides, the number of columns in *B*; $nrhs \geq 0$.

ap, *b* REAL for *sppsv*
 DOUBLE PRECISION for *dppsv*
 COMPLEX for *cppsv*
 DOUBLE COMPLEX for *zppsv*.

Arrays: *ap*(size *), *b*(size *ldb*, *). The array *ap* contains the upper or the lower triangular part of the matrix *A* (as specified by *uplo*) in *packed storage* (see [Matrix Storage Schemes](#)). The dimension of *ap* must be at least $\max(1, n(n+1)/2)$.

The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least $\max(1, nrhs)$.

ldb INTEGER. The leading dimension of *b*; $ldb \geq \max(1, n)$.

Output Parameters

ap If *info* = 0, the upper or lower triangular part of *A* in packed storage is overwritten by the Cholesky factor *U* or *L*, as specified by *uplo*.

b Overwritten by the solution matrix *X*.

info INTEGER. If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, the leading minor of order *i* (and therefore the matrix *A* itself) is not positive-definite, so the factorization could not be completed, and the solution has not been computed.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine *ppsv* interface are as follows:

ap Holds the array *A* of size $(n*(n+1)/2)$.

b Holds the matrix *B* of size $(n, nrhs)$.

uplo Must be 'U' or 'L'. The default value is 'U'.

Description

The routine uses the Cholesky factorization $A=U^T*U$ (real flavors) / $A=U^H*U$ (complex flavors) or $A=L*L^T$ (real flavors) / $A=L*L^H$ (complex flavors) to compute the solution to a real or complex system of linear equations $A*X = B$, where A is a n -by- n symmetric or Hermitian positive-definite matrix stored in packed format, the columns of matrix B are individual right-hand sides, and the columns of X are the corresponding solutions.

Error bounds on the solution and a condition estimate are also provided.

The routine ?ppsvx performs the following steps:

1. If `fact = 'E'`, real scaling factors s are computed to equilibrate the system:

$$\text{diag}(s)*A*\text{diag}(s)*\text{inv}(\text{diag}(s))*X = \text{diag}(s)*B.$$

Whether or not the system will be equilibrated depends on the scaling of the matrix A , but if equilibration is used, A is overwritten by $\text{diag}(s)*A*\text{diag}(s)$ and B by $\text{diag}(s)*B$.

2. If `fact = 'N'` or `'E'`, the Cholesky decomposition is used to factor the matrix A (after equilibration if `fact = 'E'`) as

$$A = U^T*U \text{ (real)}, A = U^H*U \text{ (complex)}, \text{ if } \text{uplo} = 'U',$$

$$\text{or } A = L*L^T \text{ (real)}, A = L*L^H \text{ (complex)}, \text{ if } \text{uplo} = 'L',$$

where U is an upper triangular matrix and L is a lower triangular matrix.

3. If the leading i -by- i principal minor is not positive-definite, then the routine returns with `info = i`. Otherwise, the factored form of A is used to estimate the condition number of the matrix A . If the reciprocal of the condition number is less than machine precision, `info = n+1` is returned as a warning, but the routine still goes on to solve for X and compute error bounds as described below.
4. The system of equations is solved for X using the factored form of A .
5. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.
6. If equilibration was used, the matrix X is premultiplied by $\text{diag}(s)$ so that it solves the original system before equilibration.

Input Parameters

<i>fact</i>	<p>CHARACTER*1. Must be 'F', 'N', or 'E'.</p> <p>Specifies whether or not the factored form of the matrix <i>A</i> is supplied on entry, and if not, whether the matrix <i>A</i> should be equilibrated before it is factored.</p> <p>If <i>fact</i> = 'F': on entry, <i>afp</i> contains the factored form of <i>A</i>. If <i>equed</i> = 'Y', the matrix <i>A</i> has been equilibrated with scaling factors given by <i>s</i>. <i>ap</i> and <i>afp</i> will not be modified.</p> <p>If <i>fact</i> = 'N', the matrix <i>A</i> will be copied to <i>afp</i> and factored.</p> <p>If <i>fact</i> = 'E', the matrix <i>A</i> will be equilibrated if necessary, then copied to <i>afp</i> and factored.</p>
<i>uplo</i>	<p>CHARACTER*1. Must be 'U' or 'L'.</p> <p>Indicates whether the upper or lower triangular part of <i>A</i> is stored:</p> <p>If <i>uplo</i> = 'U', the upper triangle of <i>A</i> is stored.</p> <p>If <i>uplo</i> = 'L', the lower triangle of <i>A</i> is stored.</p>
<i>n</i>	<p>INTEGER. The order of matrix <i>A</i>; $n \geq 0$.</p>
<i>nrhs</i>	<p>INTEGER. The number of right-hand sides; the number of columns in <i>B</i>; $nrhs \geq 0$.</p>
<i>ap, afp, b, work</i>	<p>REAL for sppsvx DOUBLE PRECISION for dppsvx COMPLEX for cppsvx DOUBLE COMPLEX for zppsvx.</p> <p>Arrays: (size *), <i>afp</i>(size *), <i>b</i>(size <i>ldb</i> by *), <i>work</i>(*).</p> <p>The array <i>ap</i> contains the upper or lower triangle of the original symmetric/Hermitian matrix <i>A</i> in <i>packed storage</i> (see Matrix Storage Schemes). In case when <i>fact</i> = 'F' and <i>equed</i> = 'Y', <i>ap</i> must contain the equilibrated matrix $diag(s) * A * diag(s)$.</p> <p>The array <i>afp</i> is an input argument if <i>fact</i> = 'F' and contains the triangular factor <i>U</i> or <i>L</i> from the Cholesky factorization of <i>A</i> in the same storage format as <i>A</i>. If <i>equed</i> is not 'N', then <i>afp</i> is the factored form of the equilibrated matrix <i>A</i>.</p> <p>The array <i>b</i> contains the matrix <i>B</i> whose columns are the right-hand sides for the systems of equations.</p> <p><i>work</i>(*) is a workspace array.</p> <p>The dimension of arrays <i>ap</i> and <i>afp</i> must be at least $\max(1, n(n+1)/2)$; the second dimension of <i>b</i> must be at least $\max(1, nrhs)$; the dimension of <i>work</i> must be at least $\max(1, 3*n)$ for real flavors and $\max(1, 2*n)$ for complex flavors.</p>
<i>ldb</i>	<p>INTEGER. The leading dimension of <i>b</i>; $ldb \geq \max(1, n)$.</p>

<i>equed</i>	<p>CHARACTER*1. Must be 'N' or 'Y'.</p> <p><i>equed</i> is an input argument if <i>fact</i> = 'F'. It specifies the form of equilibration that was done:</p> <p>if <i>equed</i> = 'N', no equilibration was done (always true if <i>fact</i> = 'N');</p> <p>if <i>equed</i> = 'Y', equilibration was done, that is, <i>A</i> has been replaced by $\text{diag}(s)A\text{diag}(s)$.</p>
<i>s</i>	<p>REAL for single precision flavors</p> <p>DOUBLE PRECISION for double precision flavors.</p> <p>Array, size (<i>n</i>). The array <i>s</i> contains the scale factors for <i>A</i>. This array is an input argument if <i>fact</i> = 'F' only; otherwise it is an output argument.</p> <p>If <i>equed</i> = 'N', <i>s</i> is not accessed.</p> <p>If <i>fact</i> = 'F' and <i>equed</i> = 'Y', each element of <i>s</i> must be positive.</p>
<i>ldx</i>	<p>INTEGER. The leading dimension of the output array <i>x</i>; $\text{ldx} \geq \max(1, n)$.</p>
<i>iwork</i>	<p>INTEGER. Workspace array, size at least $\max(1, n)$; used in real flavors only.</p>
<i>rwork</i>	<p>REAL for cppsvx;</p> <p>DOUBLE PRECISION for zppsvx.</p> <p>Workspace array, size at least $\max(1, n)$; used in complex flavors only.</p>

Output Parameters

<i>x</i>	<p>REAL for sppsvx</p> <p>DOUBLE PRECISION for dppsvx</p> <p>COMPLEX for cppsvx</p> <p>DOUBLE COMPLEX for zppsvx.</p> <p>Array, size <i>ldx</i> by *.</p> <p>If <i>info</i> = 0 or <i>info</i> = <i>n</i>+1, the array <i>x</i> contains the solution matrix <i>X</i> to the <i>original</i> system of equations. Note that if <i>equed</i> = 'Y', <i>A</i> and <i>B</i> are modified on exit, and the solution to the equilibrated system is $\text{inv}(\text{diag}(s)) * X$. The second dimension of <i>x</i> must be at least $\max(1, \text{nrhs})$.</p>
<i>ap</i>	<p>Array <i>ap</i> is not modified on exit if <i>fact</i> = 'F' or 'N', or if <i>fact</i> = 'E' and <i>equed</i> = 'N'.</p> <p>If <i>fact</i> = 'E' and <i>equed</i> = 'Y', <i>ap</i> is overwritten by $\text{diag}(s) * A * \text{diag}(s)$.</p>

<i>afp</i>	<p>If <i>fact</i> = 'N' or 'E', then <i>afp</i> is an output argument and on exit returns the triangular factor <i>U</i> or <i>L</i> from the Cholesky factorization $A=U^T*U$ or $A=L*L^T$ (real routines), $A=U^H*U$ or $A=L*L^H$ (complex routines) of the original matrix <i>A</i> (if <i>fact</i> = 'N'), or of the equilibrated matrix <i>A</i> (if <i>fact</i> = 'E'). See the description of <i>ap</i> for the form of the equilibrated matrix.</p>
<i>b</i>	<p>Overwritten by <i>diag(s)*B</i>, if <i>equed</i> = 'Y'; not changed if <i>equed</i> = 'N'.</p>
<i>s</i>	<p>This array is an output argument if <i>fact</i> ≠ 'F'. See the description of <i>s</i> in <i>Input Arguments</i> section.</p>
<i>rcond</i>	<p>REAL for single precision flavors</p> <p>DOUBLE PRECISION for double precision flavors.</p> <p>An estimate of the reciprocal condition number of the matrix <i>A</i> after equilibration (if done). If <i>rcond</i> is less than the machine precision (in particular, if <i>rcond</i> = 0), the matrix is singular to working precision. This condition is indicated by a return code of <i>info</i> > 0.</p>
<i>ferr</i>	<p>REAL for single precision flavors</p> <p>DOUBLE PRECISION for double precision flavors.</p> <p>Array, size at least <code>max(1, nrhs)</code>. Contains the estimated forward error bound for each solution vector <i>x(j)</i> (the <i>j</i>-th column of the solution matrix <i>X</i>). If <i>xtrue</i> is the true solution corresponding to <i>x(j)</i>, <i>ferr(j)</i> is an estimated upper bound for the magnitude of the largest element in $(x(j) - xtrue)$ divided by the magnitude of the largest element in <i>x(j)</i>. The estimate is as reliable as the estimate for <i>rcond</i>, and is almost always a slight overestimate of the true error.</p>
<i>berr</i>	<p>REAL for single precision flavors</p> <p>DOUBLE PRECISION for double precision flavors.</p> <p>Array, size at least <code>max(1, nrhs)</code>. Contains the component-wise relative backward error for each solution vector <i>x(j)</i>, that is, the smallest relative change in any element of <i>A</i> or <i>B</i> that makes <i>x(j)</i> an exact solution.</p>
<i>equed</i>	<p>If <i>fact</i> ≠ 'F', then <i>equed</i> is an output argument. It specifies the form of equilibration that was done (see the description of <i>equed</i> in <i>Input Arguments</i> section).</p>
<i>info</i>	<p>INTEGER. If <i>info</i>=0, the execution is successful.</p> <p>If <i>info</i> = -<i>i</i>, the <i>i</i>-th parameter had an illegal value.</p> <p>If <i>info</i> = <i>i</i>, and $i \leq n$, the leading minor of order <i>i</i> (and therefore the matrix <i>A</i> itself) is not positive-definite, so the factorization could not be completed, and the solution and error bounds could not be computed; <i>rcond</i> = 0 is returned.</p>

If $info = i$, and $i = n + 1$, then U is nonsingular, but $rcond$ is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of $rcond$ would suggest.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `ppsvx` interface are as follows:

<code>ap</code>	Holds the array A of size $(n^*(n+1)/2)$.
<code>b</code>	Holds the matrix B of size $(n, nrhs)$.
<code>x</code>	Holds the matrix X of size $(n, nrhs)$.
<code>afp</code>	Holds the matrix AF of size $(n^*(n+1)/2)$.
<code>s</code>	Holds the vector of length n . Default value for each element is $s(i) = 1.0_WP$.
<code>ferr</code>	Holds the vector of length $(nrhs)$.
<code>berr</code>	Holds the vector of length $(nrhs)$.
<code>uplo</code>	Must be 'U' or 'L'. The default value is 'U'.
<code>fact</code>	Must be 'N', 'E', or 'F'. The default value is 'N'. If <code>fact = 'F'</code> , then <code>af</code> must be present; otherwise, an error is returned.
<code>equed</code>	Must be 'N' or 'Y'. The default value is 'N'.

Description

The routine solves for X the real or complex system of linear equations $A * X = B$, where A is an n -by- n symmetric/Hermitian positive definite band matrix, the columns of matrix B are individual right-hand sides, and the columns of X are the corresponding solutions.

The Cholesky decomposition is used to factor A as

$A = U^T * U$ (real flavors) and $A = U^H * U$ (complex flavors), if $uplo = 'U'$

or $A = L * L^T$ (real flavors) and $A = L * L^H$ (complex flavors), if $uplo = 'L'$,

where U is an upper triangular band matrix and L is a lower triangular band matrix, with the same number of superdiagonals or subdiagonals as A . The factored form of A is then used to solve the system of equations $A * X = B$.

Input Parameters

<i>uplo</i>	<p>CHARACTER*1. Must be 'U' or 'L'.</p> <p>Indicates whether the upper or lower triangular part of A is stored:</p> <p>If $uplo = 'U'$, the upper triangle of A is stored.</p> <p>If $uplo = 'L'$, the lower triangle of A is stored.</p>
<i>n</i>	<p>INTEGER. The order of matrix A; $n \geq 0$.</p>
<i>kd</i>	<p>INTEGER. The number of superdiagonals of the matrix A if $uplo = 'U'$, or the number of subdiagonals if $uplo = 'L'$; $kd \geq 0$.</p>
<i>nrhs</i>	<p>INTEGER. The number of right-hand sides, the number of columns in B; $nrhs \geq 0$.</p>
<i>ab, b</i>	<p>REAL for <code>spbsv</code></p> <p>DOUBLE PRECISION for <code>dpbsv</code></p> <p>COMPLEX for <code>cpbsv</code></p> <p>DOUBLE COMPLEX for <code>zpbsv</code>.</p> <p>Arrays: ab(size $ldab$ by *), b(size ldb by *). The array ab contains the upper or the lower triangular part of the matrix A (as specified by $uplo$) in <i>band storage</i> (see Matrix Storage Schemes). The second dimension of ab must be at least $\max(1, n)$.</p> <p>The array b contains the matrix B whose columns are the right-hand sides for the systems of equations. The second dimension of b must be at least $\max(1, nrhs)$.</p>
<i>ldab</i>	<p>INTEGER. The leading dimension of the array ab; $ldab \geq kd + 1$.</p>
<i>ldb</i>	<p>INTEGER. The leading dimension of b; $ldb \geq \max(1, n)$.</p>

Output Parameters

<i>ab</i>	The upper or lower triangular part of A (in band storage) is overwritten by the Cholesky factor U or L , as specified by <i>uplo</i> , in the same storage format as A .
<i>b</i>	Overwritten by the solution matrix X .
<i>info</i>	<p>INTEGER. If <i>info</i> = 0, the execution is successful.</p> <p>If <i>info</i> = $-i$, the i-th parameter had an illegal value.</p> <p>If <i>info</i> = i, the leading minor of order i (and therefore the matrix A itself) is not positive-definite, so the factorization could not be completed, and the solution has not been computed.</p>

Description

The routine uses the Cholesky factorization $A=U^T*U$ (real flavors) / $A=U^H*U$ (complex flavors) or $A=L*L^T$ (real flavors) / $A=L*L^H$ (complex flavors) to compute the solution to a real or complex system of linear equations $A*X = B$, where A is a n -by- n symmetric or Hermitian positive definite band matrix, the columns of matrix B are individual right-hand sides, and the columns of X are the corresponding solutions.

Error bounds on the solution and a condition estimate are also provided.

The routine `?pbsvx` performs the following steps:

1. If `fact = 'E'`, real scaling factors s are computed to equilibrate the system:

$$diag(s)*A*diag(s)*inv(diag(s))*X = diag(s)*B.$$

Whether or not the system will be equilibrated depends on the scaling of the matrix A , but if equilibration is used, A is overwritten by $diag(s)*A*diag(s)$ and B by $diag(s)*B$.

2. If `fact = 'N'` or `'E'`, the Cholesky decomposition is used to factor the matrix A (after equilibration if `fact = 'E'`) as

$$A = U^T*U \text{ (real), } A = U^H*U \text{ (complex), if } uplo = 'U',$$

$$\text{or } A = L*L^T \text{ (real), } A = L*L^H \text{ (complex), if } uplo = 'L',$$

where U is an upper triangular band matrix and L is a lower triangular band matrix.

3. If the leading i -by- i principal minor is not positive definite, then the routine returns with `info = i`. Otherwise, the factored form of A is used to estimate the condition number of the matrix A . If the reciprocal of the condition number is less than machine precision, `info = n+1` is returned as a warning, but the routine still goes on to solve for X and compute error bounds as described below.
4. The system of equations is solved for X using the factored form of A .
5. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.
6. If equilibration was used, the matrix X is premultiplied by $diag(s)$ so that it solves the original system before equilibration.

Input Parameters

<code>fact</code>	<p>CHARACTER*1. Must be 'F', 'N', or 'E'.</p> <p>Specifies whether or not the factored form of the matrix A is supplied on entry, and if not, whether the matrix A should be equilibrated before it is factored.</p> <p>If <code>fact = 'F'</code>: on entry, <code>afb</code> contains the factored form of A. If <code>equed = 'Y'</code>, the matrix A has been equilibrated with scaling factors given by s. <code>ab</code> and <code>afb</code> will not be modified.</p> <p>If <code>fact = 'N'</code>, the matrix A will be copied to <code>afb</code> and factored.</p> <p>If <code>fact = 'E'</code>, the matrix A will be equilibrated if necessary, then copied to <code>afb</code> and factored.</p>
<code>uplo</code>	<p>CHARACTER*1. Must be 'U' or 'L'.</p> <p>Indicates whether the upper or lower triangular part of A is stored:</p> <p>If <code>uplo = 'U'</code>, the upper triangle of A is stored.</p> <p>If <code>uplo = 'L'</code>, the lower triangle of A is stored.</p>
<code>n</code>	<p>INTEGER. The order of matrix A; $n \geq 0$.</p>

<i>kd</i>	INTEGER. The number of superdiagonals or subdiagonals in the matrix <i>A</i> ; $kd \geq 0$.
<i>nrhs</i>	INTEGER. The number of right-hand sides, the number of columns in <i>B</i> ; $nrhs \geq 0$.
<i>ab, afb, b, work</i>	<p>REAL for spbsvx DOUBLE PRECISION for dpbsvx COMPLEX for cpbsvx DOUBLE COMPLEX for zpbsvx.</p> <p>Arrays: <i>ab</i>(size <i>ldab</i> by *), <i>afb</i>(size <i>ldafb</i> by *), <i>b</i>(size <i>ldb</i> by *), <i>work</i>(*).</p> <p>The array <i>ab</i> contains the upper or lower triangle of the matrix <i>A</i> in <i>band storage</i> (see Matrix Storage Schemes).</p> <p>If <i>fact</i> = 'F' and <i>equed</i> = 'Y', then <i>ab</i> must contain the equilibrated matrix $diag(s) * A * diag(s)$. The second dimension of <i>ab</i> must be at least $\max(1, n)$.</p> <p>The array <i>afb</i> is an input argument if <i>fact</i> = 'F'. It contains the triangular factor <i>U</i> or <i>L</i> from the Cholesky factorization of the band matrix <i>A</i> in the same storage format as <i>A</i>. If <i>equed</i> = 'Y', then <i>afb</i> is the factored form of the equilibrated matrix <i>A</i>. The second dimension of <i>afb</i> must be at least $\max(1, n)$.</p> <p>The array <i>b</i> contains the matrix <i>B</i> whose columns are the right-hand sides for the systems of equations. The second dimension of <i>b</i> must be at least $\max(1, nrhs)$.</p> <p><i>work</i>(*) is a workspace array.</p> <p>The dimension of <i>work</i> must be at least $\max(1, 3*n)$ for real flavors, and at least $\max(1, 2*n)$ for complex flavors.</p>
<i>ldab</i>	INTEGER. The leading dimension of <i>ab</i> ; $ldab \geq kd+1$.
<i>ldafb</i>	INTEGER. The leading dimension of <i>afb</i> ; $ldafb \geq kd+1$.
<i>ldb</i>	INTEGER. The leading dimension of <i>b</i> ; $ldb \geq \max(1, n)$.
<i>equed</i>	<p>CHARACTER*1. Must be 'N' or 'Y'.</p> <p><i>equed</i> is an input argument if <i>fact</i> = 'F'. It specifies the form of equilibration that was done:</p> <p>if <i>equed</i> = 'N', no equilibration was done (always true if <i>fact</i> = 'N')</p> <p>if <i>equed</i> = 'Y', equilibration was done, that is, <i>A</i> has been replaced by $diag(s) * A * diag(s)$.</p>
<i>s</i>	<p>REAL for single precision flavors DOUBLE PRECISION for double precision flavors.</p>

Array, size (n). The array s contains the scale factors for A . This array is an input argument if $fact = 'F'$ only; otherwise it is an output argument.

If $equed = 'N'$, s is not accessed.

If $fact = 'F'$ and $equed = 'Y'$, each element of s must be positive.

ldx

INTEGER. The leading dimension of the output array x ; $ldx \geq \max(1, n)$.

$iwork$

INTEGER. Workspace array, size at least $\max(1, n)$; used in real flavors only.

$rwork$

REAL for $cpbsvx$

DOUBLE PRECISION for $zpbsvx$.

Workspace array, size at least $\max(1, n)$; used in complex flavors only.

Output Parameters

x

REAL for $spbsvx$

DOUBLE PRECISION for $dpbsvx$

COMPLEX for $cpbsvx$

DOUBLE COMPLEX for $zpbsvx$.

Array, size ldx by $*$.

If $info = 0$ or $info = n+1$, the array x contains the solution matrix X to the *original* system of equations. Note that if $equed = 'Y'$, A and B are modified on exit, and the solution to the equilibrated system is $\text{inv}(\text{diag}(s)) * X$. The second dimension of x must be at least $\max(1, nrhs)$.

ab

On exit, if $fact = 'E'$ and $equed = 'Y'$, A is overwritten by $\text{diag}(s) * A * \text{diag}(s)$.

afb

If $fact = 'N'$ or $'E'$, then afb is an output argument and on exit returns the triangular factor U or L from the Cholesky factorization $A = U^T * U$ or $A = L * L^T$ (real routines), $A = U^H * U$ or $A = L * L^H$ (complex routines) of the original matrix A (if $fact = 'N'$), or of the equilibrated matrix A (if $fact = 'E'$). See the description of ab for the form of the equilibrated matrix.

b

Overwritten by $\text{diag}(s) * B$, if $equed = 'Y'$; not changed if $equed = 'N'$.

s

This array is an output argument if $fact \neq 'F'$. See the description of s in *Input Arguments* section.

$rcond$

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

An estimate of the reciprocal condition number of the matrix A after equilibration (if done). If $rcond$ is less than the machine precision (in particular, if $rcond = 0$), the matrix is singular to working precision. This condition is indicated by a return code of $info > 0$.

ferr

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, size at least $\max(1, nrhs)$. Contains the estimated forward error bound for each solution vector $x(j)$ (the j -th column of the solution matrix X). If $xtrue$ is the true solution corresponding to $x(j)$, $ferr(j)$ is an estimated upper bound for the magnitude of the largest element in $(x(j) - xtrue)$ divided by the magnitude of the largest element in $x(j)$. The estimate is as reliable as the estimate for $rcond$, and is almost always a slight overestimate of the true error.

berr

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, size at least $\max(1, nrhs)$. Contains the component-wise relative backward error for each solution vector $x(j)$, that is, the smallest relative change in any element of A or B that makes $x(j)$ an exact solution.

equed

If $fact \neq 'F'$, then *equed* is an output argument. It specifies the form of equilibration that was done (see the description of *equed* in *Input Arguments* section).

info

INTEGER. If $info = 0$, the execution is successful.

If $info = -i$, the i -th parameter had an illegal value.

If $info = i$, and $i \leq n$, the leading minor of order i (and therefore the matrix A itself) is not positive definite, so the factorization could not be completed, and the solution and error bounds could not be computed; $rcond = 0$ is returned. If $info = i$, and $i = n + 1$, then U is nonsingular, but $rcond$ is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of $rcond$ would suggest.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `pbsvx` interface are as follows:

ab

Holds the array A of size $(kd+1, n)$.

b

Holds the matrix B of size $(n, nrhs)$.

x

Holds the matrix X of size $(n, nrhs)$.

<i>afb</i>	Holds the array <i>AF</i> of size $(kd+1, n)$.
<i>s</i>	Holds the vector with the number of elements <i>n</i> . Default value for each element is $s(i) = 1.0_WP$.
<i>ferr</i>	Holds the vector with the number of elements <i>nrhs</i> .
<i>berr</i>	Holds the vector with the number of elements <i>nrhs</i> .
<i>uplo</i>	Must be 'U' or 'L'. The default value is 'U'.
<i>fact</i>	Must be 'N', 'E', or 'F'. The default value is 'N'. If <i>fact</i> = 'F', then <i>af</i> must be present; otherwise, an error is returned.
<i>equed</i>	Must be 'N' or 'Y'. The default value is 'N'.

Description

The routine solves for *X* the real or complex system of linear equations $A * X = B$, where *A* is an *n*-by-*n* symmetric/Hermitian positive-definite tridiagonal matrix, the columns of matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.

A is factored as $A = L * D * L^T$ (real flavors) or $A = L * D * L^H$ (complex flavors), and the factored form of *A* is then used to solve the system of equations $A * X = B$.

Input Parameters

<i>n</i>	INTEGER. The order of matrix <i>A</i> ; $n \geq 0$.
<i>nrhs</i>	INTEGER. The number of right-hand sides, the number of columns in <i>B</i> ; $nrhs \geq 0$.
<i>d</i>	REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, dimension at least $\max(1, n)$. Contains the diagonal elements of the tridiagonal matrix A .

e, b

REAL for `sptsv`

DOUBLE PRECISION for `dptsv`

COMPLEX for `cptsv`

DOUBLE COMPLEX for `zptsv`.

Arrays: e (size $n - 1$), b (size ldb by $*$). The array e contains the $(n - 1)$ subdiagonal elements of A .

The array b contains the matrix B whose columns are the right-hand sides for the systems of equations. The second dimension of b must be at least $\max(1, nrhs)$.

ldb

INTEGER. The leading dimension of b ; $ldb \geq \max(1, n)$.

Output Parameters

d

Overwritten by the n diagonal elements of the diagonal matrix D from the $L^*D^*L^T$ (real)/ $L^*D^*L^H$ (complex) factorization of A .

e

Overwritten by the $(n - 1)$ subdiagonal elements of the unit bidiagonal factor L from the factorization of A .

b

Overwritten by the solution matrix X .

$info$

INTEGER. If $info = 0$, the execution is successful.

If $info = -i$, the i -th parameter had an illegal value.

If $info = i$, the leading minor of order i (and therefore the matrix A itself) is not positive-definite, and the solution has not been computed. The factorization has not been completed unless $i = n$.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `ptsv` interface are as follows:

d

Holds the vector of length n .

e

Holds the vector of length $(n-1)$.

b

Holds the matrix B of size $(n, nrhs)$.

Description

The routine uses the Cholesky factorization $A = L^*D*L^T$ (real)/ $A = L^*D*L^H$ (complex) to compute the solution to a real or complex system of linear equations $A^*X = B$, where A is a n -by- n symmetric or Hermitian positive definite tridiagonal matrix, the columns of matrix B are individual right-hand sides, and the columns of X are the corresponding solutions.

Error bounds on the solution and a condition estimate are also provided.

The routine ?ptsvx performs the following steps:

1. If $fact = 'N'$, the matrix A is factored as $A = L^*D*L^T$ (real flavors)/ $A = L^*D*L^H$ (complex flavors), where L is a unit lower bidiagonal matrix and D is diagonal. The factorization can also be regarded as having the form $A = U^T*D*U$ (real flavors)/ $A = U^H*D*U$ (complex flavors).
2. If the leading i -by- i principal minor is not positive-definite, then the routine returns with $info = i$. Otherwise, the factored form of A is used to estimate the condition number of the matrix A . If the reciprocal of the condition number is less than machine precision, $info = n+1$ is returned as a warning, but the routine still goes on to solve for X and compute error bounds as described below.
3. The system of equations is solved for X using the factored form of A .
4. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.

Input Parameters

fact

CHARACTER*1. Must be 'F' or 'N'.

Specifies whether or not the factored form of the matrix A is supplied on entry.

If $fact = 'F'$: on entry, df and ef contain the factored form of A . Arrays d , e , df , and ef will not be modified.

If $fact = 'N'$, the matrix A will be copied to df and ef , and factored.

n	INTEGER. The order of matrix A ; $n \geq 0$.
$nrhs$	INTEGER. The number of right-hand sides, the number of columns in B ; $nrhs \geq 0$.
$d, df, rwork$	<p>REAL for single precision flavors</p> <p>DOUBLE PRECISION for double precision flavors.</p> <p>Arrays: d (size n), df (size n), $rwork(n)$.</p> <p>The array d contains the n diagonal elements of the tridiagonal matrix A.</p> <p>The array df is an input argument if $fact = 'F'$ and on entry contains the n diagonal elements of the diagonal matrix D from the $L^*D^*L^T$ (real)/ $L^*D^*L^H$ (complex) factorization of A.</p> <p>The array $rwork$ is a workspace array used for complex flavors only.</p>
$e, ef, b, work$	<p>REAL for sptsvx</p> <p>DOUBLE PRECISION for dptsvx</p> <p>COMPLEX for cptsvx</p> <p>DOUBLE COMPLEX for zptsvx.</p> <p>Arrays: e (size $n-1$), ef (size $n-1$), b(size $ldb, *$), $work(*)$. The array e contains the $(n-1)$ subdiagonal elements of the tridiagonal matrix A.</p> <p>The array ef is an input argument if $fact = 'F'$ and on entry contains the $(n-1)$ subdiagonal elements of the unit bidiagonal factor L from the $L^*D^*L^T$ (real)/ $L^*D^*L^H$ (complex) factorization of A.</p> <p>The array b contains the matrix B whose columns are the right-hand sides for the systems of equations.</p> <p>The array $work$ is a workspace array. The dimension of $work$ must be at least $2*n$ for real flavors, and at least n for complex flavors.</p>
ldb	INTEGER. The leading dimension of b ; $ldb \geq \max(1, n)$.
ldx	INTEGER. The leading dimension of x ; $ldx \geq \max(1, n)$.

Output Parameters

x	<p>REAL for sptsvx</p> <p>DOUBLE PRECISION for dptsvx</p> <p>COMPLEX for cptsvx</p> <p>DOUBLE COMPLEX for zptsvx.</p> <p>Array, size ldx by $*$.</p> <p>If $info = 0$ or $info = n+1$, the array x contains the solution matrix X to the system of equations. The second dimension of x must be at least $\max(1, nrhs)$.</p>
-----	---

<i>df, ef</i>	These arrays are output arguments if <i>fact</i> = 'N'. See the description of <i>df, ef</i> in <i>Input Arguments</i> section.
<i>rcond</i>	<p>REAL for single precision flavors</p> <p>DOUBLE PRECISION for double precision flavors.</p> <p>An estimate of the reciprocal condition number of the matrix <i>A</i> after equilibration (if done). If <i>rcond</i> is less than the machine precision (in particular, if <i>rcond</i> = 0), the matrix is singular to working precision. This condition is indicated by a return code of <i>info</i> > 0.</p>
<i>ferr</i>	<p>REAL for single precision flavors</p> <p>DOUBLE PRECISION for double precision flavors.</p> <p>Array, size at least $\max(1, nrhs)$. Contains the estimated forward error bound for each solution vector $x(j)$ (the <i>j</i>-th column of the solution matrix <i>X</i>). If <i>xtrue</i> is the true solution corresponding to $x(j)$, <i>ferr</i>(<i>j</i>) is an estimated upper bound for the magnitude of the largest element in $(x(j) - xtrue)$ divided by the magnitude of the largest element in $x(j)$. The estimate is as reliable as the estimate for <i>rcond</i>, and is almost always a slight overestimate of the true error.</p>
<i>berr</i>	<p>REAL for single precision flavors</p> <p>DOUBLE PRECISION for double precision flavors.</p> <p>Array, size at least $\max(1, nrhs)$. Contains the component-wise relative backward error for each solution vector $x(j)$, that is, the smallest relative change in any element of <i>A</i> or <i>B</i> that makes $x(j)$ an exact solution.</p>
<i>info</i>	<p>INTEGER. If <i>info</i> = 0, the execution is successful.</p> <p>If <i>info</i> = -<i>i</i>, the <i>i</i>-th parameter had an illegal value.</p> <p>If <i>info</i> = <i>i</i>, and $i \leq n$, the leading minor of order <i>i</i> (and therefore the matrix <i>A</i> itself) is not positive-definite, so the factorization could not be completed, and the solution and error bounds could not be computed; <i>rcond</i> = 0 is returned.</p> <p>If <i>info</i> = <i>i</i>, and $i = n + 1$, then <i>U</i> is nonsingular, but <i>rcond</i> is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of <i>rcond</i> would suggest.</p>

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `ptsvx` interface are as follows:

<i>d</i>	Holds the vector of length <i>n</i> .
<i>e</i>	Holds the vector of length (<i>n</i> -1).

<i>b</i>	Holds the matrix <i>B</i> of size $(n, nrhs)$.
<i>x</i>	Holds the matrix <i>X</i> of size $(n, nrhs)$.
<i>df</i>	Holds the vector of length <i>n</i> .
<i>ef</i>	Holds the vector of length $(n-1)$.
<i>ferr</i>	Holds the vector of length $(nrhs)$.
<i>berr</i>	Holds the vector of length $(nrhs)$.
<i>fact</i>	Must be 'N' or 'F'. The default value is 'N'. If <i>fact</i> = 'F', then both arguments <i>af</i> and <i>ipiv</i> must be present; otherwise, an error is returned.

Description

The routine solves for *X* the real or complex system of linear equations $A * X = B$, where *A* is an *n*-by-*n* symmetric matrix, the columns of matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.

The diagonal pivoting method is used to factor *A* as $A = U * D * U^T$ or $A = L * D * L^T$, where *U* (or *L*) is a product of permutation and unit upper (lower) triangular matrices, and *D* is symmetric and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

The factored form of *A* is then used to solve the system of equations $A * X = B$.

Input Parameters

<i>uplo</i>	CHARACTER*1. Must be 'U' or 'L'.
	Indicates whether the upper or lower triangular part of <i>A</i> is stored:
	If <i>uplo</i> = 'U', the upper triangle of <i>A</i> is stored.
	If <i>uplo</i> = 'L', the lower triangle of <i>A</i> is stored.

<i>n</i>	INTEGER. The order of matrix <i>A</i> ; $n \geq 0$.
<i>nrhs</i>	INTEGER. The number of right-hand sides; the number of columns in <i>B</i> ; $nrhs \geq 0$.
<i>a</i> , <i>b</i> , <i>work</i>	<p>REAL for <i>ssysv</i></p> <p>DOUBLE PRECISION for <i>dsysv</i></p> <p>COMPLEX for <i>csysv</i></p> <p>DOUBLE COMPLEX for <i>zsysv</i>.</p> <p>Arrays: <i>a</i>(size <i>lda</i> by *), <i>b</i>(size <i>ldb</i> by *), <i>work</i>(*).</p> <p>The array <i>a</i> contains the upper or the lower triangular part of the symmetric matrix <i>A</i> (see <i>uplo</i>). The second dimension of <i>a</i> must be at least $\max(1, n)$.</p> <p>The array <i>b</i> contains the matrix <i>B</i> whose columns are the right-hand sides for the systems of equations. The second dimension of <i>b</i> must be at least $\max(1, nrhs)$.</p> <p><i>work</i> is a workspace array, dimension at least $\max(1, lwork)$.</p>
<i>lda</i>	INTEGER. The leading dimension of <i>a</i> ; $lda \geq \max(1, n)$.
<i>ldb</i>	INTEGER. The leading dimension of <i>b</i> ; $ldb \geq \max(1, n)$.
<i>lwork</i>	<p>INTEGER. The size of the <i>work</i> array; $lwork \geq 1$.</p> <p>If <i>lwork</i> = -1, then a workspace query is assumed; the routine only calculates the optimal size of the <i>work</i> array, returns this value as the first entry of the <i>work</i> array, and no error message related to <i>lwork</i> is issued by <i>xerbla</i>. See <i>Application Notes</i> below for details and for the suggested value of <i>lwork</i>.</p>

Output Parameters

<i>a</i>	If <i>info</i> = 0, <i>a</i> is overwritten by the block-diagonal matrix <i>D</i> and the multipliers used to obtain the factor <i>U</i> (or <i>L</i>) from the factorization of <i>A</i> as computed by ?sytrf .
<i>b</i>	If <i>info</i> = 0, <i>b</i> is overwritten by the solution matrix <i>X</i> .
<i>ipiv</i>	<p>INTEGER.</p> <p>Array, size at least $\max(1, n)$. Contains details of the interchanges and the block structure of <i>D</i>, as determined by ?sytrf.</p> <p>If <i>ipiv</i>(<i>i</i>) = <i>k</i> > 0, then <i>d_{ii}</i> is a 1-by-1 diagonal block, and the <i>i</i>-th row and column of <i>A</i> was interchanged with the <i>k</i>-th row and column.</p> <p>If <i>uplo</i> = 'U' and <i>ipiv</i>(<i>i</i>) = <i>ipiv</i>(<i>i</i>-1) = -<i>m</i> < 0, then <i>D</i> has a 2-by-2 block in rows/columns <i>i</i> and <i>i</i>-1, and (<i>i</i>-1)-th row and column of <i>A</i> was interchanged with the <i>m</i>-th row and column.</p> <p>If <i>uplo</i> = 'L' and <i>ipiv</i>(<i>i</i>) = <i>ipiv</i>(<i>i</i>+1) = -<i>m</i> < 0, then <i>D</i> has a 2-by-2 block in rows/columns <i>i</i> and <i>i</i>+1, and (<i>i</i>+1)-th row and column of <i>A</i> was interchanged with the <i>m</i>-th row and column.</p>

<code>work(1)</code>	If <code>info = 0</code> , on exit <code>work(1)</code> contains the minimum value of <code>lwork</code> required for optimum performance. Use this <code>lwork</code> for subsequent runs.
<code>info</code>	INTEGER. If <code>info = 0</code> , the execution is successful. If <code>info = -i</code> , the <i>i</i> -th parameter had an illegal value. If <code>info = i</code> , d_{ii} is 0. The factorization has been completed, but <i>D</i> is exactly singular, so the solution could not be computed.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `sysv` interface are as follows:

<code>a</code>	Holds the matrix <i>A</i> of size (n, n) .
<code>b</code>	Holds the matrix <i>B</i> of size $(n, nrhs)$.
<code>ipiv</code>	Holds the vector of length <i>n</i> .
<code>uplo</code>	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

For better performance, try using `lwork = n*blocksize`, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of `lwork` for the first run or set `lwork = -1`.

If you choose the first option and set any of admissible `lwork` sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array `work` on exit. Use this value (`work(1)`) for subsequent runs.

If you set `lwork = -1`, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (`work`). This operation is called a workspace query.

Note that if you set `lwork` to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

Description

The routine uses the diagonal pivoting factorization to compute the solution to a real or complex system of linear equations $A \cdot X = B$, where A is a n -by- n symmetric matrix, the columns of matrix B are individual right-hand sides, and the columns of X are the corresponding solutions.

Error bounds on the solution and a condition estimate are also provided.

The routine ?sysvx performs the following steps:

1. If $fact = 'N'$, the diagonal pivoting method is used to factor the matrix A . The form of the factorization is $A = U \cdot D \cdot U^T$ or $A = L \cdot D \cdot L^T$, where U (or L) is a product of permutation and unit upper (lower) triangular matrices, and D is symmetric and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.
2. If some $d_{i,i} = 0$, so that D is exactly singular, then the routine returns with $info = i$. Otherwise, the factored form of A is used to estimate the condition number of the matrix A . If the reciprocal of the condition number is less than machine precision, $info = n+1$ is returned as a warning, but the routine still goes on to solve for X and compute error bounds as described below.
3. The system of equations is solved for X using the factored form of A .
4. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.

Input Parameters

fact CHARACTER*1. Must be 'F' or 'N'.
Specifies whether or not the factored form of the matrix A has been supplied on entry.
If $fact = 'F'$: on entry, af and $ipiv$ contain the factored form of A . Arrays a , af , and $ipiv$ will not be modified.

If *fact* = 'N', the matrix *A* will be copied to *af* and factored.

uplo

CHARACTER*1. Must be 'U' or 'L'.

Indicates whether the upper or lower triangular part of *A* is stored:

If *uplo* = 'U', the upper triangle of *A* is stored.

If *uplo* = 'L', the lower triangle of *A* is stored.

n

INTEGER. The order of matrix *A*; $n \geq 0$.

nrhs

INTEGER. The number of right-hand sides, the number of columns in *B*; $nrhs \geq 0$.

a, af, b, work

REAL for *ssysvx*

DOUBLE PRECISION for *dsysvx*

COMPLEX for *csysvx*

DOUBLE COMPLEX for *zsysvx*.

Arrays: *a*(size *lda* by *), *af*(size *ldaf* by *), *b*(size *ldb* by *), *work*(*).

The array *a* contains the upper or the lower triangular part of the symmetric matrix *A* (see *uplo*). The second dimension of *a* must be at least $\max(1, n)$.

The array *af* is an input argument if *fact* = 'F'. It contains the block diagonal matrix *D* and the multipliers used to obtain the factor *U* or *L* from the factorization $A = U * D * U^T$ or $A = L * D * L^T$ as computed by ?[sytrf](#). The second dimension of *af* must be at least $\max(1, n)$.

The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least $\max(1, nrhs)$.

work(*) is a workspace array, dimension at least $\max(1, lwork)$.

lda

INTEGER. The leading dimension of *a*; $lda \geq \max(1, n)$.

ldaf

INTEGER. The leading dimension of *af*; $ldaf \geq \max(1, n)$.

ldb

INTEGER. The leading dimension of *b*; $ldb \geq \max(1, n)$.

ipiv

INTEGER.

Array, size at least $\max(1, n)$. The array *ipiv* is an input argument if *fact* = 'F'. It contains details of the interchanges and the block structure of *D*, as determined by ?[sytrf](#).

If *ipiv*(*i*) = *k* > 0, then *d_{ii}* is a 1-by-1 diagonal block, and the *i*-th row and column of *A* was interchanged with the *k*-th row and column.

If *uplo* = 'U' and *ipiv*(*i*) = *ipiv*(*i*-1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*-1, and (*i*-1)-th row and column of *A* was interchanged with the *m*-th row and column.

If *uplo* = 'L' and *ipiv*(*i*) = *ipiv*(*i*+1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*+1, and (*i*+1)-th row and column of *A* was interchanged with the *m*-th row and column.

<i>ldx</i>	INTEGER. The leading dimension of the output array <i>x</i> ; $ldx \geq \max(1, n)$.
<i>lwork</i>	<p>INTEGER. The size of the <i>work</i> array.</p> <p>If <i>lwork</i> = -1, then a workspace query is assumed; the routine only calculates the optimal size of the <i>work</i> array, returns this value as the first entry of the <i>work</i> array, and no error message related to <i>lwork</i> is issued by xerbla. See <i>Application Notes</i> below for details and for the suggested value of <i>lwork</i>.</p>
<i>iwork</i>	INTEGER. Workspace array, size at least $\max(1, n)$; used in real flavors only.
<i>rwork</i>	<p>REAL for csysvx;</p> <p>DOUBLE PRECISION for zsysvx.</p> <p>Workspace array, size at least $\max(1, n)$; used in complex flavors only.</p>

Output Parameters

<i>x</i>	<p>REAL for ssysvx</p> <p>DOUBLE PRECISION for dsysvx</p> <p>COMPLEX for csysvx</p> <p>DOUBLE COMPLEX for zsysvx.</p> <p>Array, size <i>ldx</i> by *.</p> <p>If <i>info</i> = 0 or <i>info</i> = <i>n</i>+1, the array <i>x</i> contains the solution matrix <i>X</i> to the system of equations. The second dimension of <i>x</i> must be at least $\max(1, nrhs)$.</p>
<i>af, ipiv</i>	<p>These arrays are output arguments if <i>fact</i> = 'N'.</p> <p>See the description of <i>af, ipiv</i> in <i>Input Arguments</i> section.</p>
<i>rcond</i>	<p>REAL for single precision flavors</p> <p>DOUBLE PRECISION for double precision flavors.</p> <p>An estimate of the reciprocal condition number of the matrix <i>A</i>. If <i>rcond</i> is less than the machine precision (in particular, if <i>rcond</i> = 0), the matrix is singular to working precision. This condition is indicated by a return code of <i>info</i> > 0.</p>
<i>ferr</i>	<p>REAL for single precision flavors</p> <p>DOUBLE PRECISION for double precision flavors.</p> <p>Array, size at least $\max(1, nrhs)$. Contains the estimated forward error bound for each solution vector <i>x</i>(<i>j</i>) (the <i>j</i>-th column of the solution matrix <i>X</i>). If <i>xtrue</i> is the true solution corresponding to <i>x</i>(<i>j</i>), <i>ferr</i>(<i>j</i>) is an estimated upper bound for the magnitude of the largest element in (<i>x</i>(<i>j</i>) - <i>xtrue</i>) divided by the magnitude of the largest element in <i>x</i>(<i>j</i>). The estimate is as reliable as the estimate for <i>rcond</i>, and is almost always a slight overestimate of the true error.</p>

<i>berr</i>	<p>REAL for single precision flavors</p> <p>DOUBLE PRECISION for double precision flavors.</p> <p>Array, size at least $\max(1, nrhs)$. Contains the component-wise relative backward error for each solution vector $x(j)$, that is, the smallest relative change in any element of A or B that makes $x(j)$ an exact solution.</p>
<i>work</i> (1)	<p>If <i>info</i>=0, on exit <i>work</i>(1) contains the minimum value of <i>lwork</i> required for optimum performance. Use this <i>lwork</i> for subsequent runs.</p>
<i>info</i>	<p>INTEGER. If <i>info</i> = 0, the execution is successful.</p> <p>If <i>info</i> = -<i>i</i>, the <i>i</i>-th parameter had an illegal value.</p> <p>If <i>info</i> = <i>i</i>, and $i \leq n$, then d_{ii} is exactly zero. The factorization has been completed, but the block diagonal matrix D is exactly singular, so the solution and error bounds could not be computed; <i>rcond</i> = 0 is returned.</p> <p>If <i>info</i> = <i>i</i>, and $i = n + 1$, then D is nonsingular, but <i>rcond</i> is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of <i>rcond</i> would suggest.</p>

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `sysvx` interface are as follows:

<i>a</i>	Holds the matrix A of size (n, n) .
<i>b</i>	Holds the matrix B of size $(n, nrhs)$.
<i>x</i>	Holds the matrix X of size $(n, nrhs)$.
<i>af</i>	Holds the matrix AF of size (n, n) .
<i>ipiv</i>	Holds the vector of length n .
<i>ferr</i>	Holds the vector of length $(nrhs)$.
<i>berr</i>	Holds the vector of length $(nrhs)$.
<i>uplo</i>	Must be 'U' or 'L'. The default value is 'U'.
<i>fact</i>	Must be 'N' or 'F'. The default value is 'N'. If <i>fact</i> = 'F', then both arguments <i>af</i> and <i>ipiv</i> must be present; otherwise, an error is returned.

Application Notes

The value of *lwork* must be at least $\max(1, m*n)$, where for real flavors $m = 3$ and for complex flavors $m = 2$. For better performance, try using $lwork = \max(1, m*n, n*blocksize)$, where *blocksize* is the optimal block size for ?sytrf.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

Description

The routine uses the *diagonal pivoting* factorization to compute the solution to a real or complex system of linear equations $A*X = B$, where *A* is an *n*-by-*n* real symmetric/Hermitian matrix, the columns of matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.

Both normwise and maximum componentwise error bounds are also provided on request. The routine returns a solution with a small guaranteed error ($O(eps)$, where *eps* is the working machine precision) unless the matrix is very ill-conditioned, in which case a warning is returned. Relevant condition numbers are also calculated and returned.

The routine accepts user-provided factorizations and equilibration factors; see definitions of the *fact* and *equed* options. Solving with refinement and using a factorization from a previous call of the routine also produces a solution with $O(\epsilon)$ errors or warnings but that may not be true for general user-provided factorizations and equilibration factors if they differ from what the routine would itself produce.

The routine `?sysvxx` performs the following steps:

1. If *fact* = 'E', scaling factors are computed to equilibrate the system:

$$\text{diag}(s) * A * \text{diag}(s) * \text{inv}(\text{diag}(s)) * X = \text{diag}(s) * B$$

Whether or not the system will be equilibrated depends on the scaling of the matrix *A*, but if equilibration is used, *A* is overwritten by $\text{diag}(s) * A * \text{diag}(s)$ and *B* by $\text{diag}(s) * B$.

2. If *fact* = 'N' or 'E', the LU decomposition is used to factor the matrix *A* (after equilibration if *fact* = 'E') as

$$A = U * D * U^T, \text{ if } \text{uplo} = 'U',$$

$$\text{or } A = L * D * L^T, \text{ if } \text{uplo} = 'L',$$

where *U* or *L* is a product of permutation and unit upper (lower) triangular matrices, and *D* is a symmetric and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

3. If some $D(i,i)=0$, so that *D* is exactly singular, the routine returns with *info* = *i*. Otherwise, the factored form of *A* is used to estimate the condition number of the matrix *A* (see the *rcond* parameter). If the reciprocal of the condition number is less than machine precision, the routine still goes on to solve for *X* and compute error bounds.
4. The system of equations is solved for *X* using the factored form of *A*.
5. By default, unless *params*(1) is set to zero, the routine applies iterative refinement to get a small error and error bounds. Refinement calculates the residual to at least twice the working precision.
6. If equilibration was used, the matrix *X* is premultiplied by $\text{diag}(r)$ so that it solves the original system before equilibration.

Input Parameters

<i>fact</i>	<p>CHARACTER*1. Must be 'F', 'N', or 'E'.</p> <p>Specifies whether or not the factored form of the matrix <i>A</i> is supplied on entry, and if not, whether the matrix <i>A</i> should be equilibrated before it is factored.</p> <p>If <i>fact</i> = 'F', on entry, <i>af</i> and <i>ipiv</i> contain the factored form of <i>A</i>. If <i>equed</i> is not 'N', the matrix <i>A</i> has been equilibrated with scaling factors given by <i>s</i>. Parameters <i>a</i>, <i>af</i>, and <i>ipiv</i> are not modified.</p> <p>If <i>fact</i> = 'N', the matrix <i>A</i> will be copied to <i>af</i> and factored.</p> <p>If <i>fact</i> = 'E', the matrix <i>A</i> will be equilibrated, if necessary, copied to <i>af</i> and factored.</p>
<i>uplo</i>	<p>CHARACTER*1. Must be 'U' or 'L'.</p> <p>Indicates whether the upper or lower triangular part of <i>A</i> is stored:</p> <p>If <i>uplo</i> = 'U', the upper triangle of <i>A</i> is stored.</p> <p>If <i>uplo</i> = 'L', the lower triangle of <i>A</i> is stored.</p>
<i>n</i>	<p>INTEGER. The number of linear equations; the order of the matrix <i>A</i>; $n \geq 0$.</p>
<i>nrhs</i>	<p>INTEGER. The number of right-hand sides; the number of columns of the matrices <i>B</i> and <i>X</i>; $nrhs \geq 0$.</p>

a, af, b, work

REAL for `ssysvxx`
 DOUBLE PRECISION for `dsysvxx`
 COMPLEX for `csysvxx`
 DOUBLE COMPLEX for `zsysvxx`.

Arrays: *a*(size *lda* by *), *af*(size *ldaf* by *), *b*(size *ldb*, *), *work*(*).

The array *a* contains the symmetric matrix *A* as specified by *uplo*. If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of *a* contains the upper triangular part of the matrix *A* and the strictly lower triangular part of *a* is not referenced. If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of *a* contains the lower triangular part of the matrix *A* and the strictly upper triangular part of *a* is not referenced. The second dimension of *a* must be at least $\max(1, n)$.

The array *af* is an input argument if *fact* = 'F'. It contains the block diagonal matrix *D* and the multipliers used to obtain the factor *U* and *L* from the factorization $A = U^*D^*U^T$ or $A = L^*D^*L^T$ as computed by `?sytrf`. The second dimension of *af* must be at least $\max(1, n)$.

The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least $\max(1, nrhs)$.

work(*) is a workspace array. The dimension of *work* must be at least $\max(1, 4*n)$ for real flavors, and at least $\max(1, 2*n)$ for complex flavors.

lda

INTEGER. The leading dimension of the array *a*; $lda \geq \max(1, n)$.

ldaf

INTEGER. The leading dimension of the array *af*; $ldaf \geq \max(1, n)$.

ipiv

INTEGER.

Array, size at least $\max(1, n)$. The array *ipiv* is an input argument if *fact* = 'F'. It contains details of the interchanges and the block structure of *D* as determined by `?sytrf`. If *ipiv*(*k*) > 0, rows and columns *k* and *ipiv*(*k*) were interchanged and *D*(*k*,*k*) is a 1-by-1 diagonal block.

If *uplo* = 'U' and *ipiv*(*k*) = *ipiv*(*k*-1) < 0, rows and columns *k*-1 and -*ipiv*(*k*) were interchanged and *D*(*k*-1:*k*, *k*-1:*k*) is a 2-by-2 diagonal block.

If *uplo* = 'L' and *ipiv*(*k*) = *ipiv*(*k*+1) < 0, rows and columns *k*+1 and -*ipiv*(*k*) were interchanged and *D*(*k*:*k*+1, *k*:*k*+1) is a 2-by-2 diagonal block.

equed

CHARACTER*1. Must be 'N' or 'Y'.

equed is an input argument if *fact* = 'F'. It specifies the form of equilibration that was done:

If *equed* = 'N', no equilibration was done (always true if *fact* = 'N').

if *equed* = 'Y', both row and column equilibration was done, that is, *A* has been replaced by *diag*(*s*)**A***diag*(*s*).

s

REAL for single precision flavors
 DOUBLE PRECISION for double precision flavors.

Array, size (n). The array s contains the scale factors for A . If $equed = 'Y'$, A is multiplied on the left and right by $\text{diag}(s)$.

This array is an input argument if $fact = 'F'$ only; otherwise it is an output argument.

If $fact = 'F'$ and $equed = 'Y'$, each element of s must be positive.

Each element of s should be a power of the radix to ensure a reliable solution and error estimates. Scaling by powers of the radix does not cause rounding errors unless the result underflows or overflows. Rounding errors during scaling lead to refining with a matrix that is not equivalent to the input matrix, producing error estimates that may not be reliable.

<i>ldb</i>	INTEGER. The leading dimension of the array b ; $ldb \geq \max(1, n)$.
<i>ldx</i>	INTEGER. The leading dimension of the output array x ; $ldx \geq \max(1, n)$.
<i>n_err_bnds</i>	INTEGER. Number of error bounds to return for each right hand side and each type (normwise or componentwise). See <i>err_bnds_norm</i> and <i>err_bnds_comp</i> descriptions in the <i>Output Arguments</i> section below.
<i>nparams</i>	INTEGER. Specifies the number of parameters set in <i>params</i> . If ≤ 0 , the <i>params</i> array is never referenced and default values are used.
<i>params</i>	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Array, size <i>nparams</i> . Specifies algorithm parameters. If an entry is less than 0.0, that entry is filled with the default value used for that parameter. Only positions up to <i>nparams</i> are accessed; defaults are used for higher-numbered parameters. If defaults are acceptable, you can pass <i>nparams</i> = 0, which prevents the source code from accessing the <i>params</i> argument. <i>params</i> (1) : Whether to perform iterative refinement or not. Default: 1.0 (for single precision flavors), 1.0D+0 (for double precision flavors). =0.0 No refinement is performed and no error bounds are computed. =1.0 Use the extra-precise refinement algorithm. (Other values are reserved for future use.) <i>params</i> (2) : Maximum number of residual computations allowed for refinement. Default 10.0 Aggressive Set to 100.0 to permit convergence using approximate factorizations or factorizations other than <i>LU</i> . If the factorization uses a technique other than Gaussian elimination, the guarantees in <i>err_bnds_norm</i> and <i>err_bnds_comp</i> may no longer be trustworthy.

params(3) : Flag determining if the code will attempt to find a solution with a small componentwise relative error in the double-precision algorithm. Positive is true, 0.0 is false. Default: 1.0 (attempt componentwise convergence).

iwork INTEGER. Workspace array, size at least $\max(1, n)$; used in real flavors only.

rwork REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Workspace array, size at least $\max(1, 3*n)$; used in complex flavors only.

Output Parameters

x REAL for *ssysvxx*

DOUBLE PRECISION for *dsysvxx*

COMPLEX for *csysvxx*

DOUBLE COMPLEX for *zsysvxx*.

Array, size *ldx* by *nrhs*).

If *info* = 0, the array *x* contains the solution *n*-by-*nrhs* matrix *X* to the original system of equations. Note that *A* and *B* are modified on exit if *equed* ≠ 'N', and the solution to the equilibrated system is:

$\text{inv}(\text{diag}(s)) * X$.

a If *fact* = 'E' and *equed* = 'Y', overwritten by $\text{diag}(s) * A * \text{diag}(s)$.

af If *fact* = 'N', *af* is an output argument and on exit returns the block diagonal matrix *D* and the multipliers used to obtain the factor *U* or *L* from the factorization $A = U * D * U^T$ or $A = L * D * L^T$.

b If *equed* = 'N', *B* is not modified.

If *equed* = 'Y', *B* is overwritten by $\text{diag}(s) * B$.

s This array is an output argument if *fact* ≠ 'F'. Each element of this array is a power of the radix. See the description of *s* in *Input Arguments* section.

rcond REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Reciprocal scaled condition number. An estimate of the reciprocal Skeel condition number of the matrix *A* after equilibration (if done). If *rcond* is less than the machine precision, in particular, if *rcond* = 0, the matrix is singular to working precision. Note that the error may still be small even if this number is very small and the matrix appears ill-conditioned.

rpvgrw REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Contains the reciprocal pivot growth factor:

$$\|A\|/\|U\|$$

If this is much less than 1, the stability of the *LU* factorization of the (equilibrated) matrix *A* could be poor. This also means that the solution *X*, estimated condition numbers, and error bounds could be unreliable. If factorization fails with $0 < info \leq n$, this parameter contains the reciprocal pivot growth factor for the leading *info* columns of *A*.

berr

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, size at least $\max(1, nrhs)$. Contains the componentwise relative backward error for each solution vector $x(j)$, that is, the smallest relative change in any element of *A* or *B* that makes $x(j)$ an exact solution.

err_bnds_norm

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array of size *nrhs* by *n_err_bnds*. For each right-hand side, contains information about various error bounds and condition numbers corresponding to the normwise relative error, which is defined as follows:

Normwise relative error in the *i*-th solution vector

$$\frac{\max_j |X_{true_{ji}} - X_{ji}|}{\max_j |X_{ji}|}$$

The array is indexed by the type of error information as described below. Up to three pieces of information are returned.

The first index in *err_bnds_norm*(*i*, :) corresponds to the *i*-th right-hand side.

The second index in *err_bnds_norm*(:, *err*) contains the following three fields:

err=1

"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold $\sqrt{n} * slamch(\epsilon)$ for single precision flavors and $\sqrt{n} * dlamch(\epsilon)$ for double precision flavors.

err=2

"Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold $\sqrt{n} * slamch(\epsilon)$ for single precision flavors and $\sqrt{n} * dlamch(\epsilon)$ for double precision flavors. This error bound should only be trusted if the previous boolean is true.

err=3

Reciprocal condition number. Estimated normwise reciprocal condition number. Compared with the threshold $\sqrt{n} * slamch(\epsilon)$ for single precision flavors

and $\sqrt{n} * dlamch(\epsilon)$ for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix Z are:

$$\|Z\|_{\infty} \cdot \|Z^{-1}\|_{\infty}$$

Let $z = s * a$, where s scales each row by a power of the radix so all absolute row sums of z are approximately 1.

err_bnds_comp

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array of size *nrhs* by *n_err_bnds*. For each right-hand side, contains information about various error bounds and condition numbers corresponding to the componentwise relative error, which is defined as follows:

Componentwise relative error in the i -th solution vector:

$$\max_j \frac{|X_{true_{ji}} - X_{ji}|}{|X_{ji}|}$$

The array is indexed by the right-hand side i , on which the componentwise relative error depends, and by the type of error information as described below. There are currently up to three pieces of information returned for each right-hand side. If componentwise accuracy is not requested ($params(3) = 0.0$), then *err_bnds_comp* is not accessed. If *n_err_bnds* < 3, then at most the first ($(:, n_err_bnds)$) entries are returned.

The first index in *err_bnds_comp*($i, :$) corresponds to the i -th right-hand side.

The second index in *err_bnds_comp*($(:, err)$) contains the following three fields:

err=1

"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold $\sqrt{n} * slamch(\epsilon)$ for single precision flavors and $\sqrt{n} * dlamch(\epsilon)$ for double precision flavors.

err=2

"Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold $\sqrt{n} * slamch(\epsilon)$ for single precision flavors and $\sqrt{n} * dlamch(\epsilon)$ for double precision flavors. This error bound should only be trusted if the previous boolean is true.

err=3

Reciprocal condition number. Estimated componentwise reciprocal condition number. Compared with the threshold $\sqrt{n} * \text{slamch}(\epsilon)$ for single precision flavors and $\sqrt{n} * \text{dlamch}(\epsilon)$ for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix Z are:

$$\|Z\|_{\infty} \cdot \|Z^{-1}\|_{\infty}$$

Let $z = s * (a * \text{diag}(x))$, where x is the solution for the current right-hand side and s scales each row of $a * \text{diag}(x)$ by a power of the radix so all absolute row sums of z are approximately 1.

ipiv

If *fact* = 'N', *ipiv* is an output argument and on exit contains details of the interchanges and the block structure D , as determined by [ssytrf](#) for single precision flavors and [dsytrf](#) for double precision flavors.

equed

If *fact* ≠ 'F', then *equed* is an output argument. It specifies the form of equilibration that was done (see the description of *equed* in *Input Arguments* section).

params

If an entry is less than 0.0, that entry is filled with the default value used for that parameter, otherwise the entry is not modified.

info

INTEGER. If *info* = 0, the execution is successful. The solution to every right-hand side is guaranteed.

If *info* = $-i$, the i -th parameter had an illegal value.

If $0 < \text{info} \leq n$: $U(\text{info}, \text{info})$ is exactly zero. The factorization has been completed, but the factor U is exactly singular, so the solution and error bounds could not be computed; *rcond* = 0 is returned.

If *info* = $n+j$: The solution corresponding to the j -th right-hand side is not guaranteed. The solutions corresponding to other right-hand sides k with $k > j$ may not be guaranteed as well, but only the first such right-hand side is reported. If a small componentwise error is not requested *params*(3) = 0.0, then the j -th right-hand side is the first with a normwise error bound that is not guaranteed (the smallest j such that $\text{err_bnds_norm}(j, 1) = 0.0$ or $\text{err_bnds_comp}(j, 1) = 0.0$. See the definition of *err_bnds_norm* and *err_bnds_comp* for *err* = 1. To get information about all of the right-hand sides, check *err_bnds_norm* or *err_bnds_comp*.

Description

The routine solves for X the complex system of linear equations $A^*X = B$, where A is an n -by- n symmetric matrix, the columns of matrix B are individual right-hand sides, and the columns of X are the corresponding solutions.

The diagonal pivoting method is used to factor A as $A = U^*D^*U^H$ or $A = L^*D^*L^H$, where U (or L) is a product of permutation and unit upper (lower) triangular matrices, and D is Hermitian and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

The factored form of A is then used to solve the system of equations $A^*X = B$.

Input Parameters

<i>uplo</i>	<p>CHARACTER*1. Must be 'U' or 'L'.</p> <p>Indicates whether the upper or lower triangular part of A is stored and how A is factored:</p> <p>If <i>uplo</i> = 'U', the array <i>a</i> stores the upper triangular part of the matrix A, and A is factored as $U^*D^*U^H$.</p> <p>If <i>uplo</i> = 'L', the array <i>a</i> stores the lower triangular part of the matrix A, and A is factored as $L^*D^*L^H$.</p>
<i>n</i>	<p>INTEGER. The order of matrix A; $n \geq 0$.</p>
<i>nrhs</i>	<p>INTEGER. The number of right-hand sides, the number of columns in B; $nrhs \geq 0$.</p>
<i>a, b, work</i>	<p>COMPLEX for chesv</p> <p>DOUBLE COMPLEX for zhesv.</p> <p>Arrays: <i>a</i>(size <i>lda</i> by *), <i>bb</i>(size <i>ldb</i> by *), <i>work</i>(*). The array <i>a</i> contains the upper or the lower triangular part of the Hermitian matrix A (see <i>uplo</i>). The second dimension of <i>a</i> must be at least $\max(1, n)$.</p> <p>The array <i>b</i> contains the matrix B whose columns are the right-hand sides for the systems of equations. The second dimension of <i>b</i> must be at least $\max(1, nrhs)$.</p> <p><i>work</i> is a workspace array, dimension at least $\max(1, lwork)$.</p>
<i>lda</i>	<p>INTEGER. The leading dimension of <i>a</i>; $lda \geq \max(1, n)$.</p>
<i>ldb</i>	<p>INTEGER. The leading dimension of <i>b</i>; $ldb \geq \max(1, n)$.</p>
<i>lwork</i>	<p>INTEGER. The size of the <i>work</i> array (<i>lwork</i> ≥ 1).</p>

If $lwork = -1$, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by `xerbla`. See *Application Notes* below for details and for the suggested value of *lwork*.

Output Parameters

<i>a</i>	If $info = 0$, <i>a</i> is overwritten by the block-diagonal matrix <i>D</i> and the multipliers used to obtain the factor <i>U</i> (or <i>L</i>) from the factorization of <i>A</i> as computed by ?hetrf .
<i>b</i>	If $info = 0$, <i>b</i> is overwritten by the solution matrix <i>X</i> .
<i>ipiv</i>	INTEGER. Array, size at least $\max(1, n)$. Contains details of the interchanges and the block structure of <i>D</i> , as determined by ?hetrf . If $ipiv(i) = k > 0$, then d_{ii} is a 1-by-1 diagonal block, and the <i>i</i> -th row and column of <i>A</i> was interchanged with the <i>k</i> -th row and column. If $uplo = 'U'$ and $ipiv(i) = ipiv(i-1) = -m < 0$, then <i>D</i> has a 2-by-2 block in rows/columns <i>i</i> and <i>i-1</i> , and (<i>i-1</i>)-th row and column of <i>A</i> was interchanged with the <i>m</i> -th row and column. If $uplo = 'L'$ and $ipiv(i) = ipiv(i+1) = -m < 0$, then <i>D</i> has a 2-by-2 block in rows/columns <i>i</i> and <i>i+1</i> , and (<i>i+1</i>)-th row and column of <i>A</i> was interchanged with the <i>m</i> -th row and column.
<i>work</i> (1)	If $info = 0$, on exit <i>work</i> (1) contains the minimum value of <i>lwork</i> required for optimum performance. Use this <i>lwork</i> for subsequent runs.
<i>info</i>	INTEGER. If $info = 0$, the execution is successful. If $info = -i$, the <i>i</i> -th parameter had an illegal value. If $info = i$, d_{ii} is 0. The factorization has been completed, but <i>D</i> is exactly singular, so the solution could not be computed.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `hesv` interface are as follows:

<i>a</i>	Holds the matrix <i>A</i> of size (n, n) .
<i>b</i>	Holds the matrix <i>B</i> of size $(n, nrhs)$.
<i>ipiv</i>	Holds the vector of length <i>n</i> .
<i>uplo</i>	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

For better performance, try using $lwork = n * blocksize$, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set $lwork = -1$.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set $lwork = -1$, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?hesv_rook

Computes the solution to the system of linear equations for Hermitian matrices using the bounded Bunch-Kaufman diagonal pivoting method.

Syntax

```
call chesv_rook( uplo, n, nrhs, a, lda, ipiv, b, ldb, work, lwork, info )
call zhesv_rook( uplo, n, nrhs, a, lda, ipiv, b, ldb, work, lwork, info )
call hesv_rook( a, b [,uplo] [,ipiv] [,info] )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine solves for *X* the complex system of linear equations $A * X = B$, where *A* is an *n*-by-*n* Hermitian matrix, and *X* and *B* are *n*-by-*nrhs* matrices.

The bounded Bunch-Kaufman ("rook") diagonal pivoting method is used to factor *A* as

$A = U * D * U^H$ if *uplo* = 'U', or

$A = L * D * L^H$ if *uplo* = 'L',

where *U* (or *L*) is a product of permutation and unit upper (lower) triangular matrices, and *D* is Hermitian and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

[hetrf_rook](#) is called to compute the factorization of a complex Hermitian matrix *A* using the bounded Bunch-Kaufman ("rook") diagonal pivoting method.

The factored form of *A* is then used to solve the system of equations $A * X = B$ by calling ?HETRS_ROOK, which uses BLAS level 2 routines.

Input Parameters

<i>uplo</i>	CHARACTER*1. Must be 'U' or 'L'.
	Indicates whether the upper or lower triangular part of <i>A</i> is stored:

If *uplo* = 'U', the array *a* stores the upper triangular part of the matrix *A*.

If *uplo* = 'L', the array *a* stores the lower triangular part of the matrix *A*.

n INTEGER. The number of linear equations, which is the order of matrix *A*; $n \geq 0$.

nrhs INTEGER. The number of right-hand sides, the number of columns in *B*; $nrhs \geq 0$.

a, *b*, *work* COMPLEX for *chesv_rook*
COMPLEX*16 for *zhesv_rook*.

Arrays: *a*(size *lda* by *), *b*(size *ldb* by *), *work*(*).

The array *a* contains the Hermitian matrix *A*. If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of *a* contains the upper triangular part of the matrix *A*, and the strictly lower triangular part of *a* is not referenced. If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of *a* contains the lower triangular part of the matrix *A*, and the strictly upper triangular part of *a* is not referenced. The second dimension of *a* must be at least $\max(1, n)$.

The array *b* contains the *n*-by-*nrhs* right hand side matrix *B*. The second dimension of *b* must be at least $\max(1, nrhs)$.

work is a workspace array, dimension at least $\max(1, lwork)$.

lda INTEGER. The leading dimension of *a*; $lda \geq \max(1, n)$.

ldb INTEGER. The leading dimension of *b*; $ldb \geq \max(1, n)$.

lwork INTEGER. The size of the *work* array ($lwork \geq 1$).

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by *xerbla*. See *Application Notes* below for details and for the suggested value of *lwork*.

Output Parameters

a If *info* = 0, *a* is overwritten by the block-diagonal matrix *D* and the multipliers used to obtain the factor *U* (or *L*) from the factorization of *A* as computed by [hetrf_rook](#).

b If *info* = 0, *b* is overwritten by the *n*-by-*nrhs* solution matrix *X*.

ipiv INTEGER.

Array, size at least $\max(1, n)$. Contains details of the interchanges and the block structure of *D*, as determined by [?hetrf_rook](#).

- If *uplo* = 'U':

If $ipiv(k) > 0$, rows and columns k and $ipiv(k)$ were interchanged and $D_{k,k}$ is a 1-by-1 diagonal block.

If $ipiv(k) < 0$ and $ipiv(k - 1) < 0$, rows and columns k and $-ipiv(k)$ were interchanged, rows and columns $k - 1$ and $-ipiv(k - 1)$ were interchanged, and $D_{k-1:k, k-1:k}$ is a 2-by-2 diagonal block.

- If $uplo = 'L'$:

If $ipiv(k) > 0$, rows and columns k and $ipiv(k)$ were interchanged and $D_{k,k}$ is a 1-by-1 diagonal block.

If $ipiv(k) < 0$ and $ipiv(k + 1) < 0$, rows and columns k and $-ipiv(k)$ were interchanged, rows and columns $k + 1$ and $-ipiv(k + 1)$ were interchanged, and $D_{k:k+1, k:k+1}$ is a 2-by-2 diagonal block.

`work(1)`

If $info = 0$, on exit `work(1)` contains the minimum value of $lwork$ required for optimum performance. Use this $lwork$ for subsequent runs.

`info`

INTEGER. If $info = 0$, the execution is successful.

If $info = -i$, the i -th parameter had an illegal value.

If $info = i$, D_{ii} is 0. The factorization has been completed, but D is exactly singular, so the solution could not be computed.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `hesv_rook` interface are as follows:

<code>a</code>	Holds the matrix A of size (n, n) .

```

```
call hesvx( a, b, x [,uplo] [,af] [,ipiv] [,fact] [,ferr] [,berr] [,rcond] [,info] )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine uses the diagonal pivoting factorization to compute the solution to a complex system of linear equations $A^*X = B$, where A is an n -by- n Hermitian matrix, the columns of matrix B are individual right-hand sides, and the columns of X are the corresponding solutions.

Error bounds on the solution and a condition estimate are also provided.

The routine ?hesvx performs the following steps:

1. If $fact = 'N'$, the diagonal pivoting method is used to factor the matrix A . The form of the factorization is $A = U^*D^*U^H$ or $A = L^*D^*L^H$, where U (or L) is a product of permutation and unit upper (lower) triangular matrices, and D is Hermitian and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.
2. If some $d_{i,i} = 0$, so that D is exactly singular, then the routine returns with $info = i$. Otherwise, the factored form of A is used to estimate the condition number of the matrix A . If the reciprocal of the condition number is less than machine precision, $info = n+1$ is returned as a warning, but the routine still goes on to solve for X and compute error bounds as described below.
3. The system of equations is solved for X using the factored form of A .
4. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.

Input Parameters

<i>fact</i>	<p>CHARACTER*1. Must be 'F' or 'N'.</p> <p>Specifies whether or not the factored form of the matrix A has been supplied on entry.</p> <p>If $fact = 'F'$: on entry, af and $ipiv$ contain the factored form of A. Arrays a, af, and $ipiv$ are not modified.</p> <p>If $fact = 'N'$, the matrix A is copied to af and factored.</p>
<i>uplo</i>	<p>CHARACTER*1. Must be 'U' or 'L'.</p> <p>Indicates whether the upper or lower triangular part of A is stored and how A is factored:</p> <p>If $uplo = 'U'$, the array a stores the upper triangular part of the Hermitian matrix A, and A is factored as $U^*D^*U^H$.</p> <p>If $uplo = 'L'$, the array a stores the lower triangular part of the Hermitian matrix A; A is factored as $L^*D^*L^H$.</p>
<i>n</i>	<p>INTEGER. The order of matrix A; $n \geq 0$.</p>
<i>nrhs</i>	<p>INTEGER. The number of right-hand sides, the number of columns in B; $nrhs \geq 0$.</p>
<i>a</i> , <i>af</i> , <i>b</i> , <i>work</i>	<p>COMPLEX for chesvx</p> <p>DOUBLE COMPLEX for zhesvx.</p> <p>Arrays: a(size lda by *), af(size $ldaf$ by *), b(size ldb by *), $work$(*).</p>

The array *a* contains the upper or the lower triangular part of the Hermitian matrix *A* (see *uplo*). The second dimension of *a* must be at least $\max(1, n)$.

The array *af* is an input argument if *fact* = 'F'. It contains the block diagonal matrix *D* and the multipliers used to obtain the factor *U* or *L* from the factorization $A = U^*D^*U^H$ or $A = L^*D^*L^H$ as computed by [?hetrf](#). The second dimension of *af* must be at least $\max(1, n)$.

The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least $\max(1, nrhs)$.

work(*) is a workspace array of dimension at least $\max(1, lwork)$.

lda INTEGER. The leading dimension of *a*; $lda \geq \max(1, n)$.

ldaf INTEGER. The leading dimension of *af*; $ldaf \geq \max(1, n)$.

ldb INTEGER. The leading dimension of *b*; $ldb \geq \max(1, n)$.

ipiv INTEGER.

Array, size at least $\max(1, n)$. The array *ipiv* is an input argument if *fact* = 'F'. It contains details of the interchanges and the block structure of *D*, as determined by [?hetrf](#).

If $ipiv(i) = k > 0$, then d_{ii} is a 1-by-1 diagonal block, and the *i*-th row and column of *A* was interchanged with the *k*-th row and column.

If *uplo* = 'U' and $ipiv(i) = ipiv(i-1) = -m < 0$, then *D* has a 2-by-2 block in rows/columns *i* and *i-1*, and (*i-1*)-th row and column of *A* was interchanged with the *m*-th row and column.

If *uplo* = 'L' and $ipiv(i) = ipiv(i+1) = -m < 0$, then *D* has a 2-by-2 block in rows/columns *i* and *i+1*, and (*i+1*)-th row and column of *A* was interchanged with the *m*-th row and column.

ldx INTEGER. The leading dimension of the output array *x*; $ldx \geq \max(1, n)$.

lwork INTEGER. The size of the *work* array.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by `xerbla`. See *Application Notes* below for details and for the suggested value of *lwork*.

rwork REAL for `chesvx`

DOUBLE PRECISION for `zhesvx`.

Workspace array, size at least $\max(1, n)$.

Output Parameters

x COMPLEX for `chesvx`

DOUBLE COMPLEX for `zhesvx`.

Array, size ldx by $*$.

If $info = 0$ or $info = n+1$, the array x contains the solution matrix X to the system of equations. The second dimension of x must be at least $\max(1, nrhs)$.

af, ipiv

These arrays are output arguments if $fact = 'N'$. See the description of *af, ipiv* in *Input Arguments* section.

rcond

REAL for *chesvx*

DOUBLE PRECISION for *zhesvx*.

An estimate of the reciprocal condition number of the matrix A . If *rcond* is less than the machine precision (in particular, if $rcond = 0$), the matrix is singular to working precision. This condition is indicated by a return code of $info > 0$.

ferr

REAL for *chesvx*

DOUBLE PRECISION for *zhesvx*.

Array, size at least $\max(1, nrhs)$. Contains the estimated forward error bound for each solution vector $x(j)$ (the j -th column of the solution matrix X). If $xtrue$ is the true solution corresponding to $x(j)$, $ferr(j)$ is an estimated upper bound for the magnitude of the largest element in $(x(j) - xtrue)$ divided by the magnitude of the largest element in $x(j)$. The estimate is as reliable as the estimate for *rcond*, and is almost always a slight overestimate of the true error.

berr

REAL for *chesvx*

DOUBLE PRECISION for *zhesvx*.

Array, size at least $\max(1, nrhs)$. Contains the component-wise relative backward error for each solution vector $x(j)$, that is, the smallest relative change in any element of A or B that makes $x(j)$ an exact solution.

work(1)

If $info = 0$, on exit *work(1)* contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

info

INTEGER. If $info = 0$, the execution is successful.

If $info = -i$, the i -th parameter had an illegal value.

If $info = i$, and $i \leq n$, then d_{ii} is exactly zero. The factorization has been completed, but the block diagonal matrix D is exactly singular, so the solution and error bounds could not be computed; $rcond = 0$ is returned.

If $info = i$, and $i = n + 1$, then D is nonsingular, but *rcond* is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of *rcond* would suggest.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `hesvx` interface are as follows:

<code>a</code>	Holds the matrix A of size (n, n) .
<code>b</code>	Holds the matrix B of size $(n, nrhs)$.
<code>x</code>	Holds the matrix X of size $(n, nrhs)$.
<code>af</code>	Holds the matrix AF of size (n, n) .
<code>ipiv</code>	Holds the vector of length n .
<code>ferr</code>	Holds the vector of length $(nrhs)$.
<code>berr</code>	Holds the vector of length $(nrhs)$.
<code>uplo</code>	Must be 'U' or 'L'. The default value is 'U'.
<code>fact</code>	Must be 'N' or 'F'. The default value is 'N'. If <code>fact</code> = 'F', then both arguments <code>af</code> and <code>ipiv</code> must be present; otherwise, an error is returned.

Application Notes

The value of `lwork` must be at least $2*n$. For better performance, try using `lwork = n*blocksize`, where `blocksize` is the optimal block size for `?hetrf`.

If you are in doubt how much workspace to supply, use a generous value of `lwork` for the first run or set `lwork = -1`.

If you choose the first option and set any of admissible `lwork` sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array `work` on exit. Use this value (`work(1)`) for subsequent runs.

If you set `lwork = -1`, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (`work`). This operation is called a workspace query.

Note that if you set `lwork` to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

Description

The routine uses the *diagonal pivoting* factorization to compute the solution to a complex/double complex system of linear equations $A^*X = B$, where A is an n -by- n Hermitian matrix, the columns of matrix B are individual right-hand sides, and the columns of X are the corresponding solutions.

Both normwise and maximum componentwise error bounds are also provided on request. The routine returns a solution with a small guaranteed error ($O(\text{eps})$, where eps is the working machine precision) unless the matrix is very ill-conditioned, in which case a warning is returned. Relevant condition numbers are also calculated and returned.

The routine accepts user-provided factorizations and equilibration factors; see definitions of the *fact* and *equed* options. Solving with refinement and using a factorization from a previous call of the routine also produces a solution with $O(\text{eps})$ errors or warnings but that may not be true for general user-provided factorizations and equilibration factors if they differ from what the routine would itself produce.

The routine `?hesvxx` performs the following steps:

1. If *fact* = 'E', scaling factors are computed to equilibrate the system:

$$\text{diag}(s) * A * \text{diag}(s) * \text{inv}(\text{diag}(s)) * X = \text{diag}(s) * B$$

Whether or not the system will be equilibrated depends on the scaling of the matrix A , but if equilibration is used, A is overwritten by $\text{diag}(s) * A * \text{diag}(s)$ and B by $\text{diag}(s) * B$.

2. If *fact* = 'N' or 'E', the LU decomposition is used to factor the matrix A (after equilibration if *fact* = 'E') as

$$A = U * D * U^T, \text{ if } \text{uplo} = 'U',$$

$$\text{or } A = L * D * L^T, \text{ if } \text{uplo} = 'L',$$

where U or L is a product of permutation and unit upper (lower) triangular matrices, and D is a symmetric and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

3. If some $D(i, i) = 0$, so that D is exactly singular, the routine returns with *info* = i . Otherwise, the factored form of A is used to estimate the condition number of the matrix A (see the *rcond* parameter). If the reciprocal of the condition number is less than machine precision, the routine still goes on to solve for X and compute error bounds.
4. The system of equations is solved for X using the factored form of A .
5. By default, unless *params*(1) is set to zero, the routine applies iterative refinement to get a small error and error bounds. Refinement calculates the residual to at least twice the working precision.
6. If equilibration was used, the matrix X is premultiplied by $\text{diag}(r)$ so that it solves the original system before equilibration.

Input Parameters

fact CHARACTER*1. Must be 'F', 'N', or 'E'.

Specifies whether or not the factored form of the matrix A is supplied on entry, and if not, whether the matrix A should be equilibrated before it is factored.

If *fact* = 'F', on entry, *af* and *ipiv* contain the factored form of *A*. If *equed* is not 'N', the matrix *A* has been equilibrated with scaling factors given by *s*. Parameters *a*, *af*, and *ipiv* are not modified.

If *fact* = 'N', the matrix *A* will be copied to *af* and factored.

If *fact* = 'E', the matrix *A* will be equilibrated, if necessary, copied to *af* and factored.

uplo

CHARACTER*1. Must be 'U' or 'L'.

Indicates whether the upper or lower triangular part of *A* is stored:

If *uplo* = 'U', the upper triangle of *A* is stored.

If *uplo* = 'L', the lower triangle of *A* is stored.

n

INTEGER. The number of linear equations; the order of the matrix *A*; $n \geq 0$.

nrhs

INTEGER. The number of right-hand sides; the number of columns of the matrices *B* and *X*; $nrhs \geq 0$.

a, *af*, *b*, *work*

COMPLEX for *chesvxx*

DOUBLE COMPLEX for *zhesvxx*.

Arrays: *a*(size *lda* by *), *af*(size *ldaf* by *), *b*(*ldb*, *), *work*(*).

The array *a* contains the Hermitian matrix *A* as specified by *uplo*. If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of *a* contains the upper triangular part of the matrix *A* and the strictly lower triangular part of *a* is not referenced. If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of *a* contains the lower triangular part of the matrix *A* and the strictly upper triangular part of *a* is not referenced. The second dimension of *a* must be at least $\max(1, n)$.

The array *af* is an input argument if *fact* = 'F'. It contains the block diagonal matrix *D* and the multipliers used to obtain the factor *U* and *L* from the factorization $A = U^* D^* U^T$ or $A = L^* D^* L^T$ as computed by [?hetrf](#). The second dimension of *af* must be at least $\max(1, n)$.

The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least $\max(1, nrhs)$.

work(*) is a workspace array. The dimension of *work* must be at least $\max(1, 5*n)$.

lda

INTEGER. The leading dimension of the array *a*; $lda \geq \max(1, n)$.

ldaf

INTEGER. The leading dimension of the array *af*; $ldaf \geq \max(1, n)$.

ipiv

INTEGER.

Array, size at least $\max(1, n)$. The array *ipiv* is an input argument if *fact* = 'F'. It contains details of the interchanges and the block structure of *D* as determined by [?sytrf](#).

If *ipiv*(*k*) > 0, rows and columns *k* and *ipiv*(*k*) were interchanged and *D*(*k*,*k*) is a 1-by-1 diagonal block.

If $uplo = 'U'$ and $ipiv(k) = ipiv(k-1) < 0$, rows and columns $k-1$ and $-ipiv(k)$ were interchanged and $D(k-1:k, k-1:k)$ is a 2-by-2 diagonal block.

If $uplo = 'L'$ and $ipiv(k) = ipiv(k+1) < 0$, rows and columns $k+1$ and $-ipiv(k)$ were interchanged and $D(k:k+1, k:k+1)$ is a 2-by-2 diagonal block.

equed

CHARACTER*1. Must be 'N' or 'Y'.

equed is an input argument if *fact* = 'F'. It specifies the form of equilibration that was done:

If *equed* = 'N', no equilibration was done (always true if *fact* = 'N').

if *equed* = 'Y', both row and column equilibration was done, that is, *A* has been replaced by $diag(s) * A * diag(s)$.

s

REAL for *chesvxx*

DOUBLE PRECISION for *zhesvxx*.

Array, size (*n*). The array *s* contains the scale factors for *A*. If *equed* = 'Y', *A* is multiplied on the left and right by $diag(s)$.

This array is an input argument if *fact* = 'F' only; otherwise it is an output argument.

If *fact* = 'F' and *equed* = 'Y', each element of *s* must be positive.

Each element of *s* should be a power of the radix to ensure a reliable solution and error estimates. Scaling by powers of the radix does not cause rounding errors unless the result underflows or overflows. Rounding errors during scaling lead to refining with a matrix that is not equivalent to the input matrix, producing error estimates that may not be reliable.

ldb

INTEGER. The leading dimension of the array *b*; $ldb \geq \max(1, n)$.

ldx

INTEGER. The leading dimension of the output array *x*; $ldx \geq \max(1, n)$.

n_err_bnds

INTEGER. Number of error bounds to return for each right hand side and each type (normwise or componentwise). See *err_bnds_norm* and *err_bnds_comp* descriptions in the *Output Arguments* section below.

nparams

INTEGER. Specifies the number of parameters set in *params*. If ≤ 0 , the *params* array is never referenced and default values are used.

params

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, size *nparams*. Specifies algorithm parameters. If an entry is less than 0.0, that entry is filled with the default value used for that parameter. Only positions up to *nparams* are accessed; defaults are used for higher-numbered parameters. If defaults are acceptable, you can pass *nparams* = 0, which prevents the source code from accessing the *params* argument.

params(1) : Whether to perform iterative refinement or not. Default: 1.0 (for single precision flavors), 1.0D+0 (for double precision flavors).

=0.0 No refinement is performed and no error bounds are computed.

=1.0 Use the extra-precise refinement algorithm.

(Other values are reserved for future use.)

params(2) : Maximum number of residual computations allowed for refinement.

Default 10

Aggressive Set to 100 to permit convergence using approximate factorizations or factorizations other than *LU*. If the factorization uses a technique other than Gaussian elimination, the guarantees in *err_bnds_norm* and *err_bnds_comp* may no longer be trustworthy.

params(3) : Flag determining if the code will attempt to find a solution with a small componentwise relative error in the double-precision algorithm. Positive is true, 0.0 is false. Default: 1.0 (attempt componentwise convergence).

rwork

REAL for *chesvxx*

DOUBLE PRECISION for *zhesvxx*.

Workspace array, size at least $\max(1, 3*n)$; used in complex flavors only.

Output Parameters

x

COMPLEX for *chesvxx*

DOUBLE COMPLEX for *zhesvxx*.

Array, size *ldx* by *nrhs*.

If *info* = 0, the array *x* contains the solution *n*-by-*nrhs* matrix *X* to the original system of equations. Note that *A* and *B* are modified on exit if *equed* ≠ 'N', and the solution to the equilibrated system is:

$\text{inv}(\text{diag}(s)) * X$.

a

If *fact* = 'E' and *equed* = 'Y', overwritten by $\text{diag}(s) * A * \text{diag}(s)$.

af

If *fact* = 'N', *af* is an output argument and on exit returns the block diagonal matrix *D* and the multipliers used to obtain the factor *U* or *L* from the factorization $A = U * D * U^T$ or $A = L * D * L^T$.

b

If *equed* = 'N', *B* is not modified.

If *equed* = 'Y', *B* is overwritten by $\text{diag}(s) * B$.

s

This array is an output argument if *fact* ≠ 'F'. Each element of this array is a power of the radix. See the description of *s* in *Input Arguments* section.

rcond

REAL for *chesvxx*

DOUBLE PRECISION for zhesvxx.

Reciprocal scaled condition number. An estimate of the reciprocal Skeel condition number of the matrix A after equilibration (if done). If $rcond$ is less than the machine precision, in particular, if $rcond = 0$, the matrix is singular to working precision. Note that the error may still be small even if this number is very small and the matrix appears ill-conditioned.

rpvgrw

REAL for chesvxx

DOUBLE PRECISION for zhesvxx.

Contains the reciprocal pivot growth factor:

$$\|A\|/\|U\|$$

If this is much less than 1, the stability of the LU factorization of the (equilibrated) matrix A could be poor. This also means that the solution X , estimated condition numbers, and error bounds could be unreliable. If factorization fails with $0 < info \leq n$, this parameter contains the reciprocal pivot growth factor for the leading $info$ columns of A .

berr

REAL for chesvxx

DOUBLE PRECISION for zhesvxx.

Array, size at least $\max(1, nrhs)$. Contains the component-wise relative backward error for each solution vector $x(j)$, that is, the smallest relative change in any element of A or B that makes $x(j)$ an exact solution.

err_bnds_norm

REAL for chesvxx

DOUBLE PRECISION for zhesvxx.

Array of size $nrhs$ by n_err_bnds . For each right-hand side, contains information about various error bounds and condition numbers corresponding to the normwise relative error, which is defined as follows:

Normwise relative error in the i -th solution vector

$$\frac{\max_j |X_{true_{ji}} - X_{ji}|}{\max_j |X_{ji}|}$$

The array is indexed by the type of error information as described below. There are currently up to three pieces of information returned.

The first index in $err_bnds_norm(i, :)$ corresponds to the i -th right-hand side.

The second index in $err_bnds_norm(:, err)$ contains the following three fields:

err=1

"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold $\sqrt{n} * slamch(\epsilon)$ for chesvxx and $\sqrt{n} * dlamch(\epsilon)$ for zhesvxx.

`err=2` "Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold $\sqrt{n} * \text{slamch}(\epsilon)$ for `chesvxx` and $\sqrt{n} * \text{dlamch}(\epsilon)$ for `zhesvxx`. This error bound should only be trusted if the previous boolean is true.

`err=3` Reciprocal condition number. Estimated normwise reciprocal condition number. Compared with the threshold $\sqrt{n} * \text{slamch}(\epsilon)$ for `chesvxx` and $\sqrt{n} * \text{dlamch}(\epsilon)$ for `zhesvxx` to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix Z are:

$$\|Z\|_{\infty} \cdot \|Z^{-1}\|_{\infty}$$

Let $z = s * a$, where s scales each row by a power of the radix so all absolute row sums of z are approximately 1.

`err_bnds_comp`

REAL for `chesvxx`

DOUBLE PRECISION for `zhesvxx`.

Array of size `nrhs` by `n_err_bnds`. For each right-hand side, contains information about various error bounds and condition numbers corresponding to the componentwise relative error, which is defined as follows:

Componentwise relative error in the i -th solution vector:

$$\max_j \frac{|X_{true_{ji}} - X_{ji}|}{|X_{ji}|}$$

The array is indexed by the right-hand side i , on which the componentwise relative error depends, and by the type of error information as described below. There are currently up to three pieces of information returned for each right-hand side. If componentwise accuracy is not requested (`params(3) = 0.0`), then `err_bnds_comp` is not accessed. If `n_err_bnds < 3`, then at most the first `(:, n_err_bnds)` entries are returned.

The first index in `err_bnds_comp(i, :)` corresponds to the i -th right-hand side.

The second index in `err_bnds_comp(:, err)` contains the following three fields:

`err=1` "Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold $\sqrt{n} * \text{slamch}(\epsilon)$ for `chesvxx` and $\sqrt{n} * \text{dlamch}(\epsilon)$ for `zhesvxx`.

`err=2` "Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold $\sqrt{n} * \text{slamch}(\epsilon)$ for `chesvxx` and $\sqrt{n} * \text{dlamch}(\epsilon)$ for `zhesvxx`. This error bound should only be trusted if the previous boolean is true.

`err=3` Reciprocal condition number. Estimated componentwise reciprocal condition number. Compared with the threshold $\sqrt{n} * \text{slamch}(\epsilon)$ for `chesvxx` and $\sqrt{n} * \text{dlamch}(\epsilon)$ for `zhesvxx` to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix Z are:

$$\|Z\|_{\infty} \cdot \|Z^{-1}\|_{\infty}$$

Let $z = s * (a * \text{diag}(x))$, where x is the solution for the current right-hand side and s scales each row of $a * \text{diag}(x)$ by a power of the radix so all absolute row sums of z are approximately 1.

`ipiv` If `fact = 'N'`, `ipiv` is an output argument and on exit contains details of the interchanges and the block structure D , as determined by `ssytrf` for single precision flavors and `dsytrf` for double precision flavors.

`equed` If `fact ≠ 'F'`, then `equed` is an output argument. It specifies the form of equilibration that was done (see the description of `equed` in *Input Arguments* section).

`params` If an entry is less than 0.0, that entry is filled with the default value used for that parameter, otherwise the entry is not modified.

`info` INTEGER. If `info = 0`, the execution is successful. The solution to every right-hand side is guaranteed.

If `info = -i`, the i -th parameter had an illegal value.

If $0 < \text{info} \leq n$: $U(\text{info}, \text{info})$ is exactly zero. The factorization has been completed, but the factor U is exactly singular, so the solution and error bounds could not be computed; `rcond = 0` is returned.

If `info = n+j`: The solution corresponding to the j -th right-hand side is not guaranteed. The solutions corresponding to other right-hand sides k with $k > j$ may not be guaranteed as well, but only the first such right-hand side is reported. If a small componentwise error is not requested `params(3) = 0.0`, then the j -th right-hand side is the first with a normwise error bound that is not guaranteed (the smallest j such that `err_bnds_norm(j,1) = 0.0` or `err_bnds_comp(j,1) = 0.0`. See the definition of `err_bnds_norm` and `err_bnds_comp` for `err = 1`. To get information about all of the right-hand sides, check `err_bnds_norm` or `err_bnds_comp`.

Description

The routine solves for X the real or complex system of linear equations $A * X = B$, where A is an n -by- n symmetric matrix stored in packed format, the columns of matrix B are individual right-hand sides, and the columns of X are the corresponding solutions.

The diagonal pivoting method is used to factor A as $A = U * D * U^T$ or $A = L * D * L^T$, where U (or L) is a product of permutation and unit upper (lower) triangular matrices, and D is symmetric and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

The factored form of A is then used to solve the system of equations $A * X = B$.

Input Parameters

<i>uplo</i>	<p>CHARACTER*1. Must be 'U' or 'L'.</p> <p>Indicates whether the upper or lower triangular part of A is stored:</p> <p>If <i>uplo</i> = 'U', the upper triangle of A is stored.</p> <p>If <i>uplo</i> = 'L', the lower triangle of A is stored.</p>
<i>n</i>	<p>INTEGER. The order of matrix A; $n \geq 0$.</p>
<i>nrhs</i>	<p>INTEGER. The number of right-hand sides, the number of columns in B; $nrhs \geq 0$.</p>
<i>ap, b</i>	<p>REAL for sspsv</p> <p>DOUBLE PRECISION for dspsv</p> <p>COMPLEX for cspsv</p> <p>DOUBLE COMPLEX for zspsv.</p> <p>Arrays: <i>ap</i>(size *), <i>b</i>(size <i>ldb</i> by *).</p> <p>The dimension of <i>ap</i> must be at least $\max(1, n(n+1)/2)$. The array <i>ap</i> contains the factor U or L, as specified by <i>uplo</i>, in <i>packed storage</i> (see Matrix Storage Schemes).</p>

The array b contains the matrix B whose columns are the right-hand sides for the systems of equations. The second dimension of b must be at least $\max(1, nrhs)$.

ldb INTEGER. The leading dimension of b ; $ldb \geq \max(1, n)$.

Output Parameters

ap The block-diagonal matrix D and the multipliers used to obtain the factor U (or L) from the factorization of A as computed by [?sptf](#), stored as a packed triangular matrix in the same storage format as A .

b If $info = 0$, b is overwritten by the solution matrix X .

ipiv INTEGER.
Array, size at least $\max(1, n)$. Contains details of the interchanges and the block structure of D , as determined by [?sptf](#).
If $ipiv(i) = k > 0$, then d_{ii} is a 1-by-1 block, and the i -th row and column of A was interchanged with the k -th row and column.
If $uplo = 'U'$ and $ipiv(i) = ipiv(i-1) = -m < 0$, then D has a 2-by-2 block in rows/columns i and $i-1$, and $(i-1)$ -th row and column of A was interchanged with the m -th row and column.
If $uplo = 'L'$ and $ipiv(i) = ipiv(i+1) = -m < 0$, then D has a 2-by-2 block in rows/columns i and $i+1$, and $(i+1)$ -th row and column of A was interchanged with the m -th row and column.

info INTEGER. If $info = 0$, the execution is successful.
If $info = -i$, the i -th parameter had an illegal value.
If $info = i$, d_{ii} is 0. The factorization has been completed, but D is exactly singular, so the solution could not be computed.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `spsv` interface are as follows:

ap Holds the array A of size $(n*(n+1)/2)$.
b Holds the matrix B of size $(n, nrhs)$.
ipiv Holds the vector with the number of elements n .
uplo Must be 'U' or 'L'. The default value is 'U'.

Description

The routine uses the diagonal pivoting factorization to compute the solution to a real or complex system of linear equations $A \cdot X = B$, where A is a n -by- n symmetric matrix stored in packed format, the columns of matrix B are individual right-hand sides, and the columns of X are the corresponding solutions.

Error bounds on the solution and a condition estimate are also provided.

The routine ?spsvx performs the following steps:

1. If $fact = 'N'$, the diagonal pivoting method is used to factor the matrix A . The form of the factorization is $A = U \cdot D \cdot U^T$ or $A = L \cdot D \cdot L^T$, where U (or L) is a product of permutation and unit upper (lower) triangular matrices, and D is symmetric and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.
2. If some $d_{i,i} = 0$, so that D is exactly singular, then the routine returns with $info = i$. Otherwise, the factored form of A is used to estimate the condition number of the matrix A . If the reciprocal of the condition number is less than machine precision, $info = n+1$ is returned as a warning, but the routine still goes on to solve for X and compute error bounds as described below.
3. The system of equations is solved for X using the factored form of A .
4. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.

Input Parameters

fact

CHARACTER*1. Must be 'F' or 'N'.

Specifies whether or not the factored form of the matrix A has been supplied on entry.

If $fact = 'F'$: on entry, *afp* and *ipiv* contain the factored form of A . Arrays *ap*, *afp*, and *ipiv* are not modified.

If $fact = 'N'$, the matrix A is copied to *afp* and factored.

<i>uplo</i>	<p>CHARACTER*1. Must be 'U' or 'L'.</p> <p>Indicates whether the upper or lower triangular part of A is stored and how A is factored:</p> <p>If <i>uplo</i> = 'U', the array <i>ap</i> stores the upper triangular part of the symmetric matrix A, and A is factored as U^*D*U^T.</p> <p>If <i>uplo</i> = 'L', the array <i>ap</i> stores the lower triangular part of the symmetric matrix A; A is factored as L^*D*L^T.</p>
<i>n</i>	<p>INTEGER. The order of matrix A; $n \geq 0$.</p>
<i>nrhs</i>	<p>INTEGER. The number of right-hand sides, the number of columns in B; $nrhs \geq 0$.</p>
<i>ap, afp, b, work</i>	<p>REAL for sspsvx DOUBLE PRECISION for dpsvx COMPLEX for cspsvx DOUBLE COMPLEX for zpsvx.</p> <p>Arrays: <i>ap</i>(size *), <i>afp</i>(size *), <i>b</i>(size <i>ldb</i> by *), <i>work</i>(*).</p> <p>The array <i>ap</i> contains the upper or lower triangle of the symmetric matrix A in <i>packed storage</i> (see Matrix Storage Schemes).</p> <p>The array <i>afp</i> is an input argument if <i>fact</i> = 'F'. It contains the block diagonal matrix D and the multipliers used to obtain the factor U or L from the factorization $A = U^*D*U^T$ or $A = L^*D*L^T$ as computed by ?sptfrf, in the same storage format as A.</p> <p>The array <i>b</i> contains the matrix B whose columns are the right-hand sides for the systems of equations.</p> <p><i>work</i>(*) is a workspace array.</p> <p>The dimension of arrays <i>ap</i> and <i>afp</i> must be at least $\max(1, n(n+1)/2)$; the second dimension of <i>b</i> must be at least $\max(1, nrhs)$; the dimension of <i>work</i> must be at least $\max(1, 3*n)$ for real flavors and $\max(1, 2*n)$ for complex flavors.</p>
<i>ldb</i>	<p>INTEGER. The leading dimension of <i>b</i>; $ldb \geq \max(1, n)$.</p>
<i>ipiv</i>	<p>INTEGER.</p> <p>Array, size at least $\max(1, n)$. The array <i>ipiv</i> is an input argument if <i>fact</i> = 'F'. It contains details of the interchanges and the block structure of D, as determined by ?sptfrf.</p> <p>If <i>ipiv</i>(<i>i</i>) = <i>k</i> > 0, then d_{ii} is a 1-by-1 block, and the <i>i</i>-th row and column of A was interchanged with the <i>k</i>-th row and column.</p> <p>If <i>uplo</i> = 'U' and <i>ipiv</i>(<i>i</i>) = <i>ipiv</i>(<i>i</i>-1) = -<i>m</i> < 0, then D has a 2-by-2 block in rows/columns <i>i</i> and <i>i</i>-1, and (<i>i</i>-1)-th row and column of A was interchanged with the <i>m</i>-th row and column.</p> <p>If <i>uplo</i> = 'L' and <i>ipiv</i>(<i>i</i>) = <i>ipiv</i>(<i>i</i>+1) = -<i>m</i> < 0, then D has a 2-by-2 block in rows/columns <i>i</i> and <i>i</i>+1, and (<i>i</i>+1)-th row and column of A was interchanged with the <i>m</i>-th row and column.</p>

<i>ldx</i>	INTEGER. The leading dimension of the output array <i>x</i> ; $ldx \geq \max(1, n)$.
<i>iwork</i>	INTEGER. Workspace array, size at least $\max(1, n)$; used in real flavors only.
<i>rwork</i>	REAL for <i>cspsvx</i> DOUBLE PRECISION for <i>zspsvx</i> . Workspace array, size at least $\max(1, n)$; used in complex flavors only.

Output Parameters

<i>x</i>	REAL for <i>sspsvx</i> DOUBLE PRECISION for <i>dspsvx</i> COMPLEX for <i>cspsvx</i> DOUBLE COMPLEX for <i>zspsvx</i> . Array, size <i>ldx</i> by *. If <i>info</i> = 0 or <i>info</i> = <i>n</i> +1, the array <i>x</i> contains the solution matrix <i>X</i> to the system of equations. The second dimension of <i>x</i> must be at least $\max(1, nrhs)$.
<i>afp, ipiv</i>	These arrays are output arguments if <i>fact</i> = 'N'. See the description of <i>afp, ipiv</i> in <i>Input Arguments</i> section.
<i>rcond</i>	REAL for single precision flavors. DOUBLE PRECISION for double precision flavors. An estimate of the reciprocal condition number of the matrix <i>A</i> . If <i>rcond</i> is less than the machine precision (in particular, if <i>rcond</i> = 0), the matrix is singular to working precision. This condition is indicated by a return code of <i>info</i> > 0.
<i>ferr, berr</i>	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Arrays, size at least $\max(1, nrhs)$. Contain the component-wise forward and relative backward errors, respectively, for each solution vector.
<i>info</i>	INTEGER. If <i>info</i> = 0, the execution is successful. If <i>info</i> = - <i>i</i> , the <i>i</i> -th parameter had an illegal value. If <i>info</i> = <i>i</i> , and $i \leq n$, then d_{ii} is exactly zero. The factorization has been completed, but the block diagonal matrix <i>D</i> is exactly singular, so the solution and error bounds could not be computed; <i>rcond</i> = 0 is returned. If <i>info</i> = <i>i</i> , and $i = n + 1$, then <i>D</i> is nonsingular, but <i>rcond</i> is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are

computed because there are a number of situations where the computed solution can be more accurate than the value of *rcond* would suggest.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `spsvx` interface are as follows:

<i>ap</i>	Holds the array <i>A</i> of size $(n * (n+1) / 2)$.
<i>b</i>	Holds the matrix <i>B</i> of size $(n, nrhs)$.
<i>x</i>	Holds the matrix <i>X</i> of size $(n, nrhs)$.
<i>afp</i>	Holds the array <i>AF</i> of size $(n * (n+1) / 2)$.
<i>ipiv</i>	Holds the vector with the number of elements <i>n</i> .
<i>ferr</i>	Holds the vector with the number of elements <i>nrhs</i> .
<i>berr</i>	Holds the vector with the number of elements <i>nrhs</i> .
<i>uplo</i>	Must be 'U' or 'L'. The default value is 'U'.
<i>fact</i>	Must be 'N' or 'F'. The default value is 'N'. If <i>fact</i> = 'F', then both arguments <i>af</i> and <i>ipiv</i> must be present; otherwise, an error is returned.

Description

The routine solves for *X* the system of linear equations $A * X = B$, where *A* is an *n*-by-*n* Hermitian matrix stored in packed format, the columns of matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.

The diagonal pivoting method is used to factor A as $A = U * D * U^H$ or $A = L * D * L^H$, where U (or L) is a product of permutation and unit upper (lower) triangular matrices, and D is Hermitian and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

The factored form of A is then used to solve the system of equations $A * X = B$.

Input Parameters

<i>uplo</i>	<p>CHARACTER*1. Must be 'U' or 'L'.</p> <p>Indicates whether the upper or lower triangular part of A is stored:</p> <p>If <i>uplo</i> = 'U', the upper triangle of A is stored.</p> <p>If <i>uplo</i> = 'L', the lower triangle of A is stored.</p>
<i>n</i>	<p>INTEGER. The order of matrix A; $n \geq 0$.</p>
<i>nrhs</i>	<p>INTEGER. The number of right-hand sides; the number of columns in B; $nrhs \geq 0$.</p>
<i>ap</i> , <i>b</i>	<p>COMPLEX for <i>chpsv</i></p> <p>DOUBLE COMPLEX for <i>zhpsv</i>.</p> <p>Arrays: <i>ap</i>(size *), <i>b</i>(size <i>ldb</i> by *).</p> <p>The dimension of <i>ap</i> must be at least $\max(1, n(n+1)/2)$. The array <i>ap</i> contains the factor U or L, as specified by <i>uplo</i>, in <i>packed storage</i> (see Matrix Storage Schemes).</p> <p>The array <i>b</i> contains the matrix B whose columns are the right-hand sides for the systems of equations. The second dimension of <i>b</i> must be at least $\max(1, nrhs)$.</p>
<i>ldb</i>	<p>INTEGER. The leading dimension of <i>b</i>; $ldb \geq \max(1, n)$.</p>

Output Parameters

<i>ap</i>	<p>The block-diagonal matrix D and the multipliers used to obtain the factor U (or L) from the factorization of A as computed by ?hptrf, stored as a packed triangular matrix in the same storage format as A.</p>
<i>b</i>	<p>If <i>info</i> = 0, <i>b</i> is overwritten by the solution matrix X.</p>
<i>ipiv</i>	<p>INTEGER.</p> <p>Array, size at least $\max(1, n)$. Contains details of the interchanges and the block structure of D, as determined by ?hptrf.</p> <p>If <i>ipiv</i>(<i>i</i>) = <i>k</i> > 0, then d_{ii} is a 1-by-1 block, and the <i>i</i>-th row and column of A was interchanged with the <i>k</i>-th row and column.</p> <p>If <i>uplo</i> = 'U' and <i>ipiv</i>(<i>i</i>) = <i>ipiv</i>(<i>i</i>-1) = -<i>m</i> < 0, then D has a 2-by-2 block in rows/columns <i>i</i> and <i>i</i>-1, and (<i>i</i>-1)-th row and column of A was interchanged with the <i>m</i>-th row and column.</p> <p>If <i>uplo</i> = 'L' and <i>ipiv</i>(<i>i</i>) = <i>ipiv</i>(<i>i</i>+1) = -<i>m</i> < 0, then D has a 2-by-2 block in rows/columns <i>i</i> and <i>i</i>+1, and (<i>i</i>+1)-th row and column of A was interchanged with the <i>m</i>-th row and column.</p>

info INTEGER. If *info* = 0, the execution is successful.
 If *info* = -*i*, the *i*-th parameter had an illegal value.
 If *info* = *i*, d_{ii} is 0. The factorization has been completed, but *D* is exactly singular, so the solution could not be computed.

LAPACK 95 Interface Notes

Description

The routine uses the diagonal pivoting factorization to compute the solution to a complex system of linear equations $A*X = B$, where *A* is a *n*-by-*n* Hermitian matrix stored in packed format, the columns of matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.

Error bounds on the solution and a condition estimate are also provided.

The routine `?hpsvx` performs the following steps:

1. If *fact* = 'N', the diagonal pivoting method is used to factor the matrix *A*. The form of the factorization is $A = U*D*U^H$ or $A = L*D*L^H$, where *U* (or *L*) is a product of permutation and unit upper (lower) triangular matrices, and *D* is a Hermitian and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

2. If some $d_{i,i} = 0$, so that D is exactly singular, then the routine returns with $info = i$. Otherwise, the factored form of A is used to estimate the condition number of the matrix A . If the reciprocal of the condition number is less than machine precision, $info = n+1$ is returned as a warning, but the routine still goes on to solve for X and compute error bounds as described below.
3. The system of equations is solved for X using the factored form of A .
4. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.

Input Parameters

<i>fact</i>	<p>CHARACTER*1. Must be 'F' or 'N'.</p> <p>Specifies whether or not the factored form of the matrix A has been supplied on entry.</p> <p>If <i>fact</i> = 'F': on entry, <i>afp</i> and <i>ipiv</i> contain the factored form of A. Arrays <i>ap</i>, <i>afp</i>, and <i>ipiv</i> are not modified.</p> <p>If <i>fact</i> = 'N', the matrix A is copied to <i>afp</i> and factored.</p>
<i>uplo</i>	<p>CHARACTER*1. Must be 'U' or 'L'.</p> <p>Indicates whether the upper or lower triangular part of A is stored and how A is factored:</p> <p>If <i>uplo</i> = 'U', the array <i>ap</i> stores the upper triangular part of the Hermitian matrix A, and A is factored as $U^*D^*U^H$.</p> <p>If <i>uplo</i> = 'L', the array <i>ap</i> stores the lower triangular part of the Hermitian matrix A, and A is factored as $L^*D^*L^H$.</p>
<i>n</i>	<p>INTEGER. The order of matrix A; $n \geq 0$.</p>
<i>nrhs</i>	<p>INTEGER. The number of right-hand sides, the number of columns in B; $nrhs \geq 0$.</p>
<i>ap</i> , <i>afp</i> , <i>b</i> , <i>work</i>	<p>COMPLEX for <i>chpsvx</i> DOUBLE COMPLEX for <i>zhpsvx</i>.</p> <p>Arrays: <i>ap</i>(size *), <i>afp</i>(size *), <i>b</i>(size <i>ldb</i> by *), <i>work</i>(*).</p> <p>The array <i>ap</i> contains the upper or lower triangle of the Hermitian matrix A in <i>packed storage</i> (see Matrix Storage Schemes).</p> <p>The array <i>afp</i> is an input argument if <i>fact</i> = 'F'. It contains the block diagonal matrix D and the multipliers used to obtain the factor U or L from the factorization $A = U^*D^*U^H$ or $A = L^*D^*L^H$ as computed by <i>?hptrf</i>, in the same storage format as A.</p> <p>The array <i>b</i> contains the matrix B whose columns are the right-hand sides for the systems of equations.</p> <p><i>work</i>(*) is a workspace array.</p> <p>The dimension of arrays <i>ap</i> and <i>afp</i> must be at least $\max(1, n(n+1)/2)$; the second dimension of <i>b</i> must be at least $\max(1, nrhs)$; the dimension of <i>work</i> must be at least $\max(1, 2*n)$.</p>
<i>ldb</i>	<p>INTEGER. The leading dimension of <i>b</i>; $ldb \geq \max(1, n)$.</p>
<i>ipiv</i>	<p>INTEGER.</p>

Array, size at least $\max(1, n)$. The array *ipiv* is an input argument if *fact* = 'F'. It contains details of the interchanges and the block structure of *D*, as determined by [?hptrf](#).

If *ipiv*(*i*) = *k* > 0, then *d_{ii}* is a 1-by-1 block, and the *i*-th row and column of *A* was interchanged with the *k*-th row and column.

If *uplo* = 'U' and *ipiv*(*i*) = *ipiv*(*i*-1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*-1, and (*i*-1)-th row and column of *A* was interchanged with the *m*-th row and column.

If *uplo* = 'L' and *ipiv*(*i*) = *ipiv*(*i*+1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*+1, and (*i*+1)-th row and column of *A* was interchanged with the *m*-th row and column.

ldx INTEGER. The leading dimension of the output array *x*; $ldx \geq \max(1, n)$.

rwork REAL for *chpsvx*
DOUBLE PRECISION for *zhpsvx*.
Workspace array, size at least $\max(1, n)$.

Output Parameters

x COMPLEX for *chpsvx*
DOUBLE COMPLEX for *zhpsvx*.
Array, size *ldx* by *.
If *info* = 0 or *info* = *n*+1, the array *x* contains the solution matrix *X* to the system of equations. The second dimension of *x* must be at least $\max(1, nrhs)$.

afp, *ipiv* These arrays are output arguments if *fact* = 'N'. See the description of *afp*, *ipiv* in *Input Arguments* section.

rcond REAL for *chpsvx*
DOUBLE PRECISION for *zhpsvx*.
An estimate of the reciprocal condition number of the matrix *A*. If *rcond* is less than the machine precision (in particular, if *rcond* = 0), the matrix is singular to working precision. This condition is indicated by a return code of *info* > 0.

ferr REAL for *chpsvx*
DOUBLE PRECISION for *zhpsvx*.
Array, size at least $\max(1, nrhs)$. Contains the estimated forward error bound for each solution vector *x*(*j*) (the *j*-th column of the solution matrix *X*). If *xtrue* is the true solution corresponding to *x*(*j*), *ferr*(*j*) is an estimated upper bound for the magnitude of the largest element in (*x*(*j*) - *xtrue*) divided by the magnitude of the largest element in *x*(*j*). The estimate is as reliable as the estimate for *rcond*, and is almost always a slight overestimate of the true error.

<i>berr</i>	<p>REAL for <code>chpsvx</code></p> <p>DOUBLE PRECISION for <code>zhpsvx</code>.</p> <p>Array, size at least $\max(1, nrhs)$. Contains the component-wise relative backward error for each solution vector $x(j)$, that is, the smallest relative change in any element of A or B that makes $x(j)$ an exact solution.</p>
<i>info</i>	<p>INTEGER. If <i>info</i> = 0, the execution is successful.</p> <p>If <i>info</i> = -<i>i</i>, the <i>i</i>-th parameter had an illegal value.</p> <p>If <i>info</i> = <i>i</i>, and $i \leq n$, then d_{ii} is exactly zero. The factorization has been completed, but the block diagonal matrix D is exactly singular, so the solution and error bounds could not be computed; <i>rcond</i> = 0 is returned.</p> <p>If <i>info</i> = <i>i</i>, and $i = n + 1$, then D is nonsingular, but <i>rcond</i> is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of <i>rcond</i> would suggest.</p>

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `hpsvx` interface are as follows:

<i>ap</i>	Holds the array A of size $(n * (n+1) / 2)$.
<i>b</i>	Holds the matrix B of size $(n, nrhs)$.
<i>x</i>	Holds the matrix X of size $(n, nrhs)$.
<i>afp</i>	Holds the array AF of size $(n * (n+1) / 2)$.
<i>ipiv</i>	Holds the vector with the number of elements n .
<i>ferr</i>	Holds the vector with the number of elements $nrhs$.
<i>berr</i>	Holds the vector with the number of elements $nrhs$.
<i>uplo</i>	Must be 'U' or 'L'. The default value is 'U'.
<i>fact</i>	Must be 'N' or 'F'. The default value is 'N'. If <i>fact</i> = 'F', then both arguments <i>af</i> and <i>ipiv</i> must be present; otherwise, an error is returned.

Least Squares and Eigenvalue Problem Routines

This section includes descriptions of LAPACK [computational routines](#) and [driver routines](#) for solving linear least squares problems, eigenvalue and singular value problems, and performing a number of related computational tasks. For a full reference on LAPACK routines and related information see [\[LUG\]](#).

Least Squares Problems. A typical *least squares problem* is as follows: given a matrix A and a vector b , find the vector x that minimizes the sum of squares $\sum_i ((Ax)_i - b_i)^2$ or, equivalently, find the vector x that minimizes the 2-norm $\|Ax - b\|_2$.

In the most usual case, A is an m -by- n matrix with $m \geq n$ and $\text{rank}(A) = n$. This problem is also referred to as finding the *least squares solution* to an *overdetermined* system of linear equations (here we have more equations than unknowns). To solve this problem, you can use the *QR* factorization of the matrix A (see [QR Factorization](#)).

If $m < n$ and $\text{rank}(A) = m$, there exist an infinite number of solutions x which exactly satisfy $Ax = b$, and thus minimize the norm $\|Ax - b\|_2$. In this case it is often useful to find the unique solution that minimizes $\|x\|_2$. This problem is referred to as finding the *minimum-norm solution* to an *underdetermined* system of linear equations (here we have more unknowns than equations). To solve this problem, you can use the *LQ* factorization of the matrix A (see [LQ Factorization](#)).

In the general case you may have a *rank-deficient least squares problem*, with $\text{rank}(A) < \min(m, n)$: find the *minimum-norm least squares solution* that minimizes both $\|x\|_2$ and $\|Ax - b\|^2$. In this case (or when the rank of A is in doubt) you can use the *QR* factorization with pivoting or *singular value decomposition* (see [Singular Value Decomposition](#)).

Eigenvalue Problems. The eigenvalue problems (from German *eigen* "own") are stated as follows: given a matrix A , find the *eigenvalues* λ and the corresponding *eigenvectors* z that satisfy the equation

$$Az = \lambda z \text{ (right eigenvectors } z)$$

or the equation

$$z^H A = \lambda z^H \text{ (left eigenvectors } z).$$

If A is a real symmetric or complex Hermitian matrix, the above two equations are equivalent, and the problem is called a *symmetric* eigenvalue problem. Routines for solving this type of problems are described in the section [Symmetric Eigenvalue Problems](#).

Routines for solving eigenvalue problems with nonsymmetric or non-Hermitian matrices are described in the section [Nonsymmetric Eigenvalue Problems](#).

The library also includes routines that handle *generalized symmetric-definite eigenvalue problems*: find the eigenvalues λ and the corresponding eigenvectors x that satisfy one of the following equations:

$$Az = \lambda Bz, ABz = \lambda z, \text{ or } BAz = \lambda z,$$

where A is symmetric or Hermitian, and B is symmetric positive-definite or Hermitian positive-definite. Routines for reducing these problems to standard symmetric eigenvalue problems are described in the section [Generalized Symmetric-Definite Eigenvalue Problems](#).

To solve a particular problem, you usually call several computational routines. Sometimes you need to combine the routines of this chapter with other LAPACK routines described in "LAPACK Routines: Linear Equations" as well as with BLAS routines described in "BLAS and Sparse BLAS Routines".

For example, to solve a set of least squares problems minimizing $\|Ax - b\|^2$ for all columns b of a given matrix B (where A and B are real matrices), you can call `?geqrf` to form the factorization $A = QR$, then call `?ormqr` to compute $C = Q^H B$ and finally call the BLAS routine `?trsm` to solve for X the system of equations $RX = C$.

Another way is to call an appropriate driver routine that performs several tasks in one call. For example, to solve the least squares problem the driver routine `?gels` can be used.

Computational Routines

In the sections that follow, the descriptions of LAPACK computational routines are given. These routines perform distinct computational tasks that can be used for:

Orthogonal Factorizations

Singular Value Decomposition

Symmetric Eigenvalue Problems

Generalized Symmetric-Definite Eigenvalue Problems

Nonsymmetric Eigenvalue Problems

Generalized Nonsymmetric Eigenvalue Problems

Generalized Singular Value Decomposition

See also the respective [driver routines](#).

Orthogonal Factorizations

This section describes the LAPACK routines for the QR (RQ) and LQ (QL) factorization of matrices. Routines for the RZ factorization as well as for generalized QR and RQ factorizations are also included.

QR Factorization. Assume that A is an m -by- n matrix to be factored.

If $m \geq n$, the QR factorization is given by

$$A = \begin{pmatrix} Q_1 & Q_2 \end{pmatrix} \begin{pmatrix} R \\ 0 \end{pmatrix}$$

where R is an n -by- n upper triangular matrix with real diagonal elements, and Q is an m -by- m orthogonal (or unitary) matrix.

You can use the QR factorization for solving the following least squares problem: minimize $\|Ax - b\|^2$ where A is a full-rank m -by- n matrix ($m \geq n$). After factoring the matrix, compute the solution x by solving $Rx = (Q_1)^T b$.

If $m < n$, the QR factorization is given by

$$A = QR = Q(R_1 R_2)$$

where R is trapezoidal, R_1 is upper triangular and R_2 is rectangular.

Q is represented as a product of $\min(m, n)$ *elementary reflectors*. Routines are provided to work with Q in this representation.

LQ Factorization LQ factorization of an m -by- n matrix A is as follows. If $m \leq n$,

$$A = \begin{pmatrix} L & 0 \end{pmatrix} Q = \begin{pmatrix} L & 0 \end{pmatrix} \begin{pmatrix} Q_1 \\ Q_2 \end{pmatrix} = \begin{pmatrix} LQ_1 \end{pmatrix}$$

where L is an m -by- m lower triangular matrix with real diagonal elements, and Q is an n -by- n orthogonal (or unitary) matrix.

If $m > n$, the LQ factorization is

$$A = \begin{pmatrix} L_1 & L_2 \end{pmatrix} Q$$

where L_1 is an n -by- n lower triangular matrix, L_2 is rectangular, and Q is an n -by- n orthogonal (or unitary) matrix.

You can use the LQ factorization to find the minimum-norm solution of an underdetermined system of linear equations $Ax = b$ where A is an m -by- n matrix of rank m ($m < n$). After factoring the matrix, compute the solution vector x as follows: solve $Ly = b$ for y , and then compute $x = (Q_1)^H y$.

Table "Computational Routines for Orthogonal Factorization" lists LAPACK routines that perform orthogonal factorization of matrices.

Computational Routines for Orthogonal Factorization

Matrix type, factorization	Factorize without pivoting	Factorize with pivoting	Generate matrix Q	Apply matrix Q

?geqrf

Computes the QR factorization of a general m -by- n matrix.

Syntax

```
call sgeqrf(m, n, a, lda, tau, work, lwork, info)
call dgeqrf(m, n, a, lda, tau, work, lwork, info)
call cgeqrf(m, n, a, lda, tau, work, lwork, info)
call zgeqrf(m, n, a, lda, tau, work, lwork, info)
call geqrf(a [, tau] [, info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine forms the QR factorization of a general m -by- n matrix A (see [Orthogonal Factorizations](#)). No pivoting is performed.

The routine does not form the matrix Q explicitly. Instead, Q is represented as a product of $\min(m, n)$ *elementary reflectors*. Routines are provided to work with Q in this representation.

NOTE

This routine supports the Progress Routine feature. See [Progress Function](#) section for details.

Input Parameters

m	INTEGER. The number of rows in the matrix A ($m \geq 0$).
n	INTEGER. The number of columns in A ($n \geq 0$).
$a, work$	<p>REAL for <code>sgeqrf</code></p> <p>DOUBLE PRECISION for <code>dgeqrf</code></p> <p>COMPLEX for <code>cgeqrf</code></p> <p>DOUBLE COMPLEX for <code>zgeqrf</code>.</p> <p>Arrays: $a(lda,*)$ contains the matrix A. The second dimension of a must be at least $\max(1, n)$.</p> <p>$work$ is a workspace array, its dimension $\max(1, lwork)$.</p>
lda	INTEGER. The leading dimension of a ; at least $\max(1, m)$.
$lwork$	<p>INTEGER. The size of the $work$ array ($lwork \geq n$).</p> <p>If $lwork = -1$, then a workspace query is assumed; the routine only calculates the optimal size of the $work$ array, returns this value as the first entry of the $work$ array, and no error message related to $lwork$ is issued by xerbla.</p> <p>See Application Notes for the suggested value of $lwork$.</p>

Output Parameters

a	<p>Overwritten by the factorization data as follows:</p> <p>The elements on and above the diagonal of the array contain the $\min(m, n)$-by-n upper trapezoidal matrix R (R is upper triangular if $m \geq n$); the elements below the diagonal, with the array tau, present the orthogonal matrix Q as a product of $\min(m, n)$ elementary reflectors (see Orthogonal Factorizations).</p>
tau	<p>REAL for <code>sgeqrf</code></p> <p>DOUBLE PRECISION for <code>dgeqrf</code></p> <p>COMPLEX for <code>cgeqrf</code></p> <p>DOUBLE COMPLEX for <code>zgeqrf</code>.</p> <p>Array, size at least $\max(1, \min(m, n))$. Contains scalars that define elementary reflectors for the matrix Q in its decomposition in a product of elementary reflectors (see Orthogonal Factorizations).</p>
$work(1)$	If $info = 0$, on exit $work(1)$ contains the minimum value of $lwork$ required for optimum performance. Use this $lwork$ for subsequent runs.

info INTEGER.
 If *info* = 0, the execution is successful.
 If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine *geqrf* interface are the following:

a Holds the matrix *A* of size (*m*,*n*).
tau Holds the vector of length min(*m*,*n*)

Application Notes

For better performance, try using *lwork* = *n***blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed factorization is the exact factorization of a matrix *A* + *E*, where

$$\|E\|_2 = O(\epsilon) \|A\|_2.$$

The approximate number of floating-point operations for real flavors is

$$\begin{aligned} (4/3)n^3 & \quad \text{if } m = n, \\ (2/3)n^2(3m-n) & \quad \text{if } m > n, \\ (2/3)m^2(3n-m) & \quad \text{if } m < n. \end{aligned}$$

The number of operations for complex flavors is 4 times greater.

To solve a set of least squares problems minimizing $\|A^*x - b\|_2$ for all columns *b* of a given matrix *B*, you can call the following:

?*geqrf* (this routine) to factorize $A = QR$;
ormqr to compute $C = Q^T B$ (for real matrices);
unmqr to compute $C = Q^H B$ (for complex matrices);
trsm (a BLAS routine) to solve $R^*X = C$.

(The columns of the computed X are the least squares solution vectors x .)

To compute the elements of Q explicitly, call

`orgqr` (for real matrices)

`ungqr` (for complex matrices).

Description

The routine forms the QR factorization of a general m -by- n matrix A (see [Orthogonal Factorizations](#)). No pivoting is performed. The diagonal entries of R are real and nonnegative.

The routine does not form the matrix Q explicitly. Instead, Q is represented as a product of $\min(m, n)$ *elementary reflectors*. Routines are provided to work with Q in this representation.

NOTE

This routine supports the Progress Routine feature. See [Progress Function](#) section for details.

Input Parameters

m INTEGER. The number of rows in the matrix A ($m \geq 0$).

n INTEGER. The number of columns in A ($n \geq 0$).

$a, work$ REAL for `sgeqrfp`

DOUBLE PRECISION for `dgeqrfp`

COMPLEX for `cgeqrfp`

DOUBLE COMPLEX for `zgeqrfp`.

Arrays: $a(lda,*)$ contains the matrix A . The second dimension of a must be at least $\max(1, n)$.

$work$ is a workspace array, its dimension $\max(1, lwork)$.

<i>lda</i>	INTEGER. The leading dimension of <i>a</i> ; at least $\max(1, m)$.
<i>lwork</i>	<p>INTEGER. The size of the <i>work</i> array ($lwork \geq n$).</p> <p>If $lwork = -1$, then a workspace query is assumed; the routine only calculates the optimal size of the <i>work</i> array, returns this value as the first entry of the <i>work</i> array, and no error message related to <i>lwork</i> is issued by xerbla.</p> <p>See Application Notes for the suggested value of <i>lwork</i>.</p>

Output Parameters

<i>a</i>	<p>Overwritten by the factorization data as follows:</p> <p>The elements on and above the diagonal of the array contain the $\min(m, n)$-by-<i>n</i> upper trapezoidal matrix <i>R</i> (<i>R</i> is upper triangular if $m \geq n$); the elements below the diagonal, with the array <i>tau</i>, present the orthogonal matrix <i>Q</i> as a product of $\min(m, n)$ elementary reflectors (see Orthogonal Factorizations).</p> <p>The diagonal elements of the matrix <i>R</i> are real and non-negative.</p>
<i>tau</i>	<p>REAL for <i>sgeqrfp</i></p> <p>DOUBLE PRECISION for <i>dgeqrfp</i></p> <p>COMPLEX for <i>cgeqrfp</i></p> <p>DOUBLE COMPLEX for <i>zgeqrfp</i>.</p> <p>Array, size at least $\max(1, \min(m, n))$. Contains scalars that define elementary reflectors for the matrix <i>Q</i> in its decomposition in a product of elementary reflectors (see Orthogonal Factorizations).</p>
<i>work</i> (1)	If <i>info</i> = 0, on exit <i>work</i> (1) contains the minimum value of <i>lwork</i> required for optimum performance. Use this <i>lwork</i> for subsequent runs.
<i>info</i>	<p>INTEGER.</p> <p>If <i>info</i> = 0, the execution is successful.</p> <p>If <i>info</i> = -<i>i</i>, the <i>i</i>-th parameter had an illegal value.</p>

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine *geqrfp* interface are the following:

<i>a</i>	Holds the matrix <i>A</i> of size (<i>m</i> , <i>n</i>).
<i>tau</i>	Holds the vector of length $\min(m, n)$

Application Notes

For better performance, try using $lwork = n * blocksize$, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set $lwork = -1$.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed factorization is the exact factorization of a matrix $A + E$, where

$$\|E\|_2 = O(\epsilon) \|A\|_2.$$

The approximate number of floating-point operations for real flavors is

$$\begin{aligned} (4/3)n^3 & \quad \text{if } m = n, \\ (2/3)n^2(3m-n) & \quad \text{if } m > n, \\ (2/3)m^2(3n-m) & \quad \text{if } m < n. \end{aligned}$$

The number of operations for complex flavors is 4 times greater.

To solve a set of least squares problems minimizing $\|A^*x - b\|_2$ for all columns *b* of a given matrix *B*, you can call the following:

<code>?geqrfp</code> (this routine)	to factorize $A = QR$;
<code>ormqr</code>	to compute $C = Q^T * B$ (for real matrices);
<code>unmqr</code>	to compute $C = Q^H * B$ (for complex matrices);
<code>trsm</code> (a BLAS routine)	to solve $R * X = C$.

(The columns of the computed *X* are the least squares solution vectors *x*.)

To compute the elements of *Q* explicitly, call

<code>orgqr</code>	(for real matrices)
<code>ungqr</code>	(for complex matrices).

call geqrt(a, t, nb[, info])
```

Include Files

- `mkl.fi`, `lapack.f90`

Description

The strictly lower triangular matrix V contains the elementary reflectors $H(i)$ in the i th column below the diagonal. For example, if $m=5$ and $n=3$, the matrix V is

$$V = \begin{bmatrix} 1 & & & & \\ v_1 & 1 & & & \\ v_1 & v_2 & 1 & & \\ v_1 & v_2 & v_3 & & \\ v_1 & v_2 & v_3 & & \end{bmatrix}$$

where v_i represents one of the vectors that define $H(i)$. The vectors are returned in the lower triangular part of array a .

NOTE

The 1s along the diagonal of V are not stored in a .

Let $k = \min(m, n)$. The number of blocks is $b = \text{ceiling}(k/nb)$, where each block is of order nb except for the last block, which is of order $ib = k - (b-1)*nb$. For each of the b blocks, a upper triangular block reflector factor is computed: $t1, t2, \dots, tb$. The nb -by- nb (and ib -by- ib for the last block) t s are stored in the nb -by- n array t as

$$t = (t1t2 \dots tb).$$

Input Parameters

m	INTEGER. The number of rows in the matrix A ($m \geq 0$).
n	INTEGER. The number of columns in A ($n \geq 0$).
nb	INTEGER. The block size to be used in the blocked QR ($\min(m, n) \geq nb \geq 1$).
$a, work$	REAL for <code>sgeqrt</code> DOUBLE PRECISION for <code>dgeqrt</code> COMPLEX for <code>cgeqrt</code> COMPLEX*16 for <code>zgeqrt</code> . Arrays: a DIMENSION (lda, n) contains the m -by- n matrix A . $work$ DIMENSION (nb, n) is a workspace array.
lda	INTEGER. The leading dimension of a ; at least $\max(1, m)$.
ldt	INTEGER. The leading dimension of t ; at least nb .

Output Parameters

<i>a</i>	Overwritten by the factorization data as follows: The elements on and above the diagonal of the array contain the $\min(m,n)$ -by- n upper trapezoidal matrix R (R is upper triangular if $m \geq n$); the elements below the diagonal, with the array <i>t</i> , present the orthogonal matrix Q as a product of $\min(m,n)$ elementary reflectors (see Orthogonal Factorizations).
<i>t</i>	REAL for sgeqrt DOUBLE PRECISION for dgeqrt COMPLEX for cgeqrt COMPLEX*16 for zgeqrt. Array, DIMENSION (<i>ldt</i> , $\min(m, n)$). The upper triangular block reflector's factors stored as a sequence of upper triangular blocks.
<i>info</i>	INTEGER. If <i>info</i> = 0, the execution is successful. If <i>info</i> < 0 and <i>info</i> = - <i>i</i> , the <i>i</i> th argument had an illegal value.

?gemqrt

Multiplies a general matrix by the orthogonal/unitary matrix Q of the QR factorization formed by ?geqrt.

Syntax

```
call sgemqrt(side, trans, m, n, k, nb, v, ldv, t, ldt, c, ldc, work, info)
call dgemqrt(side, trans, m, n, k, nb, v, ldv, t, ldt, c, ldc, work, info)
call cgemqrt(side, trans, m, n, k, nb, v, ldv, t, ldt, c, ldc, work, info)
call zgemqrt(side, trans, m, n, k, nb, v, ldv, t, ldt, c, ldc, work, info)
call gemqrt( v, t, c, k, nb[, trans][, side][, info])
```

Include Files

- mkl.fi, lapack.f90

Description

The ?gemqrt routine overwrites the general real or complex m -by- n matrix C with

	<i>side</i> = 'L'	<i>side</i> = 'R'
<i>trans</i> = 'N':	Q^*C	C^*Q
<i>trans</i> = 'T':	$Q^T C$	$C^* Q^T$
<i>trans</i> = 'C':	$Q^H C$	$C^* Q^H$

where Q is a real orthogonal (complex unitary) matrix defined as the product of k elementary reflectors

$Q = H(1) H(2) \dots H(k) = I - V^* T^* V^T$ for real flavors, and

$Q = H(1) H(2) \dots H(k) = I - V^* T^* V^H$ for complex flavors,

generated using the compact WY representation as returned by [geqrt](#). Q is of order m if *side* = 'L' and of order n if *side* = 'R'.

Input Parameters

<i>side</i>	<p>CHARACTER</p> <p>= 'L': apply Q, Q^T, or Q^H from the left.</p> <p>= 'R': apply Q, Q^T, or Q^H from the right.</p>
<i>trans</i>	<p>CHARACTER</p> <p>= 'N', no transpose, apply Q.</p> <p>= 'T', transpose, apply Q^T.</p> <p>= 'C', transpose, apply Q^H.</p>
<i>m</i>	INTEGER. The number of rows in the matrix C , ($m \geq 0$).
<i>n</i>	INTEGER. The number of columns in the matrix C , ($n \geq 0$).
<i>k</i>	<p>INTEGER. The number of elementary reflectors whose product defines the matrix Q. Constraints:</p> <p>If <i>side</i> = 'L', $m \geq k \geq 0$</p> <p>If <i>side</i> = 'R', $n \geq k \geq 0$.</p>
<i>nb</i>	<p>INTEGER.</p> <p>The block size used for the storage of t, $k \geq nb \geq 1$. This must be the same value of <i>nb</i> used to generate t in geqrt.</p>
<i>v</i>	<p>REAL for <i>sgemqrt</i></p> <p>DOUBLE PRECISION for <i>dgemqrt</i></p> <p>COMPLEX for <i>cgemqrt</i></p> <p>COMPLEX*16 for <i>zgemqrt</i>.</p> <p>Array, DIMENSION (ldv, k).</p> <p>The ith column must contain the vector which defines the elementary reflector $H(i)$, for $i = 1, 2, \dots, k$, as returned by geqrt in the first k columns of its array argument a.</p>
<i>ldv</i>	<p>INTEGER. The leading dimension of the array v.</p> <p>if <i>side</i> = 'L', ldv must be at least $\max(1, m)$;</p> <p>if <i>side</i> = 'R', ldv must be at least $\max(1, n)$.</p>
<i>t</i>	<p>REAL for <i>sgemqrt</i></p> <p>DOUBLE PRECISION for <i>dgemqrt</i></p> <p>COMPLEX for <i>cgemqrt</i></p> <p>COMPLEX*16 for <i>zgemqrt</i>.</p> <p>Array, DIMENSION (ldt, k).</p> <p>The upper triangular factors of the block reflectors as returned by geqrt.</p>
<i>ldt</i>	INTEGER. The leading dimension of the array t . ldt must be at least <i>nb</i> .

<i>c</i>	<p>REAL for sgemqrt</p> <p>DOUBLE PRECISION for dgemqrt</p> <p>COMPLEX for cgemqrt</p> <p>COMPLEX*16 for zgemqrt.</p> <p>The m-by-n matrix C.</p>
<i>ldc</i>	<p>INTEGER. The leading dimension of the array c. <i>ldc</i> must be at least $\max(1, m)$.</p>
<i>work</i>	<p>REAL for sgemqrt</p> <p>DOUBLE PRECISION for dgemqrt</p> <p>COMPLEX for cgemqrt</p> <p>COMPLEX*16 for zgemqrt.</p> <p>Workspace array.</p> <p>If <i>side</i> = 'L' DIMENSION $n*nb$.</p> <p>If <i>side</i> = 'R' DIMENSION $m*nb$.</p>

Output Parameters

<i>c</i>	Overwritten by the product Q^*C , C^*Q , $Q^T C$, $C^* Q^T$, $Q^H C$, or $C^* Q^H$ as specified by <i>side</i> and <i>trans</i> .
<i>info</i>	<p>INTEGER.</p> <p>= 0: the execution is successful.</p> <p>< 0: if <i>info</i> = $-i$, the ith argument had an illegal value.</p>

?geqpf

Computes the QR factorization of a general m -by- n matrix with pivoting.

Syntax

```
call sgeqpf(m, n, a, lda, jpvt, tau, work, info)
call dgeqpf(m, n, a, lda, jpvt, tau, work, info)
call cgeqpf(m, n, a, lda, jpvt, tau, work, rwork, info)
call zgeqpf(m, n, a, lda, jpvt, tau, work, rwork, info)
call geqpf(a, jpvt [,tau] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine is deprecated and has been replaced by routine [geqp3](#).

The routine ?geqpf forms the QR factorization of a general m -by- n matrix A with column pivoting: $A^*P = Q^*R$ (see [Orthogonal Factorizations](#)). Here P denotes an n -by- n permutation matrix.

The routine does not form the matrix Q explicitly. Instead, Q is represented as a product of $\min(m, n)$ *elementary reflectors*. Routines are provided to work with Q in this representation.

Input Parameters

m	INTEGER. The number of rows in the matrix A ($m \geq 0$).
n	INTEGER. The number of columns in A ($n \geq 0$).
$a, work$	REAL for <code>sgeqpf</code> DOUBLE PRECISION for <code>dgeqpf</code> COMPLEX for <code>cgeqpf</code> DOUBLE COMPLEX for <code>zgeqpf</code> . Arrays: a ($lda, *$) contains the matrix A . The second dimension of a must be at least $\max(1, n)$. $work$ ($lwork$) is a workspace array. The size of the $work$ array must be at least $\max(1, 3*n)$ for real flavors and at least $\max(1, n)$ for complex flavors.
lda	INTEGER. The leading dimension of a ; at least $\max(1, m)$.
$jpvt$	INTEGER. Array, size at least $\max(1, n)$. On entry, if $jpvt(i) > 0$, the i -th column of A is moved to the beginning of $A*P$ before the computation, and fixed in place during the computation. If $jpvt(i) = 0$, the i th column of A is a free column (that is, it may be interchanged during the computation with any other free column).
$rwork$	REAL for <code>cgeqpf</code> DOUBLE PRECISION for <code>zgeqpf</code> . A workspace array, DIMENSION at least $\max(1, 2*n)$.

Output Parameters

a	Overwritten by the factorization data as follows: The elements on and above the diagonal of the array contain the $\min(m, n)$ -by- n upper trapezoidal matrix R (R is upper triangular if $m \geq n$); the elements below the diagonal, with the array tau , present the orthogonal matrix Q as a product of $\min(m, n)$ elementary reflectors (see Orthogonal Factorizations).
tau	REAL for <code>sgeqpf</code> DOUBLE PRECISION for <code>dgeqpf</code> COMPLEX for <code>cgeqpf</code> DOUBLE COMPLEX for <code>zgeqpf</code> . Array, size at least $\max(1, \min(m, n))$. Contains additional information on the matrix Q .
$jpvt$	Overwritten by details of the permutation matrix P in the factorization $A*P = Q*R$. More precisely, the columns of $A*P$ are the columns of A in the following order:

$jpvt(1), jpvt(2), \dots, jpvt(n).$

info

INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `geqpf` interface are the following:

<i>a</i>	Holds the matrix <i>A</i> of size (m,n) .
<i>jpvt</i>	Holds the vector of length <i>n</i> .
<i>tau</i>	Holds the vector of length $\min(m,n)$

Application Notes

The computed factorization is the exact factorization of a matrix $A + E$, where

$$\|E\|_2 = O(\epsilon) \|A\|_2.$$

The approximate number of floating-point operations for real flavors is

$(4/3)n^3$	if $m = n$,
$(2/3)n^2(3m-n)$	if $m > n$,
$(2/3)m^2(3n-m)$	if $m < n$.

The number of operations for complex flavors is 4 times greater.

To solve a set of least squares problems minimizing $\|A^*x - b\|_2$ for all columns *b* of a given matrix *B*, you can call the following:

<code>?geqpf</code> (this routine)	to factorize $A^*P = Q^*R$;
<code>ormqr</code>	to compute $C = Q^T * B$ (for real matrices);
<code>unmqr</code>	to compute $C = Q^H * B$ (for complex matrices);
<code>trsm</code> (a BLAS routine)	to solve $R^*X = C$.

(The columns of the computed *X* are the permuted least squares solution vectors *x*; the output array *jpvt* specifies the permutation order.)

To compute the elements of *Q* explicitly, call

<code>orgqr</code>	(for real matrices)
<code>ungqr</code>	(for complex matrices).

?geqp3

Computes the *QR* factorization of a general *m*-by-*n* matrix with column pivoting using level 3 BLAS.

Syntax

```
call sgeqp3(m, n, a, lda, jpvt, tau, work, lwork, info)
call dgeqp3(m, n, a, lda, jpvt, tau, work, lwork, info)
call cgeqp3(m, n, a, lda, jpvt, tau, work, lwork, rwork, info)
call zgeqp3(m, n, a, lda, jpvt, tau, work, lwork, rwork, info)
call geqp3(a, jpvt [,tau] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine forms the *QR* factorization of a general *m*-by-*n* matrix *A* with column pivoting: $A^*P = Q^*R$ (see [Orthogonal Factorizations](#)) using Level 3 BLAS. Here *P* denotes an *n*-by-*n* permutation matrix. Use this routine instead of [geqpf](#) for better performance.

The routine does not form the matrix *Q* explicitly. Instead, *Q* is represented as a product of $\min(m, n)$ *elementary reflectors*. Routines are provided to work with *Q* in this representation.

Input Parameters

<i>m</i>	INTEGER. The number of rows in the matrix <i>A</i> ($m \geq 0$).
<i>n</i>	INTEGER. The number of columns in <i>A</i> ($n \geq 0$).
<i>a</i> , <i>work</i>	<p>REAL for sgeqp3</p> <p>DOUBLE PRECISION for dgeqp3</p> <p>COMPLEX for cgeqp3</p> <p>DOUBLE COMPLEX for zgeqp3.</p> <p>Arrays:</p> <p><i>a</i> (<i>lda</i>,*) contains the matrix <i>A</i>.</p> <p>The second dimension of <i>a</i> must be at least $\max(1, n)$.</p> <p><i>work</i> is a workspace array, its dimension $\max(1, lwork)$.</p>
<i>lda</i>	INTEGER. The leading dimension of <i>a</i> ; at least $\max(1, m)$.
<i>lwork</i>	<p>INTEGER. The size of the <i>work</i> array; must be at least $\max(1, 3*n+1)$ for real flavors, and at least $\max(1, n+1)$ for complex flavors.</p> <p>If <i>lwork</i> = -1, then a workspace query is assumed; the routine only calculates the optimal size of the <i>work</i> array, returns this value as the first entry of the <i>work</i> array, and no error message related to <i>lwork</i> is issued by xerbla. See <i>Application Notes</i> below for details.</p>
<i>jpvt</i>	<p>INTEGER.</p> <p>Array, size at least $\max(1, n)$.</p>

On entry, if $jpvt(i) \neq 0$, the i -th column of A is moved to the beginning of AP before the computation, and fixed in place during the computation.

If $jpvt(i) = 0$, the i -th column of A is a free column (that is, it may be interchanged during the computation with any other free column).

rwork

REAL for cgeqp3

DOUBLE PRECISION for zgeqp3.

A workspace array, size at least $\max(1, 2*n)$. Used in complex flavors only.

Output Parameters

a

Overwritten by the factorization data as follows:

The elements on and above the diagonal of the array contain the $\min(m,n)$ -by- n upper trapezoidal matrix R (R is upper triangular if $m \geq n$); the elements below the diagonal, with the array *tau*, present the orthogonal matrix Q as a product of $\min(m,n)$ elementary reflectors (see [Orthogonal Factorizations](#)).

tau

REAL for sgeqp3

DOUBLE PRECISION for dgeqp3

COMPLEX for cgeqp3

DOUBLE COMPLEX for zgeqp3.

Array, size at least $\max(1, \min(m, n))$. Contains scalar factors of the elementary reflectors for the matrix Q .

jpvt

Overwritten by details of the permutation matrix P in the factorization $A*P = Q*R$. More precisely, the columns of AP are the columns of A in the following order:

$jpvt(1), jpvt(2), \dots, jpvt(n)$.

info

INTEGER.

If $info = 0$, the execution is successful.

If $info = -i$, the i -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `geqp3` interface are the following:

a

Holds the matrix A of size (m,n) .

jpvt

Holds the vector of length n .

tau

Holds the vector of length $\min(m,n)$

Application Notes

To solve a set of least squares problems minimizing $\|A*x - b\|_2$ for all columns b of a given matrix B , you can call the following:

<code>?geqp3</code> (this routine)	to factorize $A^*P = Q^*R$;
<code>ormqr</code>	to compute $C = Q^T * B$ (for real matrices);
<code>unmqr</code>	to compute $C = Q^H * B$ (for complex matrices);
<code>trsm</code> (a BLAS routine)	to solve $R^*X = C$.

(The columns of the computed X are the permuted least squares solution vectors x ; the output array *jpvt* specifies the permutation order.)

To compute the elements of Q explicitly, call

<code>orgqr</code>	(for real matrices)
<code>ungqr</code>	(for complex matrices).

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?orgqr

Generates the real orthogonal matrix Q of the QR factorization formed by ?geqrf.

Syntax

```
call sorgqr(m, n, k, a, lda, tau, work, lwork, info)
call dorgqr(m, n, k, a, lda, tau, work, lwork, info)
call orgqr(a, tau [,info])
```

Include Files

- `mk1.fi`, `lapack.f90`

Description

The routine generates the whole or part of m -by- m orthogonal matrix Q of the QR factorization formed by the routines `geqrf` or `geqpf`. Use this routine after a call to `sgeqrf/dgeqrf` or `sgeqpf/dgeqpf`.

Usually Q is determined from the QR factorization of an m by p matrix A with $m \geq p$. To compute the whole matrix Q , use:

```
call?orgqr(m, m, p, a, lda, tau, work, lwork, info)
```

To compute the leading p columns of Q (which form an orthonormal basis in the space spanned by the columns of A):

```
call?orgqr(m, p, p, a, lda, work, lwork, info)
```

To compute the matrix Q^k of the QR factorization of leading k columns of the matrix A :

```
call?orgqr(m, m, k, a, lda, tau, work, lwork, info)
```

To compute the leading k columns of Q^k (which form an orthonormal basis in the space spanned by leading k columns of the matrix A):

```
call?orgqr(m, k, k, a, lda, tau, work, lwork, info)
```

Input Parameters

m	INTEGER. The order of the orthogonal matrix Q ($m \geq 0$).
n	INTEGER. The number of columns of Q to be computed ($0 \leq n \leq m$).
k	INTEGER. The number of elementary reflectors whose product defines the matrix Q ($0 \leq k \leq n$).
$a, \tau, work$	REAL for sorgqr DOUBLE PRECISION for dorgqr Arrays: $a(lda,*)$ and $\tau(*)$ are the arrays returned by sgeqrf / dgeqrf or sgeqpf / dgeqpf. The second dimension of a must be at least $\max(1, n)$. The size of τ must be at least $\max(1, k)$. $work$ is a workspace array, its dimension $\max(1, lwork)$.
lda	INTEGER. The leading dimension of a ; at least $\max(1, m)$.
$lwork$	INTEGER. The size of the $work$ array ($lwork \geq n$). If $lwork = -1$, then a workspace query is assumed; the routine only calculates the optimal size of the $work$ array, returns this value as the first entry of the $work$ array, and no error message related to $lwork$ is issued by xerbla . See <i>Application Notes</i> for the suggested value of $lwork$.

Output Parameters

a	Overwritten by n leading columns of the m -by- m orthogonal matrix Q .
$work(1)$	If $info = 0$, on exit $work(1)$ contains the minimum value of $lwork$ required for optimum performance. Use this $lwork$ for subsequent runs.
$info$	INTEGER. If $info = 0$, the execution is successful. If $info = -i$, the i -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `orgqr` interface are the following:

<code>a</code>	Holds the matrix A of size (m,n) .
<code>tau</code>	Holds the vector of length (k)

Application Notes

For better performance, try using `lwork = n*blocksize`, where `blocksize` is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of `lwork` for the first run or set `lwork = -1`.

If you choose the first option and set any of admissible `lwork` sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array `work` on exit. Use this value (`work(1)`) for subsequent runs.

If you set `lwork = -1`, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (`work`). This operation is called a workspace query.

Note that if you set `lwork` to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed Q differs from an exactly orthogonal matrix by a matrix E such that

$$\|E\|_2 = O(\varepsilon) \|A\|_2 \text{ where } \varepsilon \text{ is the machine precision.}$$

The total number of floating-point operations is approximately $4*m*n*k - 2*(m+n)*k^2 + (4/3)*k^3$.

If $n = k$, the number is approximately $(2/3)*n^2*(3m - n)$.

The complex counterpart of this routine is `ungqr`.

?ormqr

Multiplies a real matrix by the orthogonal matrix Q of the QR factorization formed by ?geqrf or ?geqpf.

Syntax

```
call sormqr(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call dormqr(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call ormqr(a, tau, c [,side] [,trans] [,info])
```

Include Files

- `mk1.fi`, `lapack.f90`

Description

The routine multiplies a real matrix C by Q or Q^T , where Q is the orthogonal matrix Q of the QR factorization formed by the routines `geqrf` or `geqpf`.

Depending on the parameters `side` and `trans`, the routine can form one of the matrix products Q^*C , Q^T*C , $C*Q$, or $C*Q^T$ (overwriting the result on C).

Input Parameters

<i>side</i>	<p>CHARACTER*1. Must be either 'L' or 'R'.</p> <p>If <i>side</i>='L', Q or Q^T is applied to C from the left.</p> <p>If <i>side</i>='R', Q or Q^T is applied to C from the right.</p>
<i>trans</i>	<p>CHARACTER*1. Must be either 'N' or 'T'.</p> <p>If <i>trans</i>='N', the routine multiplies C by Q.</p> <p>If <i>trans</i>='T', the routine multiplies C by Q^T.</p>
<i>m</i>	INTEGER. The number of rows in the matrix C ($m \geq 0$).
<i>n</i>	INTEGER. The number of columns in C ($n \geq 0$).
<i>k</i>	<p>INTEGER. The number of elementary reflectors whose product defines the matrix Q. Constraints:</p> <p>$0 \leq k \leq m$ if <i>side</i>='L';</p> <p>$0 \leq k \leq n$ if <i>side</i>='R'.</p>
<i>a</i> , <i>tau</i> , <i>c</i> , <i>work</i>	<p>REAL for <code>sgeqrf</code></p> <p>DOUBLE PRECISION for <code>dgeqrf</code>.</p> <p>Arrays:</p> <p><i>a</i>(<i>lda</i>,*) and <i>tau</i>(*) are the arrays returned by <code>sgeqrf</code> / <code>dgeqrf</code> or <code>sgeqpf</code> / <code>dgeqpf</code>.</p> <p>The second dimension of <i>a</i> must be at least $\max(1, k)$.</p> <p>The size of <i>tau</i> must be at least $\max(1, k)$.</p> <p><i>c</i>(<i>ldc</i>,*) contains the matrix C.</p> <p>The second dimension of <i>c</i> must be at least $\max(1, n)$</p> <p><i>work</i> is a workspace array, its dimension $\max(1, lwork)$.</p>
<i>lda</i>	<p>INTEGER. The leading dimension of <i>a</i>. Constraints:</p> <p>if <i>side</i> = 'L', $lda \geq \max(1, m)$;</p> <p>if <i>side</i> = 'R', $lda \geq \max(1, n)$.</p>
<i>ldc</i>	<p>INTEGER. The leading dimension of <i>c</i>. Constraint:</p> <p>$ldc \geq \max(1, m)$.</p>
<i>lwork</i>	<p>INTEGER. The size of the <i>work</i> array. Constraints:</p> <p>$lwork \geq \max(1, n)$ if <i>side</i> = 'L';</p> <p>$lwork \geq \max(1, m)$ if <i>side</i> = 'R'.</p> <p>If <i>lwork</i> = -1, then a workspace query is assumed; the routine only calculates the optimal size of the <i>work</i> array, returns this value as the first entry of the <i>work</i> array, and no error message related to <i>lwork</i> is issued by xerbla.</p> <p>See <i>Application Notes</i> for the suggested value of <i>lwork</i>.</p>

Output Parameters

<i>c</i>	Overwritten by the product Q^*C , $Q^T C$, C^*Q , or $C^T Q^T$ (as specified by <i>side</i> and <i>trans</i>).
<i>work</i> (1)	If <i>info</i> = 0, on exit <i>work</i> (1) contains the minimum value of <i>lwork</i> required for optimum performance. Use this <i>lwork</i> for subsequent runs.
<i>info</i>	INTEGER. If <i>info</i> = 0, the execution is successful. If <i>info</i> = - <i>i</i> , the <i>i</i> -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `ormqr` interface are the following:

<i>a</i>	Holds the matrix <i>A</i> of size (<i>r</i> , <i>k</i>). $r = m$ if <i>side</i> = 'L'. $r = n$ if <i>side</i> = 'R'.
<i>tau</i>	Holds the vector of length (<i>k</i>).
<i>c</i>	Holds the matrix <i>C</i> of size (<i>m</i> , <i>n</i>).
<i>side</i>	Must be 'L' or 'R'. The default value is 'L'.
<i>trans</i>	Must be 'N' or 'T'. The default value is 'N'.

Application Notes

For better performance, try using *lwork* = *n***blocksize* (if *side* = 'L') or *lwork* = *m***blocksize* (if *side* = 'R') where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The complex counterpart of this routine is `unmqr`.

?ungqr

Generates the complex unitary matrix Q of the QR factorization formed by ?geqrf.

Syntax

```
call cunqqr(m, n, k, a, lda, tau, work, lwork, info)
call zungqr(m, n, k, a, lda, tau, work, lwork, info)
call ungqr(a, tau [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine generates the whole or part of m -by- m unitary matrix Q of the QR factorization formed by the routines [geqrf](#) or [geqpf](#). Use this routine after a call to [cgeqrf/zgeqrf](#) or [cgeqpf/zgeqpf](#).

Usually Q is determined from the QR factorization of an m by p matrix A with $m \geq p$. To compute the whole matrix Q , use:

```
call?ungqr(m, m, p, a, lda, tau, work, lwork, info)
```

To compute the leading p columns of Q (which form an orthonormal basis in the space spanned by the columns of A):

```
call?ungqr(m, p, p, a, lda, tau, work, lwork, info)
```

To compute the matrix Q^k of the QR factorization of the leading k columns of the matrix A :

```
call?ungqr(m, m, k, a, lda, tau, work, lwork, info)
```

To compute the leading k columns of Q^k (which form an orthonormal basis in the space spanned by the leading k columns of the matrix A):

```
call?ungqr(m, k, k, a, lda, tau, work, lwork, info)
```

Input Parameters

m	INTEGER. The order of the unitary matrix Q ($m \geq 0$).
n	INTEGER. The number of columns of Q to be computed ($0 \leq n \leq m$).
k	INTEGER. The number of elementary reflectors whose product defines the matrix Q ($0 \leq k \leq n$).
$a, \tau, work$	COMPLEX for cunqqr DOUBLE COMPLEX for zungqr Arrays: $a(lda,*)$ and $\tau(*)$ are the arrays returned by cgeqrf/zgeqrf or cgeqpf/zgeqpf . The second dimension of a must be at least $\max(1, n)$. The size of τ must be at least $\max(1, k)$. $work$ is a workspace array, its dimension $\max(1, lwork)$.
lda	INTEGER. The leading dimension of a ; at least $\max(1, m)$.
$lwork$	INTEGER. The size of the $work$ array ($lwork \geq n$).

If $lwork = -1$, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by [xerbla](#).

See *Application Notes* for the suggested value of *lwork*.

Output Parameters

<i>a</i>	Overwritten by n leading columns of the m -by- m unitary matrix Q .
<i>work</i> (1)	If <i>info</i> = 0, on exit <i>work</i> (1) contains the minimum value of <i>lwork</i> required for optimum performance. Use this <i>lwork</i> for subsequent runs.
<i>info</i>	INTEGER. If <i>info</i> = 0, the execution is successful. If <i>info</i> = $-i$, the i -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `ungqr` interface are the following:

<i>a</i>	Holds the matrix A of size (m,n) .
<i>tau</i>	Holds the vector of length (k) .

Application Notes

For better performance, try using $lwork = n * blocksize$, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set $lwork = -1$.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If $lwork = -1$, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed Q differs from an exactly unitary matrix by a matrix E such that $\|E\|_2 = O(\epsilon) * \|A\|_2$, where ϵ is the machine precision.

The total number of floating-point operations is approximately $16 * m * n * k - 8 * (m + n) * k^2 + (16/3) * k^3$.

If $n = k$, the number is approximately $(8/3) * n^2 * (3m - n)$.

The real counterpart of this routine is [orgqr](#).

?unmqr

Multiplies a complex matrix by the unitary matrix Q of the QR factorization formed by ?geqrf.

Syntax

```
call cunmqr(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call zunmqr(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call unmqr(a, tau, c [,side] [,trans] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine multiplies a rectangular complex matrix C by Q or Q^H , where Q is the unitary matrix Q of the QR factorization formed by the routines [geqrf](#) or [geqpf](#).

Depending on the parameters *side* and *trans*, the routine can form one of the matrix products $Q*C$, Q^H*C , $C*Q$, or $C*Q^H$ (overwriting the result on C).

Input Parameters

<i>side</i>	<p>CHARACTER*1. Must be either 'L' or 'R'.</p> <p>If <i>side</i> = 'L', Q or Q^H is applied to C from the left.</p> <p>If <i>side</i> = 'R', Q or Q^H is applied to C from the right.</p>
<i>trans</i>	<p>CHARACTER*1. Must be either 'N' or 'C'.</p> <p>If <i>trans</i> = 'N', the routine multiplies C by Q.</p> <p>If <i>trans</i> = 'C', the routine multiplies C by Q^H.</p>
<i>m</i>	INTEGER. The number of rows in the matrix C ($m \geq 0$).
<i>n</i>	INTEGER. The number of columns in C ($n \geq 0$).
<i>k</i>	<p>INTEGER. The number of elementary reflectors whose product defines the matrix Q. Constraints:</p> <p>$0 \leq k \leq m$ if <i>side</i> = 'L';</p> <p>$0 \leq k \leq n$ if <i>side</i> = 'R'.</p>
<i>a</i> , <i>c</i> , <i>tau</i> , <i>work</i>	<p>COMPLEX for cgeqrf</p> <p>DOUBLE COMPLEX for zgeqrf.</p> <p>Arrays:</p> <p><i>a</i>(<i>lda</i>,*) and <i>tau</i>(*) are the arrays returned by cgeqrf / zgeqrf or cgeqpf / zgeqpf.</p> <p>The second dimension of <i>a</i> must be at least $\max(1, k)$.</p> <p>The size of <i>tau</i> must be at least $\max(1, k)$.</p> <p><i>c</i>(<i>ldc</i>,*) contains the m-by-n matrix C.</p> <p>The second dimension of <i>c</i> must be at least $\max(1, n)$</p>

work is a workspace array, its dimension $\max(1, lwork)$.

lda INTEGER. The leading dimension of *a*. Constraints:

$lda \geq \max(1, m)$ if *side* = 'L';

$lda \geq \max(1, n)$ if *side* = 'R'.

ldc INTEGER. The leading dimension of *c*. Constraint:

$ldc \geq \max(1, m)$.

lwork INTEGER. The size of the *work* array. Constraints:

$lwork \geq \max(1, n)$ if *side* = 'L';

$lwork \geq \max(1, m)$ if *side* = 'R'.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by [xerbla](#).

See *Application notes* for the suggested value of *lwork*.

Output Parameters

c Overwritten by the product Q^*C , $Q^H C$, C^*Q , or C^*Q^H (as specified by *side* and *trans*).

work(1) If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

info INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `unmqr` interface are the following:

a Holds the matrix *A* of size (*r*,*k*).

$r = m$ if *side* = 'L'.

$r = n$ if *side* = 'R'.

tau Holds the vector of length (*k*).

c Holds the matrix *C* of size (*m*,*n*).

side Must be 'L' or 'R'. The default value is 'L'.

trans Must be 'N' or 'C'. The default value is 'N'.

Application Notes

For better performance, try using `lwork = n*blocksize` (if `side = 'L'`) or `lwork = m*blocksize` (if `side = 'R'`) where `blocksize` is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If it is not clear how much workspace to supply, use a generous value of `lwork` for the first run, or set `lwork = -1`.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array `work` on exit. Use this value (`work(1)`) for subsequent runs.

If `lwork = -1`, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (`work`). This operation is called a workspace query.

Note that if `lwork` is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The real counterpart of this routine is [ormqr](#).

?gelqf

Computes the LQ factorization of a general m -by- n matrix.

Syntax

```
call sgelqf(m, n, a, lda, tau, work, lwork, info)
call dgelqf(m, n, a, lda, tau, work, lwork, info)
call cgelqf(m, n, a, lda, tau, work, lwork, info)
call zgelqf(m, n, a, lda, tau, work, lwork, info)
call gelqf(a [, tau] [,info])
```

Include Files

- `mk1.fi`, `lapack.f90`

Description

The routine forms the *LQ* factorization of a general m -by- n matrix A (see [Orthogonal Factorizations](#)). No pivoting is performed.

The routine does not form the matrix Q explicitly. Instead, Q is represented as a product of $\min(m, n)$ *elementary reflectors*. Routines are provided to work with Q in this representation.

NOTE

This routine supports the Progress Routine feature. See [Progress Function](#) section for details.

Input Parameters

<code>m</code>	INTEGER. The number of rows in the matrix A ($m \geq 0$).
<code>n</code>	INTEGER. The number of columns in A ($n \geq 0$).
<code>a, work</code>	REAL for <code>sgelqf</code> DOUBLE PRECISION for <code>dgelqf</code>

COMPLEX for `cgelqf`

DOUBLE COMPLEX for `zgelqf`.

Arrays:

Array $a(la,*)$ contains the matrix A .

The second dimension of a must be at least $\max(1, n)$.

$work$ is a workspace array, its dimension $\max(1, lwork)$.

lda INTEGER. The leading dimension of a ; at least $\max(1, m)$.

$lwork$ INTEGER. The size of the $work$ array; at least $\max(1, m)$.

If $lwork = -1$, then a workspace query is assumed; the routine only calculates the optimal size of the $work$ array, returns this value as the first entry of the $work$ array, and no error message related to $lwork$ is issued by [xerbla](#).

See *Application Notes* for the suggested value of $lwork$.

Output Parameters

a Overwritten by the factorization data as follows:

The elements on and below the diagonal of the array contain the m -by- $\min(m, n)$ lower trapezoidal matrix R (R is lower triangular if $m \leq n$); the elements above the diagonal, with the array tau , represent the orthogonal matrix Q as a product of elementary reflectors.

tau REAL for `sgelqf`
DOUBLE PRECISION for `dgelqf`
COMPLEX for `cgelqf`
DOUBLE COMPLEX for `zgelqf`.

Array, size at least $\max(1, \min(m, n))$.

Contains scalars that define elementary reflectors for the matrix Q (see [Orthogonal Factorizations](#)).

$work(1)$ If $info = 0$, on exit $work(1)$ contains the minimum value of $lwork$ required for optimum performance. Use this $lwork$ for subsequent runs.

$info$ INTEGER.

If $info = 0$, the execution is successful.

If $info = -i$, the i -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `gelqf` interface are the following:

a Holds the matrix A of size (m, n) .

tau Holds the vector of length $\min(m,n)$.

Application Notes

For better performance, try using $lwork = m * blocksize$, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set $lwork = -1$.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set $lwork = -1$, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed factorization is the exact factorization of a matrix $A + E$, where

$$\|E\|_2 = O(\epsilon) \|A\|_2.$$

The approximate number of floating-point operations for real flavors is

$$\begin{aligned} (4/3)n^3 & \quad \text{if } m = n, \\ (2/3)n^2(3m-n) & \quad \text{if } m > n, \\ (2/3)m^2(3n-m) & \quad \text{if } m < n. \end{aligned}$$

The number of operations for complex flavors is 4 times greater.

To find the minimum-norm solution of an underdetermined least squares problem minimizing $\|A^*x - b\|_2$ for all columns *b* of a given matrix *B*, you can call the following:

<code>?gelqf</code> (this routine)	to factorize $A = L^*Q$;
<code>trsm</code> (a BLAS routine)	to solve $L^*Y = B$ for <i>Y</i> ;
<code>ormlq</code>	to compute $X = (Q_1)^T * Y$ (for real matrices);
<code>unmlq</code>	to compute $X = (Q_1)^H * Y$ (for complex matrices).

(The columns of the computed *X* are the minimum-norm solution vectors *x*. Here *A* is an *m*-by-*n* matrix with $m < n$; Q_1 denotes the first *m* columns of *Q*).

To compute the elements of *Q* explicitly, call

<code>orglq</code>	(for real matrices)
<code>unglq</code>	(for complex matrices).

[mkl_progress](#)
[Matrix Storage Schemes](#)

?orglq

Generates the real orthogonal matrix Q of the LQ factorization formed by ?gelqf.

Syntax

```
call sorglq(m, n, k, a, lda, tau, work, lwork, info)
call dorglq(m, n, k, a, lda, tau, work, lwork, info)
call orglq(a, tau [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine generates the whole or part of n -by- n orthogonal matrix Q of the LQ factorization formed by the routines [gelqf](#). Use this routine after a call to [sgelqf](#)/[dgelqf](#).

Usually Q is determined from the LQ factorization of an p -by- n matrix A with $n \geq p$. To compute the whole matrix Q , use:

```
call ?orglq(n, n, p, a, lda, tau, work, lwork, info)
```

To compute the leading p rows of Q , which form an orthonormal basis in the space spanned by the rows of A , use:

```
call ?orglq(p, n, p, a, lda, tau, work, lwork, info)
```

To compute the matrix Q^k of the LQ factorization of the leading k rows of A , use:

```
call ?orglq(n, n, k, a, lda, tau, work, lwork, info)
```

To compute the leading k rows of Q^k , which form an orthonormal basis in the space spanned by the leading k rows of A , use:

```
call ?orgqr(k, n, k, a, lda, tau, work, lwork, info)
```

Input Parameters

m	INTEGER. The number of rows of Q to be computed ($0 \leq m \leq n$).
n	INTEGER. The order of the orthogonal matrix Q ($n \geq m$).
k	INTEGER. The number of elementary reflectors whose product defines the matrix Q ($0 \leq k \leq m$).
$a, \tau, work$	REAL for sorglq DOUBLE PRECISION for dorglq Arrays: $a(lda,*)$ and $\tau(*)$ are the arrays returned by sgelqf / dgelqf . The second dimension of a must be at least $\max(1, n)$. The size of τ must be at least $\max(1, k)$. $work$ is a workspace array, its dimension $\max(1, lwork)$.
lda	INTEGER. The leading dimension of a ; at least $\max(1, m)$.

lwork INTEGER. The size of the *work* array; at least $\max(1, m)$.
 If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by [xerbla](#).
 See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a Overwritten by *m* leading rows of the *n*-by-*n* orthogonal matrix *Q*.
work(1) If *info* = 0, on exit *work(1)* contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info INTEGER.
 If *info* = 0, the execution is successful.
 If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `orglq` interface are the following:

a Holds the matrix *A* of size (*m*,*n*).
tau Holds the vector of length (*k*).

Application Notes

For better performance, try using *lwork* = *m***blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work(1)*) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed *Q* differs from an exactly orthogonal matrix by a matrix *E* such that $\|E\|_2 = O(\varepsilon) * \|A\|_2$, where ε is the machine precision.

The total number of floating-point operations is approximately $4 * m * n * k - 2 * (m + n) * k^2 + (4/3) * k^3$.

If *m* = *k*, the number is approximately $(2/3) * m^2 * (3n - m)$.

The complex counterpart of this routine is [unglq](#).

?ormlq

Multiplies a real matrix by the orthogonal matrix Q of the LQ factorization formed by ?gelqf.

Syntax

```
call sormlq(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call dormlq(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call ormlq(a, tau, c [,side] [,trans] [,info])
```

Include Files

Use this value (*work*(1)) for subsequent runs.

If you set *lwork*= -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The complex counterpart of this routine is [unmlq](#).

?unglq

Generates the complex unitary matrix Q of the LQ factorization formed by ?gelqf.

Syntax

```
call cunglq(m, n, k, a, lda, tau, work, lwork, info)
call zunglq(m, n, k, a, lda, tau, work, lwork, info)
call unglq(a, tau [,info])
```

Include Files

- `mk1.fi`, `lapack.f90`

Description

The routine generates the whole or part of *n*-by-*n* unitary matrix *Q* of the *LQ* factorization formed by the routines [gelqf](#). Use this routine after a call to `cgelqf/zgelqf`.

Usually *Q* is determined from the *LQ* factorization of an *p*-by-*n* matrix *A* with $n < p$. To compute the whole matrix *Q*, use:

```
call ?unglq(n, n, p, a, lda, tau, work, lwork, info)
```

To compute the leading *p* rows of *Q*, which form an orthonormal basis in the space spanned by the rows of *A*, use:

```
call ?unglq(p, n, p, a, lda, tau, work, lwork, info)
```

To compute the matrix Q^k of the *LQ* factorization of the leading *k* rows of *A*, use:

```
call ?unglq(n, n, k, a, lda, tau, work, lwork, info)
```

To compute the leading *k* rows of Q^k , which form an orthonormal basis in the space spanned by the leading *k* rows of *A*, use:

```
call ?ungqr(k, n, k, a, lda, tau, work, lwork, info)
```

Input Parameters

<i>m</i>	INTEGER. The number of rows of <i>Q</i> to be computed ($0 \leq m \leq n$).
<i>n</i>	INTEGER. The order of the unitary matrix <i>Q</i> ($n \geq m$).
<i>k</i>	INTEGER. The number of elementary reflectors whose product defines the matrix <i>Q</i> ($0 \leq k \leq m$).
<i>a</i> , <i>tau</i> , <i>work</i>	COMPLEX for <code>cunglq</code>

DOUBLE COMPLEX for `zunglq`

Arrays: $a(lda,*)$ and $tau(*)$ are the arrays returned by `cgelqf/zgelqf`.

The second dimension of a must be at least $\max(1, n)$.

The dimension of tau must be at least $\max(1, k)$.

$work$ is a workspace array, its dimension $\max(1, lwork)$.

lda

INTEGER. The leading dimension of a ; at least $\max(1, m)$.

$lwork$

INTEGER. The size of the $work$ array; at least $\max(1, m)$.

If $lwork = -1$, then a workspace query is assumed; the routine only calculates the optimal size of the $work$ array, returns this value as the first entry of the $work$ array, and no error message related to $lwork$ is issued by [xerbla](#).

See *Application Notes* for the suggested value of $lwork$.

Output Parameters

a

Overwritten by m leading rows of the n -by- n unitary matrix Q .

$work(1)$

If $info = 0$, on exit $work(1)$ contains the minimum value of $lwork$ required for optimum performance. Use this $lwork$ for subsequent runs.

$info$

INTEGER.

If $info = 0$, the execution is successful.

If $info = -i$, the i -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `unglq` interface are the following:

a

Holds the matrix A of size (m,n) .

tau

Holds the vector of length (k) .

Application Notes

For better performance, try using $lwork = m \cdot blocksize$, where $blocksize$ is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If it is not clear how much workspace to supply, use a generous value of $lwork$ for the first run, or set $lwork = -1$.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array $work$ on exit. Use this value ($work(1)$) for subsequent runs.

If $lwork = -1$, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array ($work$). This operation is called a workspace query.

Note that if $lwork$ is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed Q differs from an exactly unitary matrix by a matrix E such that $\|E\|_2 = O(\varepsilon) * \|A\|_2$, where ε is the machine precision.

The total number of floating-point operations is approximately $16*m*n*k - 8*(m+n)*k^2 + (16/3)*k^3$.

If $m = k$, the number is approximately $(8/3)*m^2*(3n - m)$.

The real counterpart of this routine is [orglq](#).

?unmlq

Multiplies a complex matrix by the unitary matrix Q of the LQ factorization formed by ?gelqf.

Syntax

```
call cunmlq(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call zunmlq(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call unmlq(a, tau, c [,side] [,trans] [,info])
```

Include Files

- `mk1.fi`, `lapack.f90`

Description

The routine multiplies a real m -by- n matrix C by Q or Q^H , where Q is the unitary matrix Q of the LQ factorization formed by the routine [gelqf](#).

Depending on the parameters *side* and *trans*, the routine can form one of the matrix products $Q*C$, Q^H*C , $C*Q$, or $C*Q^H$ (overwriting the result on C).

Input Parameters

<i>side</i>	CHARACTER*1. Must be either 'L' or 'R'. If <i>side</i> = 'L', Q or Q^H is applied to C from the left. If <i>side</i> = 'R', Q or Q^H is applied to C from the right.
<i>trans</i>	CHARACTER*1. Must be either 'N' or 'C'. If <i>trans</i> = 'N', the routine multiplies C by Q . If <i>trans</i> = 'C', the routine multiplies C by Q^H .
<i>m</i>	INTEGER. The number of rows in the matrix C ($m \geq 0$).
<i>n</i>	INTEGER. The number of columns in C ($n \geq 0$).
<i>k</i>	INTEGER. The number of elementary reflectors whose product defines the matrix Q . Constraints: $0 \leq k \leq m$ if <i>side</i> = 'L'; $0 \leq k \leq n$ if <i>side</i> = 'R'.
<i>a</i> , <i>c</i> , <i>tau</i> , <i>work</i>	COMPLEX for cunmlq DOUBLE COMPLEX for zunmlq. Arrays:

$a(lda,*)$ and $tau(*)$ are arrays returned by `?gelqf`.

The second dimension of a must be:

at least $\max(1, m)$ if $side = 'L'$;

at least $\max(1, n)$ if $side = 'R'$.

The size of tau must be at least $\max(1, k)$.

$c ldc,*)$ contains the m -by- n matrix C .

The second dimension of c must be at least $\max(1, n)$

$work$ is a workspace array, its dimension $\max(1, lwork)$.

lda INTEGER. The leading dimension of a ; $lda \geq \max(1, k)$.

ldc INTEGER. The leading dimension of c ; $ldc \geq \max(1, m)$.

$lwork$ INTEGER. The size of the $work$ array. Constraints:

$lwork \geq \max(1, n)$ if $side = 'L'$;

$lwork \geq \max(1, m)$ if $side = 'R'$.

If $lwork = -1$, then a workspace query is assumed; the routine only calculates the optimal size of the $work$ array, returns this value as the first entry of the $work$ array, and no error message related to $lwork$ is issued by [xerbla](#).

See *Application Notes* for the suggested value of $lwork$.

Output Parameters

c Overwritten by the product $Q^H C$, $Q^H C$, $C^H Q$, or $C^H Q^H$ (as specified by $side$ and $trans$).

$work(1)$ If $info = 0$, on exit $work(1)$ contains the minimum value of $lwork$ required for optimum performance. Use this $lwork$ for subsequent runs.

$info$ INTEGER.

If $info = 0$, the execution is successful.

If $info = -i$, the i -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `unmlq` interface are the following:

a Holds the matrix A of size (k, m) .

tau Holds the vector of length (k) .

c Holds the matrix C of size (m, n) .

$side$ Must be 'L' or 'R'. The default value is 'L'.

trans Must be 'N' or 'C'. The default value is 'N'.

Application Notes

For better performance, try using $lwork = n \times blocksize$ (if $side = 'L'$) or $lwork = m \times blocksize$ (if $side = 'R'$) where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set $lwork = -1$.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value ($work(1)$) for subsequent runs.

If $lwork = -1$, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The real counterpart of this routine is [ormlq](#).

?geqlf

Computes the QL factorization of a general m-by-n matrix.

Syntax

```
call sgeqlf(m, n, a, lda, tau, work, lwork, info)
call dgeqlf(m, n, a, lda, tau, work, lwork, info)
call cgeqlf(m, n, a, lda, tau, work, lwork, info)
call zgeqlf(m, n, a, lda, tau, work, lwork, info)
call geqlf(a [, tau] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine forms the QL factorization of a general m -by- n matrix A (see [Orthogonal Factorizations](#)). No pivoting is performed.

The routine does not form the matrix Q explicitly. Instead, Q is represented as a product of $\min(m, n)$ *elementary reflectors*. Routines are provided to work with Q in this representation.

NOTE

This routine supports the Progress Routine feature. See [Progress Function](#) section for details.

Input Parameters

m INTEGER. The number of rows in the matrix A ($m \geq 0$).

n INTEGER. The number of columns in A ($n \geq 0$).

<i>a, work</i>	<p>REAL for sgeqlf</p> <p>DOUBLE PRECISION for dgeqlf</p> <p>COMPLEX for cgeqlf</p> <p>DOUBLE COMPLEX for zgeqlf.</p> <p>Arrays:</p> <p>Array <i>a(lda,*)</i> contains the matrix <i>A</i>.</p> <p>The second dimension of <i>a</i> must be at least $\max(1, n)$.</p> <p><i>work</i> is a workspace array, its dimension $\max(1, lwork)$.</p>
<i>lda</i>	INTEGER. The leading dimension of <i>a</i> ; at least $\max(1, m)$.
<i>lwork</i>	<p>INTEGER. The size of the <i>work</i> array; at least $\max(1, n)$.</p> <p>If <i>lwork</i> = -1, then a workspace query is assumed; the routine only calculates the optimal size of the <i>work</i> array, returns this value as the first entry of the <i>work</i> array, and no error message related to <i>lwork</i> is issued by xerbla.</p> <p>See <i>Application Notes</i> for the suggested value of <i>lwork</i>.</p>

Output Parameters

<i>a</i>	<p>Overwritten on exit by the factorization data as follows:</p> <p>if $m \geq n$, the lower triangle of the subarray <i>a</i>(<i>m</i>-<i>n</i>+1:<i>m</i>, 1:<i>n</i>) contains the <i>n</i>-by-<i>n</i> lower triangular matrix <i>L</i>; if $m \leq n$, the elements on and below the (<i>n</i>-<i>m</i>)-th superdiagonal contain the <i>m</i>-by-<i>n</i> lower trapezoidal matrix <i>L</i>; in both cases, the remaining elements, with the array <i>tau</i>, represent the orthogonal/unitary matrix <i>Q</i> as a product of elementary reflectors.</p>
<i>tau</i>	<p>REAL for sgeqlf</p> <p>DOUBLE PRECISION for dgeqlf</p> <p>COMPLEX for cgeqlf</p> <p>DOUBLE COMPLEX for zgeqlf.</p> <p>Array, size at least $\max(1, \min(m, n))$. Contains scalar factors of the elementary reflectors for the matrix <i>Q</i> (see Orthogonal Factorizations).</p>
<i>work</i> (1)	If <i>info</i> = 0, on exit <i>work</i> (1) contains the minimum value of <i>lwork</i> required for optimum performance.
<i>info</i>	<p>INTEGER.</p> <p>If <i>info</i> = 0, the execution is successful.</p> <p>If <i>info</i> = -<i>i</i>, the <i>i</i>-th parameter had an illegal value.</p>

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine *geqlf* interface are the following:

<i>a</i>	Holds the matrix <i>A</i> of size (m,n) .
<i>tau</i>	Holds the vector of length $\min(m,n)$.

Application Notes

For better performance, try using $lwork = n * blocksize$, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set $lwork = -1$.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set $lwork = -1$, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?ormql

Multiplies a real matrix by the orthogonal matrix Q of the QL factorization formed by ?geqlf.

Syntax

```
call sormql(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call dormql(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call ormql(a, tau, c [,side] [,trans] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine multiplies a real m -by- n matrix C by Q or Q^T , where Q is the orthogonal matrix Q of the QL factorization formed by the routine [geqlf](#).

Depending on the parameters *side* and *trans*, the routine [ormql](#) can form one of the matrix products Q^*C , Q^T*C , $C*Q$, or $C*Q^T$ (overwriting the result over C).

Input Parameters

<i>side</i>	CHARACTER*1. Must be either 'L' or 'R'. If <i>side</i> = 'L', Q or Q^T is applied to C from the left. If <i>side</i> = 'R', Q or Q^T is applied to C from the right.
<i>trans</i>	CHARACTER*1. Must be either 'N' or 'T'. If <i>trans</i> = 'N', the routine multiplies C by Q . If <i>trans</i> = 'T', the routine multiplies C by Q^T .
<i>m</i>	INTEGER. The number of rows in the matrix C ($m \geq 0$).
<i>n</i>	INTEGER. The number of columns in C ($n \geq 0$).
<i>k</i>	INTEGER. The number of elementary reflectors whose product defines the matrix Q . Constraints: $0 \leq k \leq m$ if <i>side</i> = 'L'; $0 \leq k \leq n$ if <i>side</i> = 'R'.
<i>a</i> , <i>tau</i> , <i>c</i> , <i>work</i>	REAL for sormql DOUBLE PRECISION for dormql. Arrays: $a(lda,*)$, $tau(*)$, $c(ldc,*)$.

On entry, the i th column of a must contain the vector which defines the elementary reflector H_i , for $i = 1, 2, \dots, k$, as returned by `sgeqlf/dgeqlf` in the last k columns of its array argument a .

The second dimension of a must be at least $\max(1, k)$.

$\tau(i)$ must contain the scalar factor of the elementary reflector H_i , as returned by `sgeqlf/dgeqlf`.

The size of τ must be at least $\max(1, k)$.

$c(ldc,*)$ contains the m -by- n matrix C .

The second dimension of c must be at least $\max(1, n)$

$work$ is a workspace array, its dimension $\max(1, lwork)$.

<code>lda</code>	<p>INTEGER. The leading dimension of a;</p> <p>if <code>side = 'L'</code>, $lda \geq \max(1, m)$;</p> <p>if <code>side = 'R'</code>, $lda \geq \max(1, n)$.</p>
<code>ldc</code>	<p>INTEGER. The leading dimension of c; $ldc \geq \max(1, m)$.</p>
<code>lwork</code>	<p>INTEGER. The size of the $work$ array. Constraints:</p> <p>$lwork \geq \max(1, n)$ if <code>side = 'L'</code>;</p> <p>$lwork \geq \max(1, m)$ if <code>side = 'R'</code>.</p> <p>If $lwork = -1$, then a workspace query is assumed; the routine only calculates the optimal size of the $work$ array, returns this value as the first entry of the $work$ array, and no error message related to $lwork$ is issued by xerbla.</p> <p>See <i>Application Notes</i> for the suggested value of $lwork$.</p>

Output Parameters

<code>c</code>	Overwritten by the product Q^*C , $Q^T C$, C^*Q , or C^*Q^T (as specified by <i>side</i> and <i>trans</i>).
<code>work(1)</code>	If <code>info = 0</code> , on exit <code>work(1)</code> contains the minimum value of $lwork$ required for optimum performance. Use this $lwork$ for subsequent runs.
<code>info</code>	<p>INTEGER.</p> <p>If <code>info = 0</code>, the execution is successful.</p> <p>If <code>info = -i</code>, the i-th parameter had an illegal value.</p>

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `ormql` interface are the following:

a	Holds the matrix A of size (r,k) .
$r = m$ if <code>side = 'L'</code> .	

	$r = n$ if $side = 'R'$.
τ	Holds the vector of length (k) .
c	Holds the matrix C of size (m,n) .
$side$	Must be 'L' or 'R'. The default value is 'L'.
$trans$	Must be 'N' or 'T'. The default value is 'N'.

Application Notes

For better performance, try using $lwork = n*blocksize$ (if $side = 'L'$) or $lwork = m*blocksize$ (if $side = 'R'$) where $blocksize$ is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of $lwork$ for the first run or set $lwork = -1$.

If you choose the first option and set any of admissible $lwork$ sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array $work$ on exit. Use this value ($work(1)$) for subsequent runs.

If you set $lwork = -1$, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array ($work$). This operation is called a workspace query.

Note that if you set $lwork$ to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The complex counterpart of this routine is [unmql](#).

?unmql

Multiplies a complex matrix by the unitary matrix Q of the QL factorization formed by ?geqlf.

Syntax

```
call cunmql(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call zunmql(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call unmql(a, tau, c [,side] [,trans] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine multiplies a complex m -by- n matrix C by Q or Q^H , where Q is the unitary matrix Q of the QL factorization formed by the routine [geqlf](#).

Depending on the parameters $side$ and $trans$, the routine [unmql](#) can form one of the matrix products $Q^H C$, $C^H Q$, or $C Q^H$ (overwriting the result over C).

Input Parameters

$side$	CHARACTER*1. Must be either 'L' or 'R'.
	If $side = 'L'$, Q or Q^H is applied to C from the left.

	If <i>side</i> = 'R', Q or Q^H is applied to C from the right.
<i>trans</i>	CHARACTER*1. Must be either 'N' or 'C'. If <i>trans</i> = 'N', the routine multiplies C by Q . If <i>trans</i> = 'C', the routine multiplies C by Q^H .
<i>m</i>	INTEGER. The number of rows in the matrix C ($m \geq 0$).
<i>n</i>	INTEGER. The number of columns in C ($n \geq 0$).
<i>k</i>	INTEGER. The number of elementary reflectors whose product defines the matrix Q . Constraints: $0 \leq k \leq m$ if <i>side</i> = 'L'; $0 \leq k \leq n$ if <i>side</i> = 'R'.
<i>a</i> , <i>tau</i> , <i>c</i> , <i>work</i>	COMPLEX for cunmql DOUBLE COMPLEX for zunmql. Arrays: <i>a</i> (<i>lda</i> ,*), <i>tau</i> (*), <i>c</i> (<i>ldc</i> ,*), <i>work</i> (<i>lwork</i>). On entry, the i -th column of <i>a</i> must contain the vector which defines the elementary reflector $H(i)$, for $i = 1, 2, \dots, k$, as returned by <code>cgeqlf/zgeqlf</code> in the last k columns of its array argument <i>a</i> . The second dimension of <i>a</i> must be at least $\max(1, k)$. <i>tau</i> (i) must contain the scalar factor of the elementary reflector $H(i)$, as returned by <code>cgeqlf/zgeqlf</code> . The size of <i>tau</i> must be at least $\max(1, k)$. <i>c</i> (<i>ldc</i> ,*) contains the m -by- n matrix C . The second dimension of <i>c</i> must be at least $\max(1, n)$ <i>work</i> is a workspace array, its dimension $\max(1, lwork)$.
<i>lda</i>	INTEGER. The leading dimension of <i>a</i> ; $lda \geq \max(1, n)$.
<i>ldc</i>	INTEGER. The leading dimension of <i>c</i> ; $ldc \geq \max(1, m)$.
<i>lwork</i>	INTEGER. The size of the <i>work</i> array. Constraints: $lwork \geq \max(1, n)$ if <i>side</i> = 'L'; $lwork \geq \max(1, m)$ if <i>side</i> = 'R'. If <i>lwork</i> = -1, then a workspace query is assumed; the routine only calculates the optimal size of the <i>work</i> array, returns this value as the first entry of the <i>work</i> array, and no error message related to <i>lwork</i> is issued by xerbla . See <i>Application Notes</i> for the suggested value of <i>lwork</i> .

Output Parameters

<i>c</i>	Overwritten by the product $Q^H * C$, $Q * C$, $C * Q$, or $C * Q^H$ (as specified by <i>side</i> and <i>trans</i>).
----------	--

<code>work(1)</code>	If <code>info = 0</code> , on exit <code>work(1)</code> contains the minimum value of <code>lwork</code> required for optimum performance. Use this <code>lwork</code> for subsequent runs.
<code>info</code>	INTEGER. If <code>info = 0</code> , the execution is successful. If <code>info = -i</code> , the <i>i</i> -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `unmql` interface are the following:

<code>a</code>	Holds the matrix <i>A</i> of size (<i>r</i> , <i>k</i>). $r = m$ if <code>side = 'L'</code> . $r = n$ if <code>side = 'R'</code> .
<code>tau</code>	Holds the vector of length (<i>k</i>).
<code>c</code>	Holds the matrix <i>C</i> of size (<i>m</i> , <i>n</i>).
<code>side</code>	Must be 'L' or 'R'. The default value is 'L'.
<code>trans</code>	Must be 'N' or 'C'. The default value is 'N'.

Application Notes

For better performance, try using `lwork = n*blocksize` (if `side = 'L'`) or `lwork = m*blocksize` (if `side = 'R'`) where `blocksize` is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If it is not clear how much workspace to supply, use a generous value of `lwork` for the first run, or set `lwork = -1`.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array `work` on exit. Use this value (`work(1)`) for subsequent runs.

If `lwork = -1`, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (`work`). This operation is called a workspace query.

Note that if `lwork` is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The real counterpart of this routine is [ormql](#).

?gerqf

Computes the RQ factorization of a general m-by-n matrix.

Syntax

```
call sgerqf(m, n, a, lda, tau, work, lwork, info)
call dgerqf(m, n, a, lda, tau, work, lwork, info)
call cgerqf(m, n, a, lda, tau, work, lwork, info)
```

```
call zgerqf(m, n, a, lda, tau, work, lwork, info)
call gerqf(a [, tau] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine forms the *RQ* factorization of a general m -by- n matrix A (see [Orthogonal Factorizations](#)). No pivoting is performed.

The routine does not form the matrix Q explicitly. Instead, Q is represented as a product of $\min(m, n)$ *elementary reflectors*. Routines are provided to work with Q in this representation.

NOTE

This routine supports the Progress Routine feature. See [Progress Function](#) section for details.

Input Parameters

m	INTEGER. The number of rows in the matrix A ($m \geq 0$).
n	INTEGER. The number of columns in A ($n \geq 0$).
$a, work$	<p>REAL for sgerqf</p> <p>DOUBLE PRECISION for dgerqf</p> <p>COMPLEX for cgerqf</p> <p>DOUBLE COMPLEX for zgerqf.</p> <p>Arrays:</p> <p>Array $a(lda,*)$ contains the m-by-n matrix A.</p> <p>The second dimension of a must be at least $\max(1, n)$.</p> <p>$work$ is a workspace array, its dimension $\max(1, lwork)$.</p>
lda	INTEGER. The leading dimension of a ; at least $\max(1, m)$.
$lwork$	<p>INTEGER. The size of the $work$ array;</p> <p>$lwork \geq \max(1, m)$.</p> <p>If $lwork = -1$, then a workspace query is assumed; the routine only calculates the optimal size of the $work$ array, returns this value as the first entry of the $work$ array, and no error message related to $lwork$ is issued by xerbla.</p> <p>See Application Notes for the suggested value of $lwork$.</p>

Output Parameters

a	<p>Overwritten on exit by the factorization data as follows:</p> <p>if $m \leq n$, the upper triangle of the subarray</p> <p>$a(1:m, n-m+1:n)$ contains the m-by-m upper triangular matrix R;</p>
-----	--

if $m \geq n$, the elements on and above the $(m-n)$ th subdiagonal contain the m -by- n upper trapezoidal matrix R ;

in both cases, the remaining elements, with the array *tau*, represent the orthogonal/unitary matrix Q as a product of $\min(m, n)$ elementary reflectors.

<i>tau</i>	<p>REAL for sgerqf</p> <p>DOUBLE PRECISION for dgerqf</p> <p>COMPLEX for cgerqf</p> <p>DOUBLE COMPLEX for zgerqf.</p> <p>Array, size at least $\max(1, \min(m, n))$. (See Orthogonal Factorizations.)</p> <p>Contains scalar factors of the elementary reflectors for the matrix Q.</p>
<i>work</i> (1)	If <i>info</i> = 0, on exit <i>work</i> (1) contains the minimum value of <i>lwork</i> required for optimum performance.
<i>info</i>	<p>INTEGER.</p> <p>If <i>info</i> = 0, the execution is successful.</p> <p>If <i>info</i> = -<i>i</i>, the <i>i</i>-th parameter had an illegal value.</p>

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine *gerqf* interface are the following:

<i>a</i>	Holds the matrix A of size (m, n) .
<i>tau</i>	Holds the vector of length $\min(m, n)$.

Application Notes

For better performance, try using *lwork* = $m \times \text{blocksize}$, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?orgrq

Generates the real matrix Q of the RQ factorization formed by ?gerqf.

Syntax

```
call sorgrq(m, n, k, a, lda, tau, work, lwork, info)
call dorgrq(m, n, k, a, lda, tau, work, lwork, info)
call orgrq(a, tau [,info])
```

Include Files

- `mkl.fi`, `lapack.f90`

Description

The routine generates an m -by- n real matrix with orthonormal rows, which is defined as the last m rows of a product of k elementary reflectors $H(i)$ of order n : $Q = H(1) * H(2) * \dots * H(k)$ as returned by the routines [gerqf](#). Use this routine after a call to `sgerqf/dgerqf`.

Input Parameters

m	INTEGER. The number of rows of the matrix Q ($m \geq 0$).
n	INTEGER. The number of columns of the matrix Q ($n \geq m$).
k	INTEGER. The number of elementary reflectors whose product defines the matrix Q ($m \geq k \geq 0$).
$a, \tau, work$	<p>REAL for <code>sorgrq</code> DOUBLE PRECISION for <code>dorgrq</code></p> <p>Arrays: $a(lda,*)$, $\tau(*)$.</p> <p>On entry, the $(m - k + i)$-th row of a must contain the vector which defines the elementary reflector $H(i)$, for $i = 1, 2, \dots, k$, as returned by <code>sgerqf/dgerqf</code> in the last k rows of its array argument a;</p> <p>$\tau(i)$ must contain the scalar factor of the elementary reflector $H(i)$, as returned by <code>sgerqf/dgerqf</code>;</p> <p>The second dimension of a must be at least $\max(1, n)$.</p> <p>The size of τ must be at least $\max(1, k)$.</p> <p>$work$ is a workspace array, its dimension $\max(1, lwork)$.</p>

<i>lda</i>	INTEGER. The leading dimension of <i>a</i> ; at least $\max(1, m)$.
<i>lwork</i>	<p>INTEGER. The size of the <i>work</i> array; at least $\max(1, m)$.</p> <p>If <i>lwork</i> = -1, then a workspace query is assumed; the routine only calculates the optimal size of the <i>work</i> array, returns this value as the first entry of the <i>work</i> array, and no error message related to <i>lwork</i> is issued by xerbla.</p> <p>See <i>Application Notes</i> for the suggested value of <i>lwork</i>.</p>

Output Parameters

<i>a</i>	Overwritten by the last <i>m</i> rows of the <i>n</i> -by- <i>n</i> orthogonal matrix <i>Q</i> .
<i>work</i> (1)	If <i>info</i> = 0, on exit <i>work</i> (1) contains the minimum value of <i>lwork</i> required for optimum performance. Use this <i>lwork</i> for subsequent runs.
<i>info</i>	<p>INTEGER.</p> <p>If <i>info</i> = 0, the execution is successful.</p> <p>If <i>info</i> = -<i>i</i>, the <i>i</i>-th parameter had an illegal value.</p>

?ormrq

*Multiplies a real matrix by the orthogonal matrix *Q* of the RQ factorization formed by ?gerqf.*

Syntax

```
call sormrq(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call dormrq(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call ormqr(a, tau, c [,side] [,trans] [,info])
```

Include Files

- `mkl.fi`, `lapack.f90`

Description

The routine multiplies a real *m*-by-*n* matrix *C* by *Q* or *Q*^T, where *Q* is the real orthogonal matrix defined as a product of *k* elementary reflectors *H_i* : $Q = H_1 H_2 \dots H_k$ as returned by the RQ factorization routine [gerqf](#).

Depending on the parameters *side* and *trans*, the routine can form one of the matrix products Q^*C , $Q^T C$, C^*Q , or $C^T Q$ (overwriting the result over C).

Input Parameters

<i>side</i>	<p>CHARACTER*1. Must be either 'L' or 'R'.</p> <p>If <i>side</i> = 'L', Q or Q^T is applied to C from the left.</p> <p>If <i>side</i> = 'R', Q or Q^T is applied to C from the right.</p>
<i>trans</i>	<p>CHARACTER*1. Must be either 'N' or 'T'.</p> <p>If <i>trans</i> = 'N', the routine multiplies C by Q.</p> <p>If <i>trans</i> = 'T', the routine multiplies C by Q^T.</p>
<i>m</i>	INTEGER. The number of rows in the matrix C ($m \geq 0$).
<i>n</i>	INTEGER. The number of columns in C ($n \geq 0$).
<i>k</i>	<p>INTEGER. The number of elementary reflectors whose product defines the matrix Q. Constraints:</p> <p>$0 \leq k \leq m$, if <i>side</i> = 'L';</p> <p>$0 \leq k \leq n$, if <i>side</i> = 'R'.</p>
<i>a</i> , <i>tau</i> , <i>c</i> , <i>work</i>	<p>REAL for <code>sormrq</code></p> <p>DOUBLE PRECISION for <code>dormrq</code>.</p> <p>Arrays: <i>a</i>(<i>lda</i>,*), <i>tau</i>(*), <i>c</i>(<i>ldc</i>,*).</p> <p>On entry, the <i>i</i>th row of <i>a</i> must contain the vector which defines the elementary reflector H_i, for $i = 1, 2, \dots, k$, as returned by <code>sgerqf/dgerqf</code> in the last k rows of its array argument <i>a</i>.</p> <p>The second dimension of <i>a</i> must be at least $\max(1, m)$ if <i>side</i> = 'L', and at least $\max(1, n)$ if <i>side</i> = 'R'.</p> <p><i>tau</i>(<i>i</i>) must contain the scalar factor of the elementary reflector H_i, as returned by <code>sgerqf/dgerqf</code>.</p> <p>The size of <i>tau</i> must be at least $\max(1, k)$.</p> <p><i>c</i>(<i>ldc</i>,*) contains the m-by-n matrix C.</p> <p>The second dimension of <i>c</i> must be at least $\max(1, n)$</p> <p><i>work</i> is a workspace array, its dimension $\max(1, lwork)$.</p>
<i>lda</i>	INTEGER. The leading dimension of <i>a</i> ; $lda \geq \max(1, k)$.
<i>ldc</i>	INTEGER. The leading dimension of <i>c</i> ; $ldc \geq \max(1, m)$.
<i>lwork</i>	<p>INTEGER. The size of the <i>work</i> array. Constraints:</p> <p>$lwork \geq \max(1, n)$ if <i>side</i> = 'L';</p> <p>$lwork \geq \max(1, m)$ if <i>side</i> = 'R'.</p>

If $lwork = -1$, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by [xerbla](#).

See *Application Notes* for the suggested value of *lwork*.

Output Parameters

<i>c</i>	Overwritten by the product Q^*C , $Q^T C$, C^*Q , or C^*Q^T (as specified by <i>side</i> and <i>trans</i>).
<i>work</i> (1)	If <i>info</i> = 0, on exit <i>work</i> (1) contains the minimum value of <i>lwork</i> required for optimum performance. Use this <i>lwork</i> for subsequent runs.
<i>info</i>	INTEGER. If <i>info</i> = 0, the execution is successful. If <i>info</i> = - <i>i</i> , the <i>i</i> -th parameter had an illegal value.

LAPACK 95 Interface Notes

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The complex counterpart of this routine is [unmrq](#).

?unmrq

Multiplies a complex matrix by the unitary matrix Q of the RQ factorization formed by ?gerqf.

Syntax

```
call cunmrq(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call zunmrq(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call unmrq(a, tau, c [,side] [,trans] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine multiplies a complex m -by- n matrix C by Q or Q^H , where Q is the complex unitary matrix defined as a product of k elementary reflectors $H(i)$ of order n : $Q = H(1)^H \cdot H(2)^H \cdot \dots \cdot H(k)^H$ as returned by the RQ factorization routine [gerqf](#).

Depending on the parameters *side* and *trans*, the routine can form one of the matrix products $Q^H C$, $Q^H C$, $C Q$, or $C Q^H$ (overwriting the result over C).

Input Parameters

<i>side</i>	<p>CHARACTER*1. Must be either 'L' or 'R'.</p> <p>If <i>side</i> = 'L', Q or Q^H is applied to C from the left.</p> <p>If <i>side</i> = 'R', Q or Q^H is applied to C from the right.</p>
<i>trans</i>	<p>CHARACTER*1. Must be either 'N' or 'C'.</p> <p>If <i>trans</i> = 'N', the routine multiplies C by Q.</p> <p>If <i>trans</i> = 'C', the routine multiplies C by Q^H.</p>
<i>m</i>	INTEGER. The number of rows in the matrix C ($m \geq 0$).
<i>n</i>	INTEGER. The number of columns in C ($n \geq 0$).
<i>k</i>	<p>INTEGER. The number of elementary reflectors whose product defines the matrix Q. Constraints:</p> <p>$0 \leq k \leq m$, if <i>side</i> = 'L';</p> <p>$0 \leq k \leq n$, if <i>side</i> = 'R'.</p>
<i>a</i> , <i>tau</i> , <i>c</i> , <i>work</i>	<p>COMPLEX for cunmrq</p> <p>DOUBLE COMPLEX for zunmrq.</p> <p>Arrays: <i>a</i>(<i>lda</i>,*), <i>tau</i>(*), <i>c</i>(<i>ldc</i>,*), <i>work</i>(<i>lwork</i>).</p> <p>On entry, the ith row of <i>a</i> must contain the vector which defines the elementary reflector $H(i)$, for $i = 1, 2, \dots, k$, as returned by cgerqf/zgerqf in the last k rows of its array argument <i>a</i>.</p> <p>The second dimension of <i>a</i> must be at least $\max(1, m)$ if <i>side</i> = 'L', and at least $\max(1, n)$ if <i>side</i> = 'R'.</p>

$\tau(i)$ must contain the scalar factor of the elementary reflector $H(i)$, as returned by `cgerqf/zgerqf`.

The size of τ must be at least $\max(1, k)$.

$c(ldc,*)$ contains the m -by- n matrix C .

The second dimension of c must be at least $\max(1, n)$

$work$ is a workspace array, its dimension $\max(1, lwork)$.

lda INTEGER. The leading dimension of a ; $lda \geq \max(1, k)$.

ldc INTEGER. The leading dimension of c ; $ldc \geq \max(1, m)$.

lwork INTEGER. The size of the $work$ array. Constraints:

$lwork \geq \max(1, n)$ if $side = 'L'$;

$lwork \geq \max(1, m)$ if $side = 'R'$.

If $lwork = -1$, then a workspace query is assumed; the routine only calculates the optimal size of the $work$ array, returns this value as the first entry of the $work$ array, and no error message related to $lwork$ is issued by [xerbla](#).

See *Application Notes* for the suggested value of $lwork$.

Output Parameters

c Overwritten by the product $Q*C$, Q^H*C , $C*Q$, or $C*Q^H$ (as specified by $side$ and $trans$).

$work(1)$ If $info = 0$, on exit $work(1)$ contains the minimum value of $lwork$ required for optimum performance. Use this $lwork$ for subsequent runs.

info INTEGER.

If $info = 0$, the execution is successful.

If $info = -i$, the i -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `unmrq` interface are the following:

a Holds the matrix A of size (k, m) .

tau Holds the vector of length (k) .

c Holds the matrix C of size (m, n) .

side Must be 'L' or 'R'. The default value is 'L'.

trans Must be 'N' or 'C'. The default value is 'N'.

Application Notes

For better performance, try using $lwork = n * blocksize$ (if $side = 'L'$) or $lwork = m * blocksize$ (if $side = 'R'$) where $blocksize$ is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If it is not clear how much workspace to supply, use a generous value of $lwork$ for the first run, or set $lwork = -1$.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array $work$ on exit. Use this value ($work(1)$) for subsequent runs.

If $lwork = -1$, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array ($work$). This operation is called a workspace query.

Note that if $lwork$ is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The real counterpart of this routine is [ormrq](#).

?tzzrf

Reduces the upper trapezoidal matrix A to upper triangular form.

Syntax

```
call stzzrf(m, n, a, lda, tau, work, lwork, info)
call dtzzrf(m, n, a, lda, tau, work, lwork, info)
call ctzzrf(m, n, a, lda, tau, work, lwork, info)
call ztzzrf(m, n, a, lda, tau, work, lwork, info)
call tzzrf(a [, tau] [,info])
```

Include Files

- `mkl.fi`, `lapack.f90`

Description

The routine reduces the m -by- n ($m \leq n$) real/complex upper trapezoidal matrix A to upper triangular form by means of orthogonal/unitary transformations. The upper trapezoidal matrix $A = [A1 \ A2] = [A_{1:m, 1:m}, A_{1:m, m+1:n}]$ is factored as

$$A = [R \ 0] * Z,$$

where Z is an n -by- n orthogonal/unitary matrix, R is an m -by- m upper triangular matrix, and 0 is the m -by- $(n-m)$ zero matrix.

See [larz](#) that applies an elementary reflector returned by `?tzzrf` to a general matrix.

The `?tzzrf` routine replaces the deprecated `?tzzqf` routine.

Input Parameters

m	INTEGER. The number of rows in the matrix A ($m \geq 0$).
n	INTEGER. The number of columns in A ($n \geq m$).
$a, work$	REAL for <code>stzzrf</code>

DOUBLE PRECISION for dtzrzf

COMPLEX for ctzrzf

DOUBLE COMPLEX for ztzrzf.

Arrays: $a(lda,*)$, $work(lwork)$.

The leading m -by- n upper trapezoidal part of the array a contains the matrix A to be factorized.

The second dimension of a must be at least $\max(1, n)$.

$work$ is a workspace array, its dimension $\max(1, lwork)$.

lda

INTEGER. The leading dimension of a ; at least $\max(1, m)$.

$lwork$

INTEGER. The size of the $work$ array;

$lwork \geq \max(1, m)$.

If $lwork = -1$, then a workspace query is assumed; the routine only calculates the optimal size of the $work$ array, returns this value as the first entry of the $work$ array, and no error message related to $lwork$ is issued by [xerbla](#).

See *Application Notes* for the suggested value of $lwork$.

Output Parameters

a

Overwritten on exit by the factorization data as follows:

the leading m -by- m upper triangular part of a contains the upper triangular matrix R , and elements $m+1$ to n of the first m rows of a , with the array τ , represent the orthogonal matrix Z as a product of m elementary reflectors.

τ

REAL for stzrzf

DOUBLE PRECISION for dtzrzf

COMPLEX for ctzrzf

DOUBLE COMPLEX for ztzrzf.

Array, size at least $\max(1, m)$. Contains scalar factors of the elementary reflectors for the matrix Z .

$work(1)$

If $info = 0$, on exit $work(1)$ contains the minimum value of $lwork$ required for optimum performance. Use this $lwork$ for subsequent runs.

$info$

INTEGER.

If $info = 0$, the execution is successful.

If $info = -i$, the i -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `tzrzf` interface are the following:

a	Holds the matrix A of size (m,n) .
τ	Holds the vector of length (m) .

Application Notes

The factorization is obtained by Householder's method. The k -th transformation matrix, $Z(k)$, which is used to introduce zeros into the $(m - k + 1)$ -th row of A , is given in the form

$$Z(k) = \begin{bmatrix} I & 0 \\ 0 & T(k) \end{bmatrix}$$

where for real flavors

$$T(k) = I - \tau u u^T, \quad u(k) = \begin{bmatrix} 1 \\ 0 \\ z(k) \end{bmatrix}$$

and for complex flavors

$$T(k) = I - \tau u u^H, \quad u(k) = \begin{bmatrix} 1 \\ 0 \\ z(k) \end{bmatrix}$$

τ is a scalar and $z(k)$ is an l -element vector. τ and $z(k)$ are chosen to annihilate the elements of the k -th row of A .

The scalar τ is returned in the k -th element of τ and the vector $u(k)$ in the k -th row of A , such that the elements of $z(k)$ are stored in $a(k, m+1), \dots, a(k, n)$.

The elements of R are returned in the upper triangular part of A .

The matrix Z is given by

$$Z = Z(1) * Z(2) * \dots * Z(m).$$

For better performance, try using $lwork = m * blocksize$, where $blocksize$ is a machine-dependent value (typically, 16 to 64) required for optimum performance of the blocked algorithm.

If it is not clear how much workspace to supply, use a generous value of $lwork$ for the first run, or set $lwork = -1$.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array $work$ on exit. Use this value ($work(1)$) for subsequent runs.

If $lwork = -1$, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array ($work$). This operation is called a workspace query.

Note that if $lwork$ is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

Related routines include:

<code>ormrz</code>	to apply matrix Q (for real matrices)
<code>unmrz</code>	to apply matrix Q (for complex matrices).

`?ormrz`

Multiplies a real matrix by the orthogonal matrix defined from the factorization formed by `?tzzrf`.

Syntax

```
call sormrz(side, trans, m, n, k, l, a, lda, tau, c, ldc, work, lwork, info)
call dormrz(side, trans, m, n, k, l, a, lda, tau, c, ldc, work, lwork, info)
call ormz(a, tau, c, l [, side] [,trans] [,info])
```

Include Files

- `mk1.fi`, `lapack.f90`

Description

The `?ormrz` routine multiplies a real m -by- n matrix C by Q or Q^T , where Q is the real orthogonal matrix defined as a product of k elementary reflectors $H(i)$ of order n : $Q = H(1) * H(2) * \dots * H(k)$ as returned by the factorization routine `tzzrf`.

Depending on the parameters `side` and `trans`, the routine can form one of the matrix products Q^*C , $Q^T * C$, C^*Q , or C^*Q^T (overwriting the result over C).

The matrix Q is of order m if `side` = 'L' and of order n if `side` = 'R'.

The `?ormrz` routine replaces the deprecated `?latzm` routine.

Input Parameters

<code>side</code>	CHARACTER*1. Must be either 'L' or 'R'. If <code>side</code> = 'L', Q or Q^T is applied to C from the left. If <code>side</code> = 'R', Q or Q^T is applied to C from the right.
<code>trans</code>	CHARACTER*1. Must be either 'N' or 'T'. If <code>trans</code> = 'N', the routine multiplies C by Q . If <code>trans</code> = 'T', the routine multiplies C by Q^T .
<code>m</code>	INTEGER. The number of rows in the matrix C ($m \geq 0$).
<code>n</code>	INTEGER. The number of columns in C ($n \geq 0$).
<code>k</code>	INTEGER. The number of elementary reflectors whose product defines the matrix Q . Constraints: $0 \leq k \leq m$, if <code>side</code> = 'L'; $0 \leq k \leq n$, if <code>side</code> = 'R'.
<code>l</code>	INTEGER.

The number of columns of the matrix A containing the meaningful part of the Householder reflectors. Constraints:

$0 \leq l \leq m$, if $side = 'L'$;

$0 \leq l \leq n$, if $side = 'R'$.

$a, tau, c, work$

REAL for `sormrz`

DOUBLE PRECISION for `dormrz`.

Arrays: $a(lda,*)$, $tau(*)$, $c ldc,*)$.

On entry, the i th row of a must contain the vector which defines the elementary reflector $H(i)$, for $i = 1, 2, \dots, k$, as returned by `stzrzf/dtzrzf` in the last k rows of its array argument a .

The second dimension of a must be at least $\max(1, m)$ if $side = 'L'$, and at least $\max(1, n)$ if $side = 'R'$.

$tau(i)$ must contain the scalar factor of the elementary reflector $H(i)$, as returned by `stzrzf/dtzrzf`.

The size of tau must be at least $\max(1, k)$.

$c ldc,*)$ contains the m -by- n matrix C .

The second dimension of c must be at least $\max(1, n)$

$work$ is a workspace array, its dimension $\max(1, lwork)$.

lda

INTEGER. The leading dimension of a ; $lda \geq \max(1, k)$.

ldc

INTEGER. The leading dimension of c ; $ldc \geq \max(1, m)$.

$lwork$

INTEGER. The size of the $work$ array. Constraints:

$lwork \geq \max(1, n)$ if $side = 'L'$;

$lwork \geq \max(1, m)$ if $side = 'R'$.

If $lwork = -1$, then a workspace query is assumed; the routine only calculates the optimal size of the $work$ array, returns this value as the first entry of the $work$ array, and no error message related to $lwork$ is issued by [xerbla](#).

See *Application Notes* for the suggested value of $lwork$.

Output Parameters

c

Overwritten by the product Q^*C , $Q^T C$, C^*Q , or C^*Q^T (as specified by $side$ and $trans$).

$work(1)$

If $info = 0$, on exit $work(1)$ contains the minimum value of $lwork$ required for optimum performance. Use this $lwork$ for subsequent runs.

$info$

INTEGER.

If $info = 0$, the execution is successful.

If $info = -i$, the i -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `ormrz` interface are the following:

<code>a</code>	Holds the matrix A of size (k,m) .
<code>tau</code>	Holds the vector of length (k) .
<code>c</code>	Holds the matrix C of size (m,n) .
<code>side</code>	Must be 'L' or 'R'. The default value is 'L'.
<code>trans</code>	Must be 'N' or 'T'. The default value is 'N'.

Application Notes

For better performance, try using `lwork = n*blocksize` (if `side = 'L'`) or `lwork = m*blocksize` (if `side = 'R'`) where `blocksize` is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of `lwork` for the first run or set `lwork = -1`.

If you choose the first option and set any of admissible `lwork` sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array `work` on exit. Use this value (`work(1)`) for subsequent runs.

If you set `lwork = -1`, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (`work`). This operation is called a workspace query.

Note that if you set `lwork` to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The complex counterpart of this routine is [unmrz](#).

?unmrz

Multiplies a complex matrix by the unitary matrix defined from the factorization formed by ?tzrzf.

Syntax

```
call cunmrz(side, trans, m, n, k, l, a, lda, tau, c, ldc, work, lwork, info)
call zunmrz(side, trans, m, n, k, l, a, lda, tau, c, ldc, work, lwork, info)
call unmrz(a, tau, c, l [,side] [,trans] [,info])
```

Include Files

- `mk1.fi`, `lapack.f90`

Description

The routine multiplies a complex m -by- n matrix C by Q or Q^H , where Q is the unitary matrix defined as a product of k elementary reflectors $H(i)$:

$Q = H(1)^H * H(2)^H * \dots * H(k)^H$ as returned by the factorization routine [tzrzf](#).

Depending on the parameters *side* and *trans*, the routine can form one of the matrix products Q^*C , Q^H^*C , C^*Q , or C^*Q^H (overwriting the result over C).

The matrix Q is of order m if *side* = 'L' and of order n if *side* = 'R'.

Input Parameters

<i>side</i>	<p>CHARACTER*1. Must be either 'L' or 'R'.</p> <p>If <i>side</i> = 'L', Q or Q^H is applied to C from the left.</p> <p>If <i>side</i> = 'R', Q or Q^H is applied to C from the right.</p>

Application Notes

For better performance, try using $lwork = n \cdot blocksize$ (if *side* = 'L') or $lwork = m \cdot blocksize$ (if *side* = 'R') where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set *lwork* = -1.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If $lwork = -1$, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if $lwork$ is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The real counterpart of this routine is [ormrz](#).

?ggqrf

Computes the generalized QR factorization of two matrices.

Syntax

```
call sggqrf(n, m, p, a, lda, taua, b, ldb, taub, work, lwork, info)
call dggqrf(n, m, p, a, lda, taua, b, ldb, taub, work, lwork, info)
call cggqrf(n, m, p, a, lda, taua, b, ldb, taub, work, lwork, info)
call zggqrf(n, m, p, a, lda, taua, b, ldb, taub, work, lwork, info)
call ggqrf(a, b [,taua] [,taub] [,info])
```

Include Files

- `mkl.fi`, `lapack.f90`

Description

The routine forms the generalized QR factorization of an n -by- m matrix A and an n -by- p matrix B as $A = Q^*R$, $B = Q^*T^*Z$, where Q is an n -by- n orthogonal/unitary matrix, Z is a p -by- p orthogonal/unitary matrix, and R and T assume one of the forms:

$$R = \begin{matrix} & & m \\ & m & \\ n - m & \begin{pmatrix} R_{11} \\ 0 \end{pmatrix} \end{matrix}, \quad \text{if } n \geq m$$

or

$$R = \begin{matrix} n & m - n \\ n & \begin{pmatrix} R_{11} & R_{12} \end{pmatrix} \end{matrix}, \quad \text{if } n < m$$

where R_{11} is upper triangular, and

$$T = \begin{matrix} p - n & n \\ n & \begin{pmatrix} 0 & T_{12} \end{pmatrix} \end{matrix}, \quad \text{if } n \leq p,$$

$$T = \begin{pmatrix} n-p & & \\ & p & \\ & & p \end{pmatrix} \begin{pmatrix} T_{11} \\ T_{21} \end{pmatrix}, \quad \text{if } n > p,$$

where T_{12} or T_{21} is a p -by- p upper triangular matrix.

In particular, if B is square and nonsingular, the GQR factorization of A and B implicitly gives the QR factorization of $B^{-1}A$ as:

$B^{-1}A = Z^T (T^{-1}R)$ (for real flavors) or $B^{-1}A = Z^H (T^{-1}R)$ (for complex flavors).

Input Parameters

n	INTEGER. The number of rows of the matrices A and B ($n \geq 0$).
m	INTEGER. The number of columns in A ($m \geq 0$).
p	INTEGER. The number of columns in B ($p \geq 0$).
$a, b, work$	<p>REAL for sggqrf DOUBLE PRECISION for dggqrf COMPLEX for cggqrf DOUBLE COMPLEX for zggqrf.</p> <p>Arrays: $a(lda,*)$ contains the matrix A. The second dimension of a must be at least $\max(1, m)$. $b(l db,*)$ contains the matrix B. The second dimension of b must be at least $\max(1, p)$. $work$ is a workspace array, its dimension $\max(1, lwork)$.</p>
lda	INTEGER. The leading dimension of a ; at least $\max(1, n)$.
ldb	INTEGER. The leading dimension of b ; at least $\max(1, n)$.
$lwork$	<p>INTEGER. The size of the $work$ array; must be at least $\max(1, n, m, p)$. If $lwork = -1$, then a workspace query is assumed; the routine only calculates the optimal size of the $work$ array, returns this value as the first entry of the $work$ array, and no error message related to $lwork$ is issued by xerbla. See <i>Application Notes</i> for the suggested value of $lwork$.</p>

Output Parameters

a, b	<p>Overwritten by the factorization data as follows:</p> <p>on exit, the elements on and above the diagonal of the array a contain the $\min(n,m)$-by-m upper trapezoidal matrix R (R is upper triangular if $n \geq m$); the elements below the diagonal, with the array $taua$, represent the orthogonal/unitary matrix Q as a product of $\min(n,m)$ elementary reflectors ;</p>
--------	--

if $n \leq p$, the upper triangle of the subarray $b(1:n, p-n+1:p)$ contains the n -by- n upper triangular matrix T ;
 if $n > p$, the elements on and above the $(n-p)$ th subdiagonal contain the n -by- p upper trapezoidal matrix T ; the remaining elements, with the array τ_{aub} , represent the orthogonal/unitary matrix Z as a product of elementary reflectors.

τ_{aua}, τ_{aub}

REAL for sggqrf
 DOUBLE PRECISION for dggqrf
 COMPLEX for cggqrf
 DOUBLE COMPLEX for zggqrf.

Arrays, size at least $\max(1, \min(n, m))$ for τ_{aua} and at least $\max(1, \min(n, p))$ for τ_{aub} . The array τ_{aua} contains the scalar factors of the elementary reflectors which represent the orthogonal/unitary matrix Q .
 The array τ_{aub} contains the scalar factors of the elementary reflectors which represent the orthogonal/unitary matrix Z .

$work(1)$

If $info = 0$, on exit $work(1)$ contains the minimum value of $lwork$ required for optimum performance. Use this $lwork$ for subsequent runs.

$info$

INTEGER.
 If $info = 0$, the execution is successful.
 If $info = -i$, the i -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `ggqrf` interface are the following:

a	Holds the matrix A of size (n, m) .
b	Holds the matrix B of size (n, p) .
τ_{aua}	Holds the vector of length $\min(n, m)$.
τ_{aub}	Holds the vector of length $\min(n, p)$.

Application Notes

The matrix Q is represented as a product of elementary reflectors

$Q = H(1)H(2) \dots H(k)$, where $k = \min(n, m)$.

Each $H(i)$ has the form

$H(i) = I - \tau_a^* v^* v^T$ for real flavors, or

$H(i) = I - \tau_a^* v^* v^H$ for complex flavors,

where τ_a is a real/complex scalar, and v is a real/complex vector with $v_j = 0$ for $1 \leq j \leq i - 1$, $v_i = 1$.

On exit, for $i + 1 \leq j \leq n$, v_j is stored in $a(i+1:n, i)$ and τ_a is stored in $\tau_{aua}(i)$

The matrix Z is represented as a product of elementary reflectors

$Z = H(1)H(2) \dots H(k)$, where $k = \min(n, p)$.

Each $H(i)$ has the form

$H(i) = I - \tau_b^* v^* v^T$ for real flavors, or

$H(i) = I - \tau_b^* v^* v^H$ for complex flavors,

where τ_b is a real/complex scalar, and v is a real/complex vector with $v_{p-k+1} = 1$, $v_j = 0$ for $p-k+1 \leq j \leq p-1$.

On exit, for $1 \leq j \leq p-k+i-1$, v_j is stored in $b(n-k+i, 1:p-k+i-1)$ and τ_b is stored in $\text{taub}(i)$.

For better performance, try using $\text{lwork} \geq \max(n, m, p) * \max(\text{nb1}, \text{nb2}, \text{nb3})$, where nb1 is the optimal blocksize for the QR factorization of an n -by- m matrix, nb2 is the optimal blocksize for the RQ factorization of an n -by- p matrix, and nb3 is the optimal blocksize for a call of [ormqr/unmqr](#).

If you are in doubt how much workspace to supply, use a generous value of lwork for the first run or set $\text{lwork} = -1$.

If you choose the first option and set any of admissible lwork sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array work on exit. Use this value ($\text{work}(1)$) for subsequent runs.

If you set $\text{lwork} = -1$, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (work). This operation is called a workspace query.

Note that if you set lwork to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

[?ggrqf](#)

Computes the generalized RQ factorization of two matrices.

Syntax

```
call sggrqf (m, p, n, a, lda, taua, b, ldb, taub, work, lwork, info)
call dggrqf (m, p, n, a, lda, taua, b, ldb, taub, work, lwork, info)
call cggrqf (m, p, n, a, lda, taua, b, ldb, taub, work, lwork, info)
call zggrqf (m, p, n, a, lda, taua, b, ldb, taub, work, lwork, info)
call ggrqf(a, b [,taua] [,taub] [,info])
```

Include Files

- `mkl.fi`, `lapack.f90`

Description

The routine forms the generalized RQ factorization of an m -by- n matrix A and an p -by- n matrix B as $A = R^*Q$, $B = Z^*T^*Q$, where Q is an n -by- n orthogonal/unitary matrix, Z is a p -by- p orthogonal/unitary matrix, and R and T assume one of the forms:

$$R = \begin{matrix} n-m & m \\ m & \begin{pmatrix} 0 & R_{12} \end{pmatrix} \end{matrix}, \quad \text{if } m \leq n,$$

or

$$R = \begin{matrix} & n \\ m - n & \\ & n \end{matrix} \begin{pmatrix} R_{11} \\ R_{21} \end{pmatrix}, \quad \text{if } m > n,$$

where R_{11} or R_{21} is upper triangular, and

$$T = \begin{matrix} & n \\ n & \\ p - n & \end{matrix} \begin{pmatrix} T_{11} \\ 0 \end{pmatrix}, \quad \text{if } p \geq n,$$

or

$$T = \begin{matrix} p & n - p \\ p & \end{matrix} \begin{pmatrix} T_{11} & T_{12} \end{pmatrix}, \quad \text{if } p < n,$$

where T_{11} is upper triangular.

In particular, if B is square and nonsingular, the GRQ factorization of A and B implicitly gives the RQ factorization of $A*B^{-1}$ as:

$$A*B^{-1} = (R*T^{-1}) * Z^T \text{ (for real flavors) or } A*B^{-1} = (R*T^{-1}) * Z^H \text{ (for complex flavors).}$$

Input Parameters

m	INTEGER. The number of rows of the matrix A ($m \geq 0$).
p	INTEGER. The number of rows in B ($p \geq 0$).
n	INTEGER. The number of columns of the matrices A and B ($n \geq 0$).
$a, b, work$	<p>REAL for sggrqf</p> <p>DOUBLE PRECISION for dggrqf</p> <p>COMPLEX for cggrqf</p> <p>DOUBLE COMPLEX for zggrqf.</p> <p>Arrays:</p> <p>$a(lda,*)$ contains the m-by-n matrix A. The second dimension of a must be at least $\max(1, n)$.</p> <p>$b(lb,*)$ contains the p-by-n matrix B. <i>work</i> (1)	If <i>info</i> = 0, on exit <i>work</i> (1) contains the minimum value of <i>lwork</i> required for optimum performance. Use this <i>lwork</i> for subsequent runs.
<i>info</i>	<p>INTEGER.</p> <p>If <i>info</i> = 0, the execution is successful.</p> <p>If <i>info</i> = -<i>i</i>, the <i>i</i>-th parameter had an illegal value.</p>

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine *ggrqf* interface are the following:

<i>a</i>	Holds the matrix <i>A</i> of size (m,n) .
<i>b</i>	Holds the matrix <i>A</i> of size (p,n) .
<i>taua</i>	Holds the vector of length $\min(m,n)$.
<i>taub</i>	Holds the vector of length $\min(p,n)$.

Application Notes

The matrix *Q* is represented as a product of elementary reflectors

$Q = H(1)H(2) \dots H(k)$, where $k = \min(m,n)$.

Each *H*(*i*) has the form

$H(i) = I - \text{taua} * v * v^T$ for real flavors, or

$H(i) = I - \text{taua} * v * v^H$ for complex flavors,

where *taua* is a real/complex scalar, and *v* is a real/complex vector with $v_{n-k+i} = 1$, $v_{n-k+i+1:n} = 0$.

On exit, $v_{1:n-k+i-1}$ is stored in $a(m-k+i, 1:n-k+i-1)$ and *taua* is stored in $\text{taua}(i)$.

The matrix *Z* is represented as a product of elementary reflectors

$Z = H(1)H(2) \dots H(k)$, where $k = \min(p,n)$.

Each *H*(*i*) has the form

$H(i) = I - \text{taub} * v * v^T$ for real flavors, or

$H(i) = I - \text{taub} * v * v^H$ for complex flavors,

where *taub* is a real/complex scalar, and *v* is a real/complex vector with $v_{1:i-1} = 0$, $v_i = 1$.

On exit, $v_{i+1:p}$ is stored in $b(i+1:p, i)$ and *taub* is stored in $\text{taub}(i)$.

For better performance, try using

$lwork \geq \max(n, m, p) * \max(nb1, nb2, nb3)$,

where *nb1* is the optimal blocksize for the *RQ* factorization of an *m*-by-*n* matrix, *nb2* is the optimal blocksize for the *QR* factorization of an *p*-by-*n* matrix, and *nb3* is the optimal blocksize for a call of ?ormrq/?unmrq.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork*= -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork*= -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?tpqrt

Computes a blocked QR factorization of a real or complex "triangular-pentagonal" matrix, which is composed of a triangular block and a pentagonal block, using the compact WY representation for Q.

Syntax

```
call stpqrt(m, n, l, nb, a, lda, b, ldb, t, ldt, work, info)
call dtpqrt(m, n, l, nb, a, lda, b, ldb, t, ldt, work, info)
call ctpqrt(m, n, l, nb, a, lda, b, ldb, t, ldt, work, info)
call ztpqrt(m, n, l, nb, a, lda, b, ldb, t, ldt, work, info)
call tpqrt(a, b, t, nb[, info])
```

Include Files

- mkl.fi, lapack.f90

Description

The input matrix C is an $(n+m)$ -by- n matrix

$$C = \begin{bmatrix} A \\ B \end{bmatrix} \begin{matrix} \leftarrow n \times n \text{ upper triangular} \\ \leftarrow m \times n \text{ pentagonal} \end{matrix}$$

where A is an n -by- n upper triangular matrix, and B is an m -by- n pentagonal matrix consisting of an $(m-l)$ -by- n rectangular matrix $B1$ on top of an l -by- n upper trapezoidal matrix $B2$:

$$B = \begin{bmatrix} B1 \\ B2 \end{bmatrix} \begin{matrix} \leftarrow (m-l) \times n \text{ rectangular} \\ \leftarrow l \times n \text{ upper trapezoidal} \end{matrix}$$

The upper trapezoidal matrix $B2$ consists of the first l rows of an n -by- n upper triangular matrix, where $0 \leq l \leq \min(m, n)$. If $l=0$, B is an m -by- n rectangular matrix. If $m=l=n$, B is upper triangular. The elementary reflectors $H(i)$ are stored in the i th column below the diagonal in the $(n+m)$ -by- n input matrix C . The structure of vectors defining the elementary reflectors is illustrated by:

$$\begin{bmatrix} I \\ V \end{bmatrix} \begin{matrix} \leftarrow n \times n \text{ identity} \\ \leftarrow m \times n \text{ pentagonal} \end{matrix}$$

The elements of the unit matrix I are not stored. Thus, V contains all of the necessary information, and is returned in array b .

NOTE

Note that V has the same form as B :

$$V = \begin{bmatrix} V1 \\ V2 \end{bmatrix} \begin{matrix} \leftarrow (m-l) \times n \text{ rectangular} \\ \leftarrow l \times n \text{ upper trapezoidal} \end{matrix}$$

The columns of V represent the vectors which define the $H(i)$ s.

The number of blocks is $k = \text{ceiling}(n/nb)$, where each block is of order nb except for the last block, which is of order $ib = n - (k-1)*nb$. For each of the k blocks, an upper triangular block reflector factor is computed: $T1, T2, \dots, Tk$. The nb -by- nb (ib -by- ib for the last block) T is are stored in the nb -by- n array t as

$t = [T1T2 \dots Tk]$.

Input Parameters

m	INTEGER. The total number of rows in the matrix B ($m \geq 0$).
n	INTEGER. The number of columns in B and the order of the triangular matrix A ($n \geq 0$).
l	INTEGER. The number of rows of the upper trapezoidal part of B ($\min(m, n) \geq l \geq 0$).
nb	INTEGER. The block size to use in the blocked QR factorization ($n \geq nb \geq 1$).
$a, b, work$	REAL for <code>stpqrt</code> DOUBLE PRECISION for <code>dtpqrt</code> COMPLEX for <code>ctpqrt</code> COMPLEX*16 for <code>ztpqrt</code> . Arrays: a size (lda, n) contains the n -by- n upper triangular matrix A . b size (ldb, n), the pentagonal m -by- n matrix B . The first $(m-1)$ rows contain the rectangular $B1$ matrix, and the next l rows contain the upper trapezoidal $B2$ matrix. $work$ size (nb, n) is a workspace array.
lda	INTEGER. The leading dimension of a ; at least $\max(1, n)$.
ldb	INTEGER. The leading dimension of b ; at least $\max(1, m)$.
ldt	INTEGER. The leading dimension of t ; at least nb .

Output Parameters

a	The elements on and above the diagonal of the array contain the upper triangular matrix R .
b	The pentagonal matrix V .
t	REAL for <code>stpqrt</code> DOUBLE PRECISION for <code>dtpqrt</code> COMPLEX for <code>ctpqrt</code> COMPLEX*16 for <code>ztpqrt</code> . Array, size (ldt, n). The upper triangular block reflectors stored in compact form as a sequence of upper triangular blocks.

info

INTEGER.

If *info* = 0, the execution is successful.If *info* < 0 and *info* = -*i*, the *i*th argument had an illegal value.**?tpmqrt**

Applies a real or complex orthogonal matrix obtained from a "triangular-pentagonal" complex block reflector to a general real or complex matrix, which consists of two blocks.

Syntax

```
call stpmqrt(side, trans, m, n, k, l, nb, v, ldv, t, ldt, a, lda, b, ldb, work, info)
call dtpmqrt(side, trans, m, n, k, l, nb, v, ldv, t, ldt, a, lda, b, ldb, work, info)
call ctpmqrt(side, trans, m, n, k, l, nb, v, ldv, t, ldt, a, lda, b, ldb, work, info)
call ztpmqrt(side, trans, m, n, k, l, nb, v, ldv, t, ldt, a, lda, b, ldb, work, info)
call tpmqrt( v, t, a, b, k, nb[, trans][, side][, info])
```

Include Files

- mkl.fi, lapack.f90

Description

The columns of the pentagonal matrix V contain the elementary reflectors $H(1), H(2), \dots, H(k)$; V is composed of a rectangular block $V1$ and a trapezoidal block $V2$:

$$V = \begin{bmatrix} V1 \\ V2 \end{bmatrix}$$

The size of the trapezoidal block $V2$ is determined by the parameter l , where $0 \leq l \leq k$. $V2$ is upper trapezoidal, consisting of the first l rows of a k -by- k upper triangular matrix.

If $l=k$, $V2$ is upper triangular;

If $l=0$, there is no trapezoidal block, so $V = V1$ is rectangular.

If *side* = 'L':

$$C = \begin{bmatrix} A \\ B \end{bmatrix}$$

where A is k -by- n , B is m -by- n and V is m -by- k .

If *side* = 'R':

$$C = \begin{bmatrix} A & B \end{bmatrix}$$

where A is m -by- k , B is m -by- n and V is n -by- k .

The real/complex orthogonal matrix Q is formed from V and T .

If $trans='N'$ and $side='L'$, C contains $Q * C$ on exit.

If $trans='T'$ and $side='L'$, C contains $Q^T * C$ on exit.

If $trans='C'$ and $side='L'$, C contains $Q^H * C$ on exit.

If $trans='N'$ and $side='R'$, C contains $C * Q$ on exit.

If $trans='T'$ and $side='R'$, C contains $C * Q^T$ on exit.

If $trans='C'$ and $side='R'$, C contains $C * Q^H$ on exit.

Input Parameters

<i>side</i>	<p>CHARACTER*1</p> <p>= 'L': apply Q, Q^T, or Q^H from the left.</p> <p>= 'R': apply Q, Q^T, or Q^H from the right.</p>
<i>trans</i>	<p>CHARACTER*1</p> <p>= 'N', no transpose, apply Q.</p> <p>= 'T', transpose, apply Q^T.</p> <p>= 'C', transpose, apply Q^H.</p>
<i>m</i>	INTEGER. The number of rows in the matrix B , ($m \geq 0$).
<i>n</i>	INTEGER. The number of columns in the matrix B , ($n \geq 0$).
<i>k</i>	INTEGER. The number of elementary reflectors whose product defines the matrix Q , ($k \geq 0$).
<i>l</i>	INTEGER. The order of the trapezoidal part of V ($k \geq l \geq 0$).
<i>nb</i>	<p>INTEGER.</p> <p>The block size used for the storage of t, $k \geq nb \geq 1$. This must be the same value of nb used to generate t in <code>tpqrt</code>.</p>
<i>v</i>	<p>REAL for <code>stpmqrt</code></p> <p>DOUBLE PRECISION for <code>dtpmqrt</code></p> <p>COMPLEX for <code>ctpmqrt</code></p> <p>COMPLEX*16 for <code>ztpmqrt</code>.</p> <p>Size (ldv, k)</p> <p>The ith column must contain the vector which defines the elementary reflector $H(i)$, for $i = 1, 2, \dots, k$, as returned by <code>tpqrt</code> in array argument b.</p>
<i>ldv</i>	<p>INTEGER. The leading dimension of the array v.</p> <p>If $side = 'L'$, ldv must be at least $\max(1, m)$;</p> <p>If $side = 'R'$, ldv must be at least $\max(1, n)$.</p>
<i>t</i>	REAL for <code>stpmqrt</code>

DOUBLE PRECISION for dtpmqrt

COMPLEX for ctpmqrt

COMPLEX*16 for ztpmqrt.

Array, size (ldt , k).

The upper triangular factors of the block reflectors as returned by [tpqrt](#), stored as an nb -by- k matrix.

ldt INTEGER. The leading dimension of the array *t*. *ldt* must be at least nb .

a REAL for stpmqrt
DOUBLE PRECISION for dtpmqrt
COMPLEX for ctpmqrt
COMPLEX*16 for ztpmqrt.
If *side* = 'L', size (lda , n).
If *side* = 'R', size (lda , k).
The k -by- n or m -by- k matrix *A*.

lda INTEGER. The leading dimension of the array *a*.
If *side* = 'L', *lda* must be at least $\max(1, k)$.
If *side* = 'R', *lda* must be at least $\max(1, m)$.

b REAL for stpmqrt
DOUBLE PRECISION for dtpmqrt
COMPLEX for ctpmqrt
COMPLEX*16 for ztpmqrt.
Size (ldb , n).
The m -by- n matrix *B*.

ldb INTEGER. The leading dimension of the array *b*. *ldb* must be at least $\max(1, m)$.

work REAL for stpmqrt
DOUBLE PRECISION for dtpmqrt
COMPLEX for ctpmqrt
COMPLEX*16 for ztpmqrt.
Workspace array. If *side* = 'L' DIMENSION $n*nb$. If *side* = 'R' DIMENSION $m*nb$.

Output Parameters

a Overwritten by the corresponding block of the product Q^*C , C^*Q , $Q^T C$, $C^* Q^T$, $Q^H C$, or $C^* Q^H$.

<i>b</i>	Overwritten by the corresponding block of the product Q^*C , C^*Q , Q^T^*C , C^*Q^T , Q^H^*C , or C^*Q^H .
<i>info</i>	(global) INTEGER. = 0: the execution is successful. < 0: if <i>info</i> = - <i>i</i> , the <i>i</i> th argument had an illegal value.

Singular Value Decomposition - LAPACK Computational Routines

This section describes LAPACK routines for computing the *singular value decomposition* (SVD) of a general m -by- n matrix A :

$$A = U\Sigma V^H.$$

In this decomposition, U and V are unitary (for complex A) or orthogonal (for real A); Σ is an m -by- n diagonal matrix with real diagonal elements σ_i :

$$\sigma_1 \geq \sigma_2 \geq \dots \geq \sigma_{\min(m, n)} \geq 0.$$

The diagonal elements σ_i are *singular values* of A . The first $\min(m, n)$ columns of the matrices U and V are, respectively, *left* and *right singular vectors* of A . The singular values and singular vectors satisfy

$$Av_i = \sigma_i u_i \text{ and } A^H u_i = \sigma_i v_i$$

where u_i and v_i are the i -th columns of U and V , respectively.

To find the SVD of a general matrix A , call the LAPACK routine ?gebrd or ?gbbbrd for reducing A to a bidiagonal matrix B by a unitary (orthogonal) transformation: $A = QBP^H$. Then call ?bdsqr, which forms the SVD of a bidiagonal matrix: $B = U_1 \Sigma V_1^H$.

Thus, the sought-for SVD of A is given by $A = U\Sigma V^H = (QU_1)\Sigma(V_1^H P^H)$.

Table "Computational Routines for Singular Value Decomposition (SVD)" lists LAPACK routines (FORTRAN 77 interface) that perform singular value decomposition of matrices. The corresponding routine names in the Fortran 95 interface are the same except that the first character is removed.

Computational Routines for Singular Value Decomposition (SVD)

Apply the orthogonal (unitary) matrix Q or P	?ormbr	?unmbr
Form singular value decomposition of the bidiagonal matrix B : $B = U_1 \Sigma V_1^H$?bdsqr ?bdsdc	?bdsqr

Decision Tree: Singular Value Decomposition

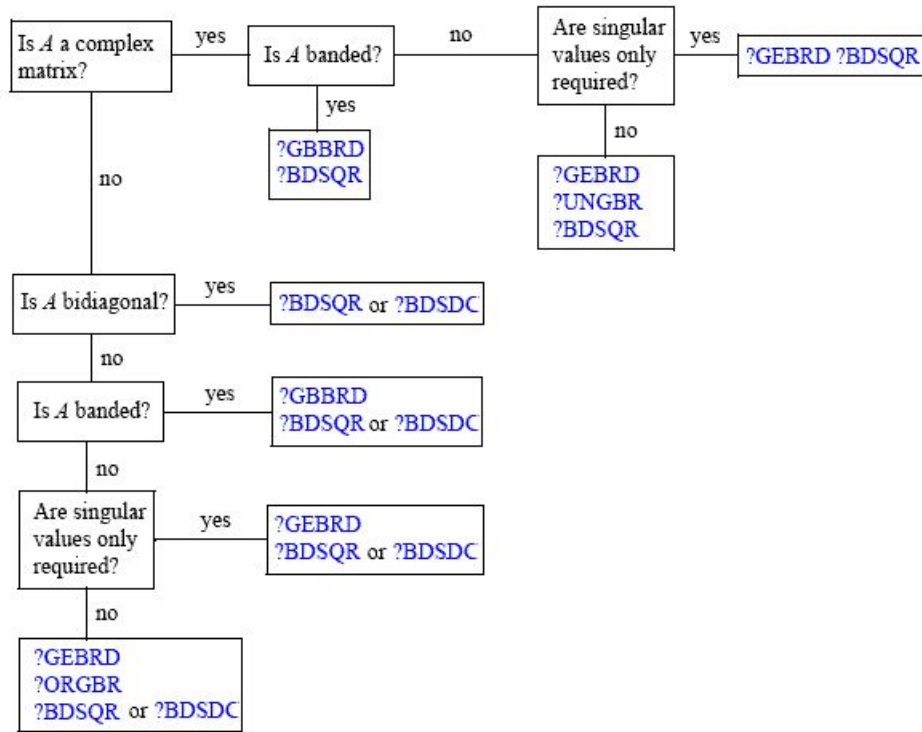

Figure "Decision Tree: Singular Value Decomposition" presents a decision tree that helps you choose the right sequence of routines for SVD, depending on whether you need singular values only or singular vectors as well, whether A is real or complex, and so on.

You can use the SVD to find a minimum-norm solution to a (possibly) rank-deficient least squares problem of minimizing $\|Ax - b\|^2$. The effective rank k of the matrix A can be determined as the number of singular values which exceed a suitable threshold. The minimum-norm solution is

$$x = V_k (\Sigma_k)^{-1} c$$

where Σ_k is the leading k -by- k submatrix of Σ , the matrix V_k consists of the first k columns of $V = PV_1$, and the vector c consists of the first k elements of $U^H b = U_1^H Q^H b$.

?gebrd

Reduces a general matrix to bidiagonal form.

Syntax

```

call sgebrd(m, n, a, lda, d, e, tauq, taup, work, lwork, info)
call dgebrd(m, n, a, lda, d, e, tauq, taup, work, lwork, info)
call cgebrd(m, n, a, lda, d, e, tauq, taup, work, lwork, info)
call zgebrd(m, n, a, lda, d, e, tauq, taup, work, lwork, info)
call gebrd(a [, d] [, e] [, tauq] [, taup] [, info])

```

Include Files

- mkl.fi, lapack.f90

Description

The routine reduces a general m -by- n matrix A to a bidiagonal matrix B by an orthogonal (unitary) transformation.

$$A = QB P^H = Q \begin{pmatrix} B_1 \\ 0 \end{pmatrix} P^H = Q_1 B_1 P^H,$$

If $m \geq n$, the reduction is given by

where B_1 is an n -by- n upper diagonal matrix, Q and P are orthogonal or, for a complex A , unitary matrices; Q_1 consists of the first n columns of Q .

If $m < n$, the reduction is given by

$$A = Q^* B^* P^H = Q^* (B_1 0) P^H = Q_1^* B_1^* P_1^H,$$

where B_1 is an m -by- m lower diagonal matrix, Q and P are orthogonal or, for a complex A , unitary matrices; P_1 consists of the first m columns of P .

The routine does not form the matrices Q and P explicitly, but represents them as products of elementary reflectors. Routines are provided to work with the matrices Q and P in this representation:

If the matrix A is real,

- to compute Q and P explicitly, call [orgbr](#).
- to multiply a general matrix by Q or P , call [ormbr](#).

If the matrix A is complex,

- to compute Q and P explicitly, call [ungbr](#).
- to multiply a general matrix by Q or P , call [unmbr](#).

Input Parameters

m INTEGER. The number of rows in the matrix A ($m \geq 0$).

n INTEGER. The number of columns in A ($n \geq 0$).

$a, work$ REAL for [sgebrd](#)
DOUBLE PRECISION for [dgebrd](#)
COMPLEX for [cgebrd](#)
DOUBLE COMPLEX for [zgebrd](#).

Arrays:

$a(lda,*)$ contains the matrix A .

The second dimension of a must be at least $\max(1, n)$.

$work$ is a workspace array, its dimension $\max(1, lwork)$.

lda INTEGER. The leading dimension of a ; at least $\max(1, m)$.

$lwork$ INTEGER.

The dimension of $work$; at least $\max(1, m, n)$.

If $lwork = -1$, then a workspace query is assumed; the routine only calculates the optimal size of the $work$ array, returns this value as the first entry of the $work$ array, and no error message related to $lwork$ is issued by [xerbla](#).

See *Application Notes* for the suggested value of *lwork*.

Output Parameters

<i>a</i>	<p>If $m \geq n$, the diagonal and first super-diagonal of <i>a</i> are overwritten by the upper bidiagonal matrix <i>B</i>. The elements below the diagonal, with the array <i>tauq</i>, represent the orthogonal matrix <i>Q</i> as a product of elementary reflectors, and the elements above the first superdiagonal, with the array <i>taup</i>, represent the orthogonal matrix <i>P</i> as a product of elementary reflectors.</p> <p>If $m < n$, the diagonal and first sub-diagonal of <i>a</i> are overwritten by the lower bidiagonal matrix <i>B</i>. The elements below the first subdiagonal, with the array <i>tauq</i>, represent the orthogonal matrix <i>Q</i> as a product of elementary reflectors, and the elements above the diagonal, with the array <i>taup</i>, represent the orthogonal matrix <i>P</i> as a product of elementary reflectors.</p>
<i>d</i>	<p>REAL for single-precision flavors</p> <p>DOUBLE PRECISION for double-precision flavors.</p> <p>Array, size at least $\max(1, \min(m, n))$.</p> <p>Contains the diagonal elements of <i>B</i>.</p>
<i>e</i>	<p>REAL for single-precision flavors</p> <p>DOUBLE PRECISION for double-precision flavors.</p> <p>Array, size at least $\max(1, \min(m, n) - 1)$. Contains the off-diagonal elements of <i>B</i>.</p>
<i>tauq</i> , <i>taup</i>	<p>REAL for sgebrd</p> <p>DOUBLE PRECISION for dgebrd</p> <p>COMPLEX for cgebrd</p> <p>DOUBLE COMPLEX for zgebrd.</p> <p>Arrays, size at least $\max(1, \min(m, n))$. The scalar factors of the elementary reflectors which represent the orthogonal or unitary matrices <i>P</i> and <i>Q</i>.</p>
<i>work</i> (1)	<p>If <i>info</i> = 0, on exit <i>work</i>(1) contains the minimum value of <i>lwork</i> required for optimum performance. Use this <i>lwork</i> for subsequent runs.</p>
<i>info</i>	<p>INTEGER.</p> <p>If <i>info</i> = 0, the execution is successful.</p> <p>If <i>info</i> = -<i>i</i>, the <i>i</i>-th parameter had an illegal value.</p>

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `gebrd` interface are the following:

<i>a</i>	Holds the matrix <i>A</i> of size (m,n) .
<i>d</i>	Holds the vector of length $\min(m,n)$.
<i>e</i>	Holds the vector of length $\min(m,n)-1$.
<i>tauq</i>	Holds the vector of length $\min(m,n)$.
<i>taup</i>	Holds the vector of length $\min(m,n)$.

Application Notes

For better performance, try using $lwork = (m + n) * blocksize$, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set $lwork = -1$.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set $lwork = -1$, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed matrices *Q*, *B*, and *P* satisfy $QBP^H = A + E$, where $\|E\|_2 = c(n)\varepsilon \|A\|_2$, $c(n)$ is a modestly increasing function of *n*, and ε is the machine precision.

The approximate number of floating-point operations for real flavors is

$$(4/3) * n^2 * (3 * m - n) \text{ for } m \geq n,$$

$$(4/3) * m^2 * (3 * n - m) \text{ for } m < n.$$

The number of operations for complex flavors is four times greater.

If *n* is much less than *m*, it can be more efficient to first form the QR factorization of *A* by calling [geqrf](#) and then reduce the factor *R* to bidiagonal form. This requires approximately $2 * n^2 * (m + n)$ floating-point operations.

If *m* is much less than *n*, it can be more efficient to first form the LQ factorization of *A* by calling [gelqf](#) and then reduce the factor *L* to bidiagonal form. This requires approximately $2 * m^2 * (m + n)$ floating-point operations.

?gbbbrd

Reduces a general band matrix to bidiagonal form.

Syntax

```
call sgbbbrd(vect, m, n, ncc, kl, ku, ab, ldab, d, e, q, ldq, pt, ldpt, c, ldc, work,
info)

call dgbbbrd(vect, m, n, ncc, kl, ku, ab, ldab, d, e, q, ldq, pt, ldpt, c, ldc, work,
info)

call cgbbbrd(vect, m, n, ncc, kl, ku, ab, ldab, d, e, q, ldq, pt, ldpt, c, ldc, work,
rwork, info)

call zgbbbrd(vect, m, n, ncc, kl, ku, ab, ldab, d, e, q, ldq, pt, ldpt, c, ldc, work,
rwork, info)
```

```
call gbbbrd(ab [, c] [, d] [, e] [, q] [, pt] [, kl] [, m] [, info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine reduces an m -by- n band matrix A to upper bidiagonal matrix B : $A = Q*B*P^H$. Here the matrices Q and P are orthogonal (for real A) or unitary (for complex A). They are determined as products of Givens rotation matrices, and may be formed explicitly by the routine if required. The routine can also update a matrix C as follows: $C = Q^H*C$.

Input Parameters

<i>vect</i>	<p>CHARACTER*1. Must be 'N' or 'Q' or 'P' or 'B'.</p> <p>If <i>vect</i> = 'N', neither Q nor P^H is generated.</p> <p>If <i>vect</i> = 'Q', the routine generates the matrix Q.</p> <p>If <i>vect</i> = 'P', the routine generates the matrix P^H.</p> <p>If <i>vect</i> = 'B', the routine generates both Q and P^H.</p>
<i>m</i>	INTEGER. The number of rows in the matrix A ($m \geq 0$).
<i>n</i>	INTEGER. The number of columns in A ($n \geq 0$).
<i>ncc</i>	INTEGER. The number of columns in C ($ncc \geq 0$).
<i>kl</i>	INTEGER. The number of sub-diagonals within the band of A ($kl \geq 0$).
<i>ku</i>	INTEGER. The number of super-diagonals within the band of A ($ku \geq 0$).
<i>ab, c, work</i>	<p>REAL for sgbbrd</p> <p>DOUBLE PRECISION for dgbbrd</p> <p>COMPLEX for cgbbrd</p> <p>DOUBLE COMPLEX for zgbbrd.</p> <p>Arrays:</p> <p><i>ab</i>(<i>ldab</i>,*) contains the matrix A in band storage (see Matrix Storage Schemes).</p> <p>The second dimension of <i>a</i> must be at least $\max(1, n)$.</p> <p><i>c</i>(<i>ldc</i>,*) contains an m-by-ncc matrix C.</p> <p>If $ncc = 0$, the array <i>c</i> is not referenced.</p> <p>The second dimension of <i>c</i> must be at least $\max(1, ncc)$.</p> <p><i>work</i>(*) is a workspace array.</p> <p>The dimension of <i>work</i> must be at least $2*\max(m, n)$ for real flavors, or $\max(m, n)$ for complex flavors.</p>
<i>ldab</i>	INTEGER. The leading dimension of the array <i>ab</i> ($ldab \geq kl + ku + 1$).
<i>ldq</i>	INTEGER. The leading dimension of the output array <i>q</i> .

$ldq \geq \max(1, m)$ if *vect* = 'Q' or 'B', $ldq \geq 1$ otherwise.

ldpt

INTEGER. The leading dimension of the output array *pt*.

$ldpt \geq \max(1, n)$ if *vect* = 'P' or 'B', $ldpt \geq 1$ otherwise.

ldc

INTEGER. The leading dimension of the array *c*.

$ldc \geq \max(1, m)$ if *ncc* > 0; $ldc \geq 1$ if *ncc* = 0.

rwork

REAL for *cgbbrd* DOUBLE PRECISION for *zgbbrd*.

A workspace array, size at least $\max(m, n)$.

Output Parameters

ab

Overwritten by values generated during the reduction.

d

REAL for single-precision flavors

DOUBLE PRECISION for double-precision flavors.

Array, size at least $\max(1, \min(m, n))$. Contains the diagonal elements of the matrix *B*.

e

REAL for single-precision flavors

DOUBLE PRECISION for double-precision flavors.

Array, size at least $\max(1, \min(m, n) - 1)$.

Contains the off-diagonal elements of *B*.

q, pt

REAL for *sgebrd*

DOUBLE PRECISION for *dgebrd*

COMPLEX for *cgebrd*

DOUBLE COMPLEX for *zgebrd*.

Arrays:

q(*ldq*, *) contains the output *m*-by-*m* matrix *Q*.

The second dimension of *q* must be at least $\max(1, m)$.

p(*ldpt*, *) contains the output *n*-by-*n* matrix *P*^T.

The second dimension of *pt* must be at least $\max(1, n)$.

c

Overwritten by the product $Q^{H*}C$.

c is not referenced if *ncc* = 0.

info

INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `gbbbrd` interface are the following:

<i>ab</i>	Holds the array <i>A</i> of size $(kl+ku+1,n)$.
<i>c</i>	Holds the matrix <i>C</i> of size (m,ncc) .
<i>d</i>	Holds the vector with the number of elements $\min(m,n)$.
<i>e</i>	Holds the vector with the number of elements $\min(m,n)-1$.
<i>q</i>	Holds the matrix <i>Q</i> of size (m,m) .
<i>pt</i>	Holds the matrix <i>PT</i> of size (n,n) .
<i>m</i>	If omitted, assumed $m = n$.
<i>kl</i>	If omitted, assumed $kl = ku$.
<i>ku</i>	Restored as $ku = lda-kl-1$.
<i>vect</i>	Restored based on the presence of arguments <i>q</i> and <i>pt</i> as follows: $vect = 'B'$, if both <i>q</i> and <i>pt</i> are present, $vect = 'Q'$, if <i>q</i> is present and <i>pt</i> omitted, $vect = 'P'$, if <i>q</i> is omitted and <i>pt</i> present, $vect = 'N'$, if both <i>q</i> and <i>pt</i> are omitted.

Application Notes

The computed matrices *Q*, *B*, and *P* satisfy $Q^*B^*P^H = A + E$, where $\|E\|_2 = c(n)\varepsilon \|A\|_2$, $c(n)$ is a modestly increasing function of n , and ε is the machine precision.

If $m = n$, the total number of floating-point operations for real flavors is approximately the sum of:

$6*n^2*(kl + ku)$ if $vect = 'N'$ and $ncc = 0$,

$3*n^2*ncc*(kl + ku - 1)/(kl + ku)$ if *C* is updated, and

$3*n^3*(kl + ku - 1)/(kl + ku)$ if either *Q* or P^H is generated (double this if both).

To estimate the number of operations for complex flavors, use the same formulas with the coefficients 20 and 10 (instead of 6 and 3).

?orgbr

*Generates the real orthogonal matrix *Q* or *P^T* determined by ?gebrd.*

Syntax

```
call sorgbr(vect, m, n, k, a, lda, tau, work, lwork, info)
call dorgbr(vect, m, n, k, a, lda, tau, work, lwork, info)
call orgbr(a, tau [,vect] [,info])
```

Include Files

- `mkl.fi`, `lapack.f90`

Description

The routine generates the whole or part of the orthogonal matrices Q and P^T formed by the routines [gebrd](#)/[gebrd](#). Use this routine after a call to `sgebrd`/`dgebrd`. All valid combinations of arguments are described in *Input parameters*. In most cases you need the following:

To compute the whole m -by- m matrix Q :

```
call ?orgbr('Q', m, m, n, a ... )
```

(note that the array a must have at least m columns).

To form the n leading columns of Q if $m > n$:

```
call ?orgbr('Q', m, n, n, a ... )
```

To compute the whole n -by- n matrix P^T :

```
call ?orgbr('P', n, n, m, a ... )
```

(note that the array a must have at least n rows).

To form the m leading rows of P^T if $m < n$:

```
call ?orgbr('P', m, n, m, a ... )
```

Input Parameters

<i>vect</i>	<p>CHARACTER*1. Must be 'Q' or 'P'.</p> <p>If <i>vect</i> = 'Q', the routine generates the matrix Q.</p> <p>If <i>vect</i> = 'P', the routine generates the matrix P^T.</p>
<i>m</i> , <i>n</i>	<p>INTEGER. The number of rows (m) and columns (n) in the matrix Q or P^T to be returned ($m \geq 0$, $n \geq 0$).</p> <p>If <i>vect</i> = 'Q', $m \geq n \geq \min(m, k)$.</p> <p>If <i>vect</i> = 'P', $n \geq m \geq \min(n, k)$.</p>
<i>k</i>	<p>If <i>vect</i> = 'Q', the number of columns in the original m-by-k matrix reduced by gebrd.</p> <p>If <i>vect</i> = 'P', the number of rows in the original k-by-n matrix reduced by gebrd.</p>
<i>a</i>	<p>REAL for <code>sorgbr</code></p> <p>DOUBLE PRECISION for <code>dorgbr</code></p> <p>The vectors which define the elementary reflectors, as returned by gebrd.</p>
<i>lda</i>	<p>INTEGER. The leading dimension of the array <i>a</i>. $lda \geq \max(1, m)$.</p>
<i>tau</i>	<p>REAL for <code>sorgbr</code></p> <p>DOUBLE PRECISION for <code>dorgbr</code></p>

Array, size $\min(m, k)$ if $vect = 'Q'$, $\min(n, k)$ if $vect = 'P'$.
 Scalar factor of the elementary reflector $H(i)$ or $G(i)$, which determines Q and P^T as returned by [gebrd](#) in the array τ_{uq} or τ_{up} .

work REAL for `sorgbr`

DOUBLE PRECISION for `dorgbr`

Workspace array, size $\max(1, lwork)$.

lwork INTEGER. Dimension of the array *work*. See *Application Notes* for the suggested value of *lwork*.

If $lwork = -1$ then the routine performs a workspace query and calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by [xerbla](#).

Output Parameters

a Overwritten by the orthogonal matrix Q or P^T (or the leading rows or columns thereof) as specified by *vect*, m , and n .

work(1) If $info = 0$, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

info INTEGER.

If $info = 0$, the execution is successful.

If $info = -i$, the i -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `orgbr` interface are the following:

a Holds the matrix A of size (m, n) .

tau Holds the vector of length $\min(m, k)$ where

$k = m$, if $vect = 'P'$,

$k = n$, if $vect = 'Q'$.

vect Must be 'Q' or 'P'. The default value is 'Q'.

Application Notes

For better performance, try using $lwork = \min(m, n) * blocksize$, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the blocked algorithm.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set $lwork = -1$.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set `lwork = -1`, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (`work`). This operation is called a workspace query.

Note that if you set `lwork` to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed matrix Q differs from an exactly orthogonal matrix by a matrix E such that $\|E\|_2 = O(\epsilon)$.

The approximate numbers of floating-point operations for the cases listed in *Description* are as follows:

To form the whole of Q :

$(4/3) * n * (3m^2 - 3m * n + n^2)$ if $m > n$;

$(4/3) * m^3$ if $m \leq n$.

To form the n leading columns of Q when $m > n$:

$(2/3) * n^2 * (3m - n^2)$ if $m > n$.

To form the whole of P^T :

$(4/3) * n^3$ if $m \geq n$;

$(4/3) * m * (3n^2 - 3m * n + m^2)$ if $m < n$.

To form the m leading columns of P^T when $m < n$:

$(2/3) * n^2 * (3m - n^2)$ if $m > n$.

The complex counterpart of this routine is [ungbr](#).

?ormbr

Multiplies an arbitrary real matrix by the real orthogonal matrix Q or P^T determined by ?gebrd.

Syntax

```
call sormbr(vect, side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call dormbr(vect, side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call ormbr(a, tau, c [,vect] [,side] [,trans] [,info])
```

Include Files

- `mkl.fi`, `lapack.f90`

Description

Given an arbitrary real matrix C , this routine forms one of the matrix products $Q * C$, $Q^T * C$, $C * Q$, $C * Q^T$, $P * C$, $P^T * C$, $C * P$, $C * P^T$, where Q and P are orthogonal matrices computed by a call to [gebrd](#). The routine overwrites the product on C .

Input Parameters

In the descriptions below, r denotes the order of Q or P^T :

If `side = 'L'`, $r = m$; if `side = 'R'`, $r = n$.

<code>vect</code>	CHARACTER*1. Must be 'Q' or 'P'.
	If <code>vect = 'Q'</code> , then Q or Q^T is applied to C .
	If <code>vect = 'P'</code> , then P or P^T is applied to C .
<code>side</code>	CHARACTER*1. Must be 'L' or 'R'.

	<p>If <i>side</i> = 'L', multipliers are applied to <i>C</i> from the left.</p> <p>If <i>side</i> = 'R', they are applied to <i>C</i> from the right.</p>
<i>trans</i>	<p>CHARACTER*1. Must be 'N' or 'T'.</p> <p>If <i>trans</i> = 'N', then <i>Q</i> or <i>P</i> is applied to <i>C</i>.</p> <p>If <i>trans</i> = 'T', then Q^T or P^T is applied to <i>C</i>.</p>
<i>m</i>	INTEGER. The number of rows in <i>C</i> .
<i>n</i>	INTEGER. The number of columns in <i>C</i> .
<i>k</i>	<p>INTEGER. One of the dimensions of <i>A</i> in ?gebrd:</p> <p>If <i>vect</i> = 'Q', the number of columns in <i>A</i>;</p> <p>If <i>vect</i> = 'P', the number of rows in <i>A</i>.</p> <p>Constraints: $m \geq 0$, $n \geq 0$, $k \geq 0$.</p>
<i>a</i> , <i>c</i> , <i>work</i>	<p>REAL for sormbr</p> <p>DOUBLE PRECISION for dormbr.</p> <p>Arrays:</p> <p><i>a</i>(<i>lda</i>,*) is the array <i>a</i> as returned by ?gebrd.</p> <p>Its second dimension must be at least $\max(1, \min(r, k))$ for <i>vect</i> = 'Q', or $\max(1, r)$ for <i>vect</i> = 'P'.</p> <p><i>c</i>(<i>ldc</i>,*) holds the matrix <i>C</i>.</p> <p>Its second dimension must be at least $\max(1, n)$.</p> <p><i>work</i> is a workspace array, its dimension $\max(1, lwork)$.</p>
<i>lda</i>	<p>INTEGER. The leading dimension of <i>a</i>. Constraints:</p> <p>$lda \geq \max(1, r)$ if <i>vect</i> = 'Q';</p> <p>$lda \geq \max(1, \min(r, k))$ if <i>vect</i> = 'P'.</p>
<i>ldc</i>	INTEGER. The leading dimension of <i>c</i> ; $ldc \geq \max(1, m)$.
<i>tau</i>	<p>REAL for sormbr</p> <p>DOUBLE PRECISION for dormbr.</p> <p>Array, size at least $\max(1, \min(r, k))$.</p> <p>For <i>vect</i> = 'Q', the array <i>tauq</i> as returned by ?gebrd. For <i>vect</i> = 'P', the array <i>taup</i> as returned by ?gebrd.</p>
<i>lwork</i>	<p>INTEGER. The size of the <i>work</i> array. Constraints:</p> <p>$lwork \geq \max(1, n)$ if <i>side</i> = 'L';</p> <p>$lwork \geq \max(1, m)$ if <i>side</i> = 'R'.</p> <p>If <i>lwork</i> = -1, then a workspace query is assumed; the routine only calculates the optimal size of the <i>work</i> array, returns this value as the first entry of the <i>work</i> array, and no error message related to <i>lwork</i> is issued by xerbla.</p>

See *Application Notes* for the suggested value of *lwork*.

Output Parameters

<i>c</i>	Overwritten by the product Q^*C , $Q^{T*}C$, C^*Q , C^*Q^T , P^*C , $P^{T*}C$, C^*P , or C^*P^T , as specified by <i>vect</i> , <i>side</i> , and <i>trans</i> .
<i>work</i> (1)	If <i>info</i> = 0, on exit <i>work</i> (1) contains the minimum value of <i>lwork</i> required for optimum performance. Use this <i>lwork</i> for subsequent runs.
<i>info</i>	INTEGER. If <i>info</i> = 0, the execution is successful. If <i>info</i> = - <i>i</i> , the <i>i</i> -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `ormbr` interface are the following:

<i>a</i>	Holds the matrix <i>A</i> of size (<i>r</i> ,min(<i>nq</i> , <i>k</i>)) where $r = nq$, if <i>vect</i> = 'Q', $r = \min(nq, k)$, if <i>vect</i> = 'P', $nq = m$, if <i>side</i> = 'L', $nq = n$, if <i>side</i> = 'R', $k = m$, if <i>vect</i> = 'P', $k = n$, if <i>vect</i> = 'Q'.
<i>tau</i>	Holds the vector of length min(<i>nq</i> , <i>k</i>).
<i>c</i>	Holds the matrix <i>C</i> of size (<i>m</i> , <i>n</i>).
<i>vect</i>	Must be 'Q' or 'P'. The default value is 'Q'.
<i>side</i>	Must be 'L' or 'R'. The default value is 'L'.
<i>trans</i>	Must be 'N' or 'T'. The default value is 'N'.

Application Notes

For better performance, try using

lwork = *n***blocksize* for *side* = 'L', or

lwork = *m***blocksize* for *side* = 'R',

where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible $lwork$ sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array $work$ on exit. Use this value ($work(1)$) for subsequent runs.

If you set $lwork = -1$, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array ($work$). This operation is called a workspace query.

Note that if you set $lwork$ to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed product differs from the exact product by a matrix E such that $\|E\|_2 = O(\epsilon) * \|C\|_2$.

The total number of floating-point operations is approximately

$2*n*k(2*m - k)$ if $side = 'L'$ and $m \geq k$;

$2*m*k(2*n - k)$ if $side = 'R'$ and $n \geq k$;

$2*m^2*n$ if $side = 'L'$ and $m < k$;

$2*n^2*m$ if $side = 'R'$ and $n < k$.

The complex counterpart of this routine is [unmbr](#).

?ungbr

Generates the complex unitary matrix Q or P^H determined by ?gebrd.

Syntax

```
call cungbr(vect, m, n, k, a, lda, tau, work, lwork, info)
call zungbr(vect, m, n, k, a, lda, tau, work, lwork, info)
call ungbr(a, tau [,vect] [,info])
```

Include Files

- `mk1.fi`, `lapack.f90`

Description

The routine generates the whole or part of the unitary matrices Q and P^H formed by the routines [gebrd](#)/[gebrd](#). Use this routine after a call to [cgebrd](#)/[zgebrd](#). All valid combinations of arguments are described in *Input Parameters*; in most cases you need the following:

To compute the whole m -by- m matrix Q , use:

```
call ?ungbr('Q', m, m, n, a ... )
```

(note that the array a must have at least m columns).

To form the n leading columns of Q if $m > n$, use:

```
call ?ungbr('Q', m, n, n, a ... )
```

To compute the whole n -by- n matrix P^H , use:

```
call ?ungbr('P', n, n, m, a ... )
```

(note that the array a must have at least n rows).

To form the m leading rows of P^H if $m < n$, use:

```
call ?ungbr('P', m, n, m, a ... )
```

Input Parameters

<i>vect</i>	<p>CHARACTER*1. Must be 'Q' or 'P'.</p> <p>If <i>vect</i> = 'Q', the routine generates the matrix Q.</p> <p>If <i>vect</i> = 'P', the routine generates the matrix P^H.</p>
<i>m</i>	INTEGER. The number of required rows of Q or P^H .
<i>n</i>	INTEGER. The number of required columns of Q or P^H .
<i>k</i>	<p>INTEGER. One of the dimensions of A in ?gebrd:</p> <p>If <i>vect</i> = 'Q', the number of columns in A;</p> <p>If <i>vect</i> = 'P', the number of rows in A.</p> <p>Constraints: $m \geq 0, n \geq 0, k \geq 0$.</p> <p>For <i>vect</i> = 'Q': $k \leq n \leq m$ if $m > k$, or $m = n$ if $m \leq k$.</p> <p>For <i>vect</i> = 'P': $k \leq m \leq n$ if $n > k$, or $m = n$ if $n \leq k$.</p>
<i>a, work</i>	<p>COMPLEX for cunghbr</p> <p>DOUBLE COMPLEX for zungbr.</p> <p>Arrays:</p> <p><i>a(lda,*)</i> is the array <i>a</i> as returned by ?gebrd.</p> <p>The second dimension of <i>a</i> must be at least $\max(1, n)$.</p> <p><i>work</i> is a workspace array, its dimension $\max(1, lwork)$.</p>
<i>lda</i>	INTEGER. The leading dimension of <i>a</i> ; at least $\max(1, m)$.
<i>tau</i>	<p>COMPLEX for cunghbr</p> <p>DOUBLE COMPLEX for zungbr.</p> <p>For <i>vect</i> = 'Q', the array <i>tauq</i> as returned by ?gebrd. For <i>vect</i> = 'P', the array <i>taup</i> as returned by ?gebrd.</p> <p>The dimension of <i>tau</i> must be at least $\max(1, \min(m, k))$ for <i>vect</i> = 'Q', or $\max(1, \min(m, k))$ for <i>vect</i> = 'P'.</p>
<i>lwork</i>	<p>INTEGER. The size of the <i>work</i> array.</p> <p>Constraint: $lwork < \max(1, \min(m, n))$.</p> <p>If <i>lwork</i> = -1, then a workspace query is assumed; the routine only calculates the optimal size of the <i>work</i> array, returns this value as the first entry of the <i>work</i> array, and no error message related to <i>lwork</i> is issued by xerbla.</p> <p>See <i>Application Notes</i> for the suggested value of <i>lwork</i>.</p>

Output Parameters

<i>a</i>	Overwritten by the orthogonal matrix Q or P^T (or the leading rows or columns thereof) as specified by <i>vect</i> , <i>m</i> , and <i>n</i> .
----------	--

<code>work(1)</code>	If <code>info = 0</code> , on exit <code>work(1)</code> contains the minimum value of <code>lwork</code> required for optimum performance. Use this <code>lwork</code> for subsequent runs.
<code>info</code>	INTEGER. If <code>info = 0</code> , the execution is successful. If <code>info = -i</code> , the <i>i</i> -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `ungbr` interface are the following:

<code>a</code>	Holds the matrix A of size (m,n) .
<code>tau</code>	Holds the vector of length $\min(m,k)$ where $k = m$, if <code>vect = 'P'</code> , $k = n$, if <code>vect = 'Q'</code> .
<code>vect</code>	Must be 'Q' or 'P'. The default value is 'Q'.

Application Notes

For better performance, try using `lwork = min(m,n)*blocksize`, where `blocksize` is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If it is not clear how much workspace to supply, use a generous value of `lwork` for the first run, or set `lwork = -1`.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array `work` on exit. Use this value (`work(1)`) for subsequent runs.

If `lwork = -1`, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (`work`). This operation is called a workspace query.

Note that if `lwork` is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed matrix Q differs from an exactly orthogonal matrix by a matrix E such that $\|E\|_2 = O(\epsilon)$.

The approximate numbers of possible floating-point operations are listed below:

To compute the whole matrix Q :

$$(16/3)n(3m^2 - 3m*n + n^2) \text{ if } m > n;$$

$$(16/3)m^3 \text{ if } m \leq n.$$

To form the n leading columns of Q when $m > n$:

$$(8/3)n^2(3m - n^2).$$

To compute the whole matrix P^H :

$$(16/3)n^3 \text{ if } m \geq n;$$

$$(16/3)m(3n^2 - 3m*n + m^2) \text{ if } m < n.$$

To form the m leading columns of P^H when $m < n$:

$(8/3)n^2(3m - n^2)$ if $m > n$.

The real counterpart of this routine is [orgbr](#).

?unmbr

Multiplies an arbitrary complex matrix by the unitary matrix Q or P determined by ?gebrd.

Syntax

```
call cunmbr(vect, side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call zunmbr(vect, side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call unmbr(a, tau, c [,vect] [,side] [,trans] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

Given an arbitrary complex matrix C , this routine forms one of the matrix products Q^*C , Q^H*C , $C*Q$, $C*Q^H$, P^*C , P^H*C , $C*P$, or $C*P^H$, where Q and P are unitary matrices computed by a call to [gebrd/gebrd](#). The routine overwrites the product on C .

Input Parameters

In the descriptions below, r denotes the order of Q or P^H :

If $side = 'L'$, $r = m$; if $side = 'R'$, $r = n$.

<i>vect</i>	CHARACTER*1. Must be 'Q' or 'P'. If <i>vect</i> = 'Q', then Q or Q^H is applied to C . If <i>vect</i> = 'P', then P or P^H is applied to C .
<i>side</i>	CHARACTER*1. Must be 'L' or 'R'. If <i>side</i> = 'L', multipliers are applied to C from the left. If <i>side</i> = 'R', they are applied to C from the right.
<i>trans</i>	CHARACTER*1. Must be 'N' or 'C'. If <i>trans</i> = 'N', then Q or P is applied to C . If <i>trans</i> = 'C', then Q^H or P^H is applied to C .
<i>m</i>	INTEGER. The number of rows in C .
<i>n</i>	INTEGER. The number of columns in C .
<i>k</i>	INTEGER. One of the dimensions of A in ?gebrd: If <i>vect</i> = 'Q', the number of columns in A ; If <i>vect</i> = 'P', the number of rows in A . Constraints: $m \geq 0$, $n \geq 0$, $k \geq 0$.
<i>a, c, work</i>	COMPLEX for cunmbr

DOUBLE COMPLEX for zunmbr.

Arrays:

$a(lda,*)$ is the array a as returned by ?gebrd.

Its second dimension must be at least $\max(1, \min(r, k))$ for $vect = 'Q'$, or $\max(1, r)$ for $vect = 'P'$.

$c ldc,*)$ holds the matrix C .

Its second dimension must be at least $\max(1, n)$.

$work$ is a workspace array, its dimension $\max(1, lwork)$.

lda

INTEGER. The leading dimension of a . Constraints:

$lda \geq \max(1, r)$ if $vect = 'Q'$;

$lda \geq \max(1, \min(r, k))$ if $vect = 'P'$.

ldc

INTEGER. The leading dimension of c ; $ldc \geq \max(1, m)$.

tau

COMPLEX for cunmbr

DOUBLE COMPLEX for zunmbr.

Array, size at least $\max(1, \min(r, k))$.

For $vect = 'Q'$, the array $tauq$ as returned by ?gebrd. For $vect = 'P'$, the array $taup$ as returned by ?gebrd.

$lwork$

INTEGER. The size of the $work$ array.

$lwork \geq \max(1, n)$ if $side = 'L'$;

$lwork \geq \max(1, m)$ if $side = 'R'$.

$lwork \geq 1$ if $n=0$ or $m=0$.

For optimum performance $lwork \geq \max(1, n*nb)$ if $side = 'L'$, and $lwork \geq \max(1, m*nb)$ if $side = 'R'$, where nb is the optimal blocksize. ($nb = 0$ if $m = 0$ or $n = 0$.)

If $lwork = -1$, then a workspace query is assumed; the routine only calculates the optimal size of the $work$ array, returns this value as the first entry of the $work$ array, and no error message related to $lwork$ is issued by [xerbla](#).

See *Application Notes* for the suggested value of $lwork$.

Output Parameters

c

Overwritten by the product $Q*C$, Q^H*C , $C*Q$, $C*Q^H$, $P*C$, P^H*C , $C*P$, or $C*P^H$, as specified by $vect$, $side$, and $trans$.

$work(1)$

If $info = 0$, on exit $work(1)$ contains the minimum value of $lwork$ required for optimum performance. Use this $lwork$ for subsequent runs.

$info$

INTEGER.

If $info = 0$, the execution is successful.

If $info = -i$, the i -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `unmbr` interface are the following:

<i>a</i>	Holds the matrix <i>A</i> of size $(r, \min(nq, k))$ where $r = nq$, if <i>vect</i> = 'Q', $r = \min(nq, k)$, if <i>vect</i> = 'P', $nq = m$, if <i>side</i> = 'L', $nq = n$, if <i>side</i> = 'R', $k = m$, if <i>vect</i> = 'P', $k = n$, if <i>vect</i> = 'Q'.
<i>tau</i>	Holds the vector of length $\min(nq, k)$.
<i>c</i>	Holds the matrix <i>C</i> of size (m, n) .
<i>vect</i>	Must be 'Q' or 'P'. The default value is 'Q'.
<i>side</i>	Must be 'L' or 'R'. The default value is 'L'.
<i>trans</i>	Must be 'N' or 'C'. The default value is 'N'.

Application Notes

For better performance, use

lwork = *n***blocksize* for *side* = 'L', or

lwork = *m***blocksize* for *side* = 'R',

where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set *lwork* = -1.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If *lwork* = -1, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed product differs from the exact product by a matrix *E* such that $\|E\|_2 = O(\epsilon) * \|C\|_2$.

The total number of floating-point operations is approximately

$8 * n * k (2 * m - k)$ if *side* = 'L' and $m \geq k$;

$8 * m * k (2 * n - k)$ if *side* = 'R' and $n \geq k$;

$8 * m^2 * n$ if *side* = 'L' and $m < k$;

$8 * n^2 * m$ if *side* = 'R' and $n < k$.

The real counterpart of this routine is [ormbr](#).

?bdsqr

Computes the singular value decomposition of a general matrix that has been reduced to bidiagonal form.

Syntax

```
call sbdsqr(uplo, n, ncv, nru, ncc, d, e, vt, ldvt, u, ldu, c, ldc, work, info)
call dbdsqr(uplo, n, ncv, nru, ncc, d, e, vt, ldvt, u, ldu, c, ldc, work, info)
call cbdsqr(uplo, n, ncv, nru, ncc, d, e, vt, ldvt, u, ldu, c, ldc, rwork, info)
call zbdsqr(uplo, n, ncv, nru, ncc, d, e, vt, ldvt, u, ldu, c, ldc, rwork, info)
call rbdsqr(d, e [,vt] [,u] [,c] [,uplo] [,info])
call bdsqr(d, e [,vt] [,u] [,c] [,uplo] [,info])
```

Include Files

- `mk1.fi`, `lapack.f90`

Description

The routine computes the singular values and, optionally, the right and/or left singular vectors from the [Singular Value Decomposition](#) (SVD) of a real n -by- n (upper or lower) bidiagonal matrix B using the implicit zero-shift QR algorithm. The SVD of B has the form $B = Q^H S P^H$ where S is the diagonal matrix of singular values, Q is an orthogonal matrix of left singular vectors, and P is an orthogonal matrix of right singular vectors. If left singular vectors are requested, this subroutine actually returns $U^H Q$ instead of Q , and, if right singular vectors are requested, this subroutine returns $P^H VT$ instead of P^H , for given real/complex input matrices U and VT . When U and VT are the orthogonal/unitary matrices that reduce a general matrix A to bidiagonal form: $A = U^H B VT$, as computed by [?gebrd](#), then

$$A = (U^H Q) S (P^H VT)$$

is the SVD of A . Optionally, the subroutine may also compute $Q^H C$ for a given real/complex input matrix C . See also [lasq1](#), [lasq2](#), [lasq3](#), [lasq4](#), [lasq5](#), [lasq6](#) used by this routine.

Input Parameters

<code>uplo</code>	CHARACTER*1. Must be 'U' or 'L'. If <code>uplo</code> = 'U', B is an upper bidiagonal matrix. If <code>uplo</code> = 'L', B is a lower bidiagonal matrix.
<code>n</code>	INTEGER. The order of the matrix B ($n \geq 0$).
<code>ncvt</code>	INTEGER. The number of columns of the matrix VT , that is, the number of right singular vectors ($ncvt \geq 0$). Set <code>ncvt</code> = 0 if no right singular vectors are required.
<code>nru</code>	INTEGER. The number of rows in U , that is, the number of left singular vectors ($nru \geq 0$). Set <code>nru</code> = 0 if no left singular vectors are required.

<i>ncc</i>	<p>INTEGER. The number of columns in the matrix <i>C</i> used for computing the product $Q^H * C$ ($ncc \geq 0$). Set $ncc = 0$ if no matrix <i>C</i> is supplied.</p>
<i>d</i> , <i>e</i>	<p>REAL for single-precision flavors</p> <p>DOUBLE PRECISION for double-precision flavors.</p> <p>Arrays:</p> <p><i>d</i>(*) contains the diagonal elements of <i>B</i>.</p> <p>The size of <i>d</i> must be at least $\max(1, n)$.</p> <p><i>e</i>(*) contains the $(n-1)$ off-diagonal elements of <i>B</i>.</p> <p>The size of <i>e</i> must be at least $\max(1, n - 1)$.</p>
<i>work</i>	<p>REAL for sbdsqr</p> <p>DOUBLE PRECISION for dbdsqr.</p> <p><i>work</i>(*) is a workspace array.</p> <p>The size of <i>work</i> must be at least $\max(1, 4*n)$.</p>
<i>rwork</i>	<p>REAL for cbdsqr</p> <p>DOUBLE PRECISION for zbdsqr.</p> <p><i>rwork</i>(*) is a workspace array.</p> <p>The size of <i>rwork</i> must be at least $\max(1, 4*n)$.</p>
<i>vt</i> , <i>u</i> , <i>c</i>	<p>REAL for sbdsqr</p> <p>DOUBLE PRECISION for dbdsqr</p> <p>COMPLEX for cbdsqr</p> <p>DOUBLE COMPLEX for zbdsqr.</p> <p>Arrays:</p> <p><i>vt</i>(<i>ldvt</i>,*) contains an n-by-<i>ncvt</i> matrix <i>VT</i>.</p> <p>The second dimension of <i>vt</i> must be at least $\max(1, ncvt)$.</p> <p><i>vt</i> is not referenced if $ncvt = 0$.</p> <p><i>u</i>(<i>ldu</i>,*) contains an <i>nru</i> by n matrix <i>U</i>.</p> <p>The second dimension of <i>u</i> must be at least $\max(1, n)$.</p> <p><i>u</i> is not referenced if $nru = 0$.</p> <p><i>c</i>(<i>ldc</i>,*) contains the n-by-<i>ncc</i> matrix <i>C</i> for computing the product $Q^H * C$.</p> <p>The second dimension of <i>c</i> must be at least $\max(1, ncc)$. The array is not referenced if $ncc = 0$.</p>
<i>ldvt</i>	<p>INTEGER. The leading dimension of <i>vt</i>. Constraints:</p> <p>$ldvt \geq \max(1, n)$ if $ncvt > 0$;</p> <p>$ldvt \geq 1$ if $ncvt = 0$.</p>
<i>ldu</i>	<p>INTEGER. The leading dimension of <i>u</i>. Constraint:</p>

$ldu \geq \max(1, nru)$.

ldc

INTEGER. The leading dimension of *c*. Constraints:

$ldc \geq \max(1, n)$ if $ncc > 0$; $ldc \geq 1$ otherwise.

Output Parameters

d

On exit, if *info* = 0, overwritten by the singular values in decreasing order (see *info*).

e

On exit, if *info* = 0, *e* is destroyed. See also *info* below.

c

Overwritten by the product $Q^H * C$.

vt

On exit, this array is overwritten by $P^H * VT$. Not referenced if $ncvt = 0$.

u

On exit, this array is overwritten by $U * Q$. Not referenced if $nru = 0$.

info

INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* > 0,

If $ncvt = nru = ncc = 0$,

- *info* = 1, a split was marked by a positive value in *e*
- *info* = 2, the current block of *z* not diagonalized after 100**n* iterations (in the inner while loop)
- *info* = 3, termination criterion of the outer while loop is not met (the program created more than *n* unreduced blocks).

In all other cases when $ncvt$, nru , or $ncc > 0$, the algorithm did not converge; *d* and *e* contain the elements of a bidiagonal matrix that is orthogonally similar to the input matrix *B*; if *info* = *i*, *i* elements of *e* have not converged to zero.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `bdsqr` interface are the following:

d

Holds the vector of length (*n*).

e

Holds the vector of length (*n*).

vt

Holds the matrix *VT* of size (*n*, $ncvt$).

u

Holds the matrix *U* of size (nru, n).

c

Holds the matrix *C* of size (*n*, ncc).

uplo

Must be 'U' or 'L'. The default value is 'U'.

<i>ncvt</i>	If argument <i>vt</i> is present, then <i>ncvt</i> is equal to the number of columns in matrix <i>VT</i> ; otherwise, <i>ncvt</i> is set to zero.
<i>nru</i>	If argument <i>u</i> is present, then <i>nru</i> is equal to the number of rows in matrix <i>U</i> ; otherwise, <i>nru</i> is set to zero.
<i>ncc</i>	If argument <i>c</i> is present, then <i>ncc</i> is equal to the number of columns in matrix <i>C</i> ; otherwise, <i>ncc</i> is set to zero.

Note that two variants of Fortran 95 interface for `bdsqr` routine are needed because of an ambiguous choice between real and complex cases appear when *vt*, *u*, and *c* are omitted. Thus, the name `rbdsqr` is used in real cases (single or double precision), and the name `bdsqr` is used in complex cases (single or double precision).

Application Notes

Each singular value and singular vector is computed to high relative accuracy. However, the reduction to bidiagonal form (prior to calling the routine) may decrease the relative accuracy in the small singular values of the original matrix if its singular values vary widely in magnitude.

If s_i is an exact singular value of B , and s_i is the corresponding computed value, then

$$|s_i - \sigma_i| \leq p(m, n) * \varepsilon * \sigma_i$$

where $p(m, n)$ is a modestly increasing function of m and n , and ε is the machine precision.

If only singular values are computed, they are computed more accurately than when some singular vectors are also computed (that is, the function $p(m, n)$ is smaller).

If u_i is the corresponding exact left singular vector of B , and w_i is the corresponding computed left singular vector, then the angle $\theta(u_i, w_i)$ between them is bounded as follows:

$$\theta(u_i, w_i) \leq p(m, n) * \varepsilon / \min_{i \neq j} (|\sigma_i - \sigma_j| / |\sigma_i + \sigma_j|).$$

Here $\min_{i \neq j} (|\sigma_i - \sigma_j| / |\sigma_i + \sigma_j|)$ is the *relative gap* between σ_i and the other singular values. A similar error bound holds for the right singular vectors.

The total number of real floating-point operations is roughly proportional to n^2 if only the singular values are computed. About $6n^2 * nru$ additional operations ($12n^2 * nru$ for complex flavors) are required to compute the left singular vectors and about $6n^2 * ncvt$ operations ($12n^2 * ncvt$ for complex flavors) to compute the right singular vectors.

?bdsdc

Computes the singular value decomposition of a real bidiagonal matrix using a divide and conquer method.

Syntax

```
call sbdsdc(uplo, compq, n, d, e, u, ldu, vt, ldvt, q, iq, work, iwork, info)
call dbdsdc(uplo, compq, n, d, e, u, ldu, vt, ldvt, q, iq, work, iwork, info)
call bdsdc(d, e [,u] [,vt] [,q] [,iq] [,uplo] [,info])
```

Include Files

- `mkl.fi`, `lapack.f90`

Description

The routine computes the [Singular Value Decomposition](#) (SVD) of a real n -by- n (upper or lower) bidiagonal matrix B : $B = U \Sigma V^T$, using a divide and conquer method, where Σ is a diagonal matrix with non-negative diagonal elements (the singular values of B), and U and V are orthogonal matrices of left and right singular vectors, respectively. `?bdsdc` can be used to compute all singular values, and optionally, singular vectors or singular vectors in compact form.

This routine uses `?lasd0`, `?lasd1`, `?lasd2`, `?lasd3`, `?lasd4`, `?lasd5`, `?lasd6`, `?lasd7`, `?lasd8`, `?lasd9`, `?lasda`, `?lasdq`, `?lasdt`.

Input Parameters

<i>uplo</i>	<p>CHARACTER*1. Must be 'U' or 'L'.</p> <p>If <i>uplo</i> = 'U', B is an upper bidiagonal matrix.</p> <p>If <i>uplo</i> = 'L', B is a lower bidiagonal matrix.</p>
<i>compq</i>	<p>CHARACTER*1. Must be 'N', 'P', or 'I'.</p> <p>If <i>compq</i> = 'N', compute singular values only.</p> <p>If <i>compq</i> = 'P', compute singular values and compute singular vectors in compact form.</p> <p>If <i>compq</i> = 'I', compute singular values and singular vectors.</p>
<i>n</i>	<p>INTEGER. The order of the matrix B ($n \geq 0$).</p>
<i>d</i> , <i>e</i> , <i>work</i>	<p>REAL for <code>sbdsc</code></p> <p>DOUBLE PRECISION for <code>dbdsc</code>.</p> <p>Arrays:</p> <p><i>d</i>(*) contains the n diagonal elements of the bidiagonal matrix B. The size of <i>d</i> must be at least $\max(1, n)$.</p> <p><i>e</i>(*) contains the off-diagonal elements of the bidiagonal matrix B. The size of <i>e</i> must be at least $\max(1, n)$.</p> <p><i>work</i>(*) is a workspace array.</p> <p>The dimension of <i>work</i> must be at least:</p> <p>$\max(1, 4*n)$, if <i>compq</i> = 'N' or <i>compq</i> = 'P';</p> <p>$\max(1, 3*n^2+4*n)$, if <i>compq</i> = 'I'.</p>
<i>ldu</i>	<p>INTEGER. The leading dimension of the output array <i>u</i>; $ldu \geq 1$.</p> <p>If singular vectors are desired, then $ldu \geq \max(1, n)$.</p>
<i>ldvt</i>	<p>INTEGER. The leading dimension of the output array <i>vt</i>; $ldvt \geq 1$.</p> <p>If singular vectors are desired, then $ldvt \geq \max(1, n)$.</p>
<i>iwork</i>	<p>INTEGER. Workspace array, dimension at least $\max(1, 8*n)$.</p>

Output Parameters

<i>d</i>	If <i>info</i> = 0, overwritten by the singular values of B .
----------	---

<i>e</i>	On exit, <i>e</i> is overwritten.
<i>u</i> , <i>vt</i> , <i>q</i>	<p>REAL for sbdsdc</p> <p>DOUBLE PRECISION for dbdsdc.</p> <p>Arrays: <i>u</i>(<i>ldu</i>,*), <i>vt</i>(<i>ldvt</i>,*), <i>q</i>(*).</p> <p>If <i>compq</i> = 'I', then on exit <i>u</i> contains the left singular vectors of the bidiagonal matrix <i>B</i>, unless <i>info</i> ≠ 0 (<i>seeinfo</i>). For other values of <i>compq</i>, <i>u</i> is not referenced.</p> <p>The second dimension of <i>u</i> must be at least max(1,<i>n</i>).</p> <p>if <i>compq</i> = 'I', then on exit <i>vt</i>^T contains the right singular vectors of the bidiagonal matrix <i>B</i>, unless <i>info</i> ≠ 0 (<i>seeinfo</i>). For other values of <i>compq</i>, <i>vt</i> is not referenced. The second dimension of <i>vt</i> must be at least max(1,<i>n</i>).</p> <p>If <i>compq</i> = 'P', then on exit, if <i>info</i> = 0, <i>q</i> and <i>iq</i> contain the left and right singular vectors in a compact form. Specifically, <i>q</i> contains all the REAL (for sbdsdc) or DOUBLE PRECISION (for dbdsdc) data for singular vectors. For other values of <i>compq</i>, <i>q</i> is not referenced.</p>
<i>iq</i>	<p>INTEGER.</p> <p>Array: <i>iq</i>(*).</p> <p>If <i>compq</i> = 'P', then on exit, if <i>info</i> = 0, <i>q</i> and <i>iq</i> contain the left and right singular vectors in a compact form. Specifically, <i>iq</i> contains all the INTEGER data for singular vectors. For other values of <i>compq</i>, <i>iq</i> is not referenced.</p>
<i>info</i>	<p>INTEGER.</p> <p>If <i>info</i> = 0, the execution is successful.</p> <p>If <i>info</i> = -<i>i</i>, the <i>i</i>-th parameter had an illegal value.</p> <p>If <i>info</i> = <i>i</i>, the algorithm failed to compute a singular value. The update process of divide and conquer failed.</p>

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `bdsdc` interface are the following:

<i>d</i>	Holds the vector of length <i>n</i> .
<i>e</i>	Holds the vector of length <i>n</i> .
<i>u</i>	Holds the matrix <i>U</i> of size (<i>n</i> , <i>n</i>).
<i>vt</i>	Holds the matrix <i>VT</i> of size (<i>n</i> , <i>n</i>).
<i>q</i>	<p>Holds the vector of length (<i>ldq</i>), where</p> <p>$ldq \geq n * (11 + 2 * smlsiz + 8 * \text{int}(\log_2(n / (smlsiz + 1))))$ and <i>smlsiz</i> is returned by <i>ilaenv</i> and is equal to the maximum size of the subproblems at the bottom of the computation tree (usually about 25).</p>

compq

Restored based on the presence of arguments *u*, *vt*, *q*, and *iq* as follows:

compq = 'N', if none of *u*, *vt*, *q*, and *iq* are present,

compq = 'I', if both *u* and *vt* are present. Arguments *u* and *vt* must either be both present or both omitted,

compq = 'P', if both *q* and *iq* are present. Arguments *q* and *iq* must either be both present or both omitted.

Note that there will be an error condition if all of *u*, *vt*, *q*, and *iq* arguments are present simultaneously.

Symmetric Eigenvalue Problems

Symmetric eigenvalue problems are posed as follows: given an n -by- n real symmetric or complex Hermitian matrix A , find the *eigenvalues* λ and the corresponding *eigenvectors* z that satisfy the equation

$$Az = \lambda z \text{ (or, equivalently, } z^H A = \lambda z^H \text{)}.$$

In such eigenvalue problems, all n eigenvalues are real not only for real symmetric but also for complex Hermitian matrices A , and there exists an orthonormal system of n eigenvectors. If A is a symmetric or Hermitian positive-definite matrix, all eigenvalues are positive.

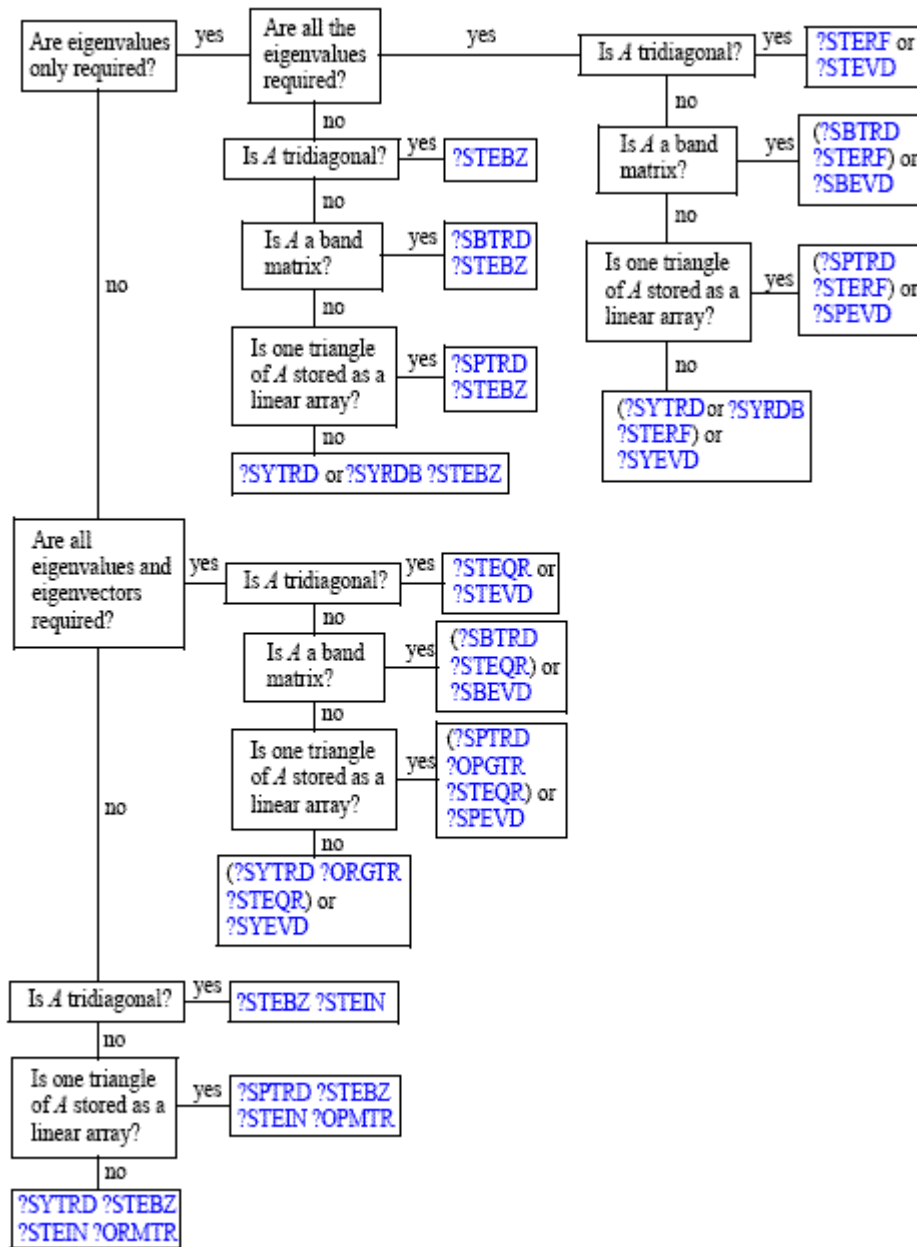

To solve a symmetric eigenvalue problem with LAPACK, you usually need to reduce the matrix to tridiagonal form and then solve the eigenvalue problem with the tridiagonal matrix obtained. LAPACK includes routines for reducing the matrix to a tridiagonal form by an orthogonal (or unitary) similarity transformation $A = QTQ^H$ as well as for solving tridiagonal symmetric eigenvalue problems. These routines (for FORTRAN 77 interface) are listed in [Table "Computational Routines for Solving Symmetric Eigenvalue Problems"](#). The corresponding routine names in the Fortran 95 interface are without the first symbol.

There are different routines for symmetric eigenvalue problems, depending on whether you need all eigenvectors or only some of them or eigenvalues only, whether the matrix A is positive-definite or not, and so on.

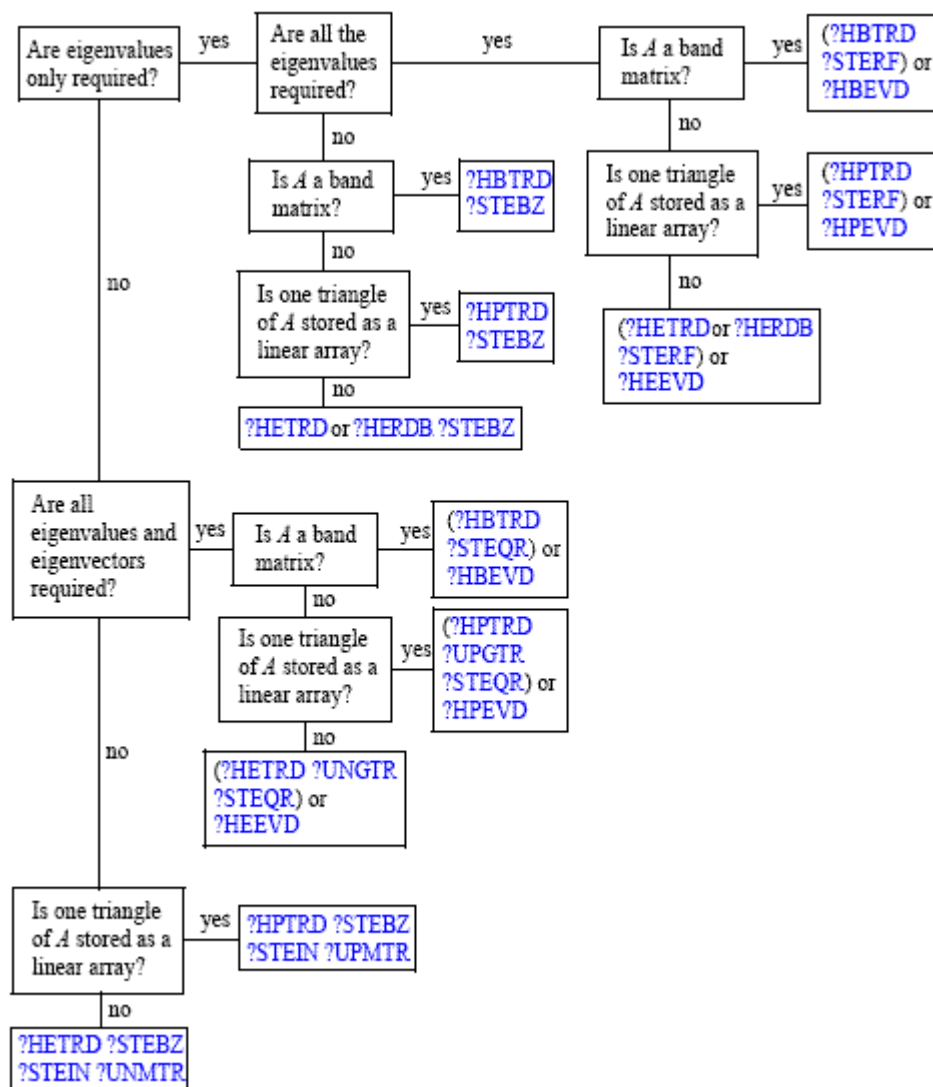

These routines are based on three primary algorithms for computing eigenvalues and eigenvectors of symmetric problems: the divide and conquer algorithm, the QR algorithm, and bisection followed by inverse iteration. The divide and conquer algorithm is generally more efficient and is recommended for computing all eigenvalues and eigenvectors. Furthermore, to solve an eigenvalue problem using the divide and conquer algorithm, you need to call only one routine. In general, more than one routine has to be called if the QR algorithm or bisection followed by inverse iteration is used.

The decision tree in [Figure "Decision Tree: Real Symmetric Eigenvalue Problems"](#) will help you choose the right routine or sequence of routines for eigenvalue problems with real symmetric matrices. [Figure "Decision Tree: Complex Hermitian Eigenvalue Problems"](#) presents a similar decision tree for complex Hermitian matrices.

?sytrd

Reduces a real symmetric matrix to tridiagonal form.

Syntax

```
call ssytrd(uplo, n, a, lda, d, e, tau, work, lwork, info)
call dsytrd(uplo, n, a, lda, d, e, tau, work, lwork, info)
call sytrd(a, tau [,uplo] [,info])
```

Include Files

- `mkl.fi`, `lapack.f90`

Description

The routine reduces a real symmetric matrix A to symmetric tridiagonal form T by an orthogonal similarity transformation: $A = Q^*T^*Q^T$. The orthogonal matrix Q is not formed explicitly but is represented as a product of $n-1$ elementary reflectors. Routines are provided for working with Q in this representation (see *Application Notes* below).

Input Parameters

uplo CHARACTER*1. Must be 'U' or 'L'.
 If **uplo** = 'U', **a** stores the upper triangular part of **A**.
 If **uplo** = 'L', **a** stores the lower triangular part of **A**.

n INTEGER. The order of the matrix **A** ($n \geq 0$).

a, work REAL for **ssytrd**
 DOUBLE PRECISION for **dsytrd**.

$a(lda,*)$ is an array containing either upper or lower triangular part of the matrix A , as specified by $uplo$. If $uplo = 'U'$, the leading n -by- n upper triangular part of a contains the upper triangular part of the matrix A , and the strictly lower triangular part of A is not referenced. If $uplo = 'L'$, the leading n -by- n lower triangular part of a contains the lower triangular part of the matrix A , and the strictly upper triangular part of A is not referenced.

The second dimension of a must be at least $\max(1, n)$.

$work$ is a workspace array, its dimension $\max(1, lwork)$.

lda

INTEGER. The leading dimension of a ; at least $\max(1, n)$.

$lwork$

INTEGER. The size of the $work$ array ($lwork \geq n$).

If $lwork = -1$, then a workspace query is assumed; the routine only calculates the optimal size of the $work$ array, returns this value as the first entry of the $work$ array, and no error message related to $lwork$ is issued by [xerbla](#).

See *Application Notes* for the suggested value of $lwork$.

Output Parameters

a

On exit,

if $uplo = 'U'$, the diagonal and first superdiagonal of A are overwritten by the corresponding elements of the tridiagonal matrix T , and the elements above the first superdiagonal, with the array tau , represent the orthogonal matrix Q as a product of elementary reflectors;

if $uplo = 'L'$, the diagonal and first subdiagonal of A are overwritten by the corresponding elements of the tridiagonal matrix T , and the elements below the first subdiagonal, with the array tau , represent the orthogonal matrix Q as a product of elementary reflectors.

d, e, tau

REAL for ssytrd

DOUBLE PRECISION for dsytrd.

Arrays:

$d(*)$ contains the diagonal elements of the matrix T .

The size of d must be at least $\max(1, n)$.

$e(*)$ contains the off-diagonal elements of T .

The size of e must be at least $\max(1, n-1)$.

$tau(*)$ stores $(n-1)$ scalars that define elementary reflectors in decomposition of the orthogonal matrix Q in a product of $n-1$ elementary reflectors. $tau(n)$ is used as workspace.

The size of tau must be at least $\max(1, n)$.

$work(1)$

If $info=0$, on exit $work(1)$ contains the minimum value of $lwork$ required for optimum performance. Use this $lwork$ for subsequent runs.

$info$

INTEGER.

If $info = 0$, the execution is successful.

If $info = -i$, the i -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `sytrd` interface are the following:

<code>a</code>	Holds the matrix A of size (n,n) .
<code>tau</code>	Holds the vector of length $(n-1)$.
<code>uplo</code>	Must be 'U' or 'L'. The default value is 'U'.

Note that diagonal (d) and off-diagonal (e) elements of the matrix T are omitted because they are kept in the matrix A on exit.

Application Notes

For better performance, try using `lwork = n*blocksize`, where `blocksize` is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If it is not clear how much workspace to supply, use a generous value of `lwork` for the first run, or set `lwork = -1`.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array `work` on exit. Use this value (`work(1)`) for subsequent runs.

If `lwork = -1`, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (`work`). This operation is called a workspace query.

Note that if `lwork` is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed matrix T is exactly similar to a matrix $A+E$, where $\|E\|_2 = c(n) * \epsilon * \|A\|_2$, $c(n)$ is a modestly increasing function of n , and ϵ is the machine precision.

The approximate number of floating-point operations is $(4/3)n^3$.

After calling this routine, you can call the following:

<code>orgtr</code>	to form the computed matrix Q explicitly
<code>ormtr</code>	to multiply a real matrix by Q .

The complex counterpart of this routine is [?hetrd](#).

?syldb

Reduces a real symmetric matrix to tridiagonal form with Successive Bandwidth Reduction approach.

Syntax

```
call ssyldb(jobz, uplo, n, kd, a, lda, d, e, tau, z, ldz, work, lwork, info)
call dsyldb(jobz, uplo, n, kd, a, lda, d, e, tau, z, ldz, work, lwork, info)
```

Include Files

- `mk1.fi`

Description

The routine reduces a real symmetric matrix A to symmetric tridiagonal form T by an orthogonal similarity transformation: $A = Q^*T^*Q^T$ and optionally multiplies matrix Z by Q , or simply forms Q .

This routine reduces a full symmetric matrix A to the banded symmetric matrix B , and then to the tridiagonal symmetric matrix T with a Successive Bandwidth Reduction approach after C. Bischof's works (see for instance, [Bischof00]). `?syrd` is functionally close to `?sytrd` routine but the tridiagonal form may differ from those obtained by `?sytrd`. Unlike `?sytrd`, the orthogonal matrix Q cannot be restored from the details of matrix A on exit.

Input Parameters

<i>jobz</i>	<p>CHARACTER*1. Must be 'N' or 'V'.</p> <p>If <i>jobz</i> = 'N', then only A is reduced to T.</p> <p>If <i>jobz</i> = 'V', then A is reduced to T and A contains Q on exit.</p> <p>If <i>jobz</i> = 'U', then A is reduced to T and Z contains Z^*Q on exit.</p>
<i>uplo</i>	<p>CHARACTER*1. Must be 'U' or 'L'.</p> <p>If <i>uplo</i> = 'U', a stores the upper triangular part of A.</p> <p>If <i>uplo</i> = 'L', a stores the lower triangular part of A.</p>
<i>n</i>	INTEGER. The order of the matrix A ($n \geq 0$).
<i>kd</i>	INTEGER. The bandwidth of the banded matrix B ($kd \geq 1$, $kd \leq n-1$).
<i>a,z, work</i>	<p>REAL for <code>ssyrd</code>.</p> <p>DOUBLE PRECISION for <code>dsyrd</code>.</p> <p>$a(lda,*)$ is an array containing either upper or lower triangular part of the matrix A, as specified by <i>uplo</i>.</p> <p>The second dimension of a must be at least $\max(1, n)$.</p> <p>$z(ldz,*)$, the second dimension of z must be at least $\max(1, n)$.</p> <p>If <i>jobz</i> = 'U', then the matrix z is multiplied by Q.</p> <p>If <i>jobz</i> = 'N' or 'V', then z is not referenced.</p> <p><i>work(lwork)</i> is a workspace array.</p>
<i>lda</i>	INTEGER. The leading dimension of a ; at least $\max(1, n)$.
<i>ldz</i>	INTEGER. The leading dimension of z ; at least $\max(1, n)$. Not referenced if <i>jobz</i> = 'N'
<i>lwork</i>	<p>INTEGER. The size of the <i>work</i> array ($lwork \geq (2kd+1)n+kd$).</p> <p>If <i>lwork</i> = -1, then a workspace query is assumed; the routine only calculates the optimal size of the <i>work</i> array, returns this value as the first entry of the <i>work</i> array, and no error message related to <i>lwork</i> is issued by xerbla.</p>

See *Application Notes* for the suggested value of *lwork*.

Output Parameters

<i>a</i>	<p>If <i>jobz</i> = 'V', then overwritten by <i>Q</i> matrix.</p> <p>If <i>jobz</i> = 'N' or 'U', then overwritten by the banded matrix <i>B</i> and details of the orthogonal matrix <i>Q_B</i> to reduce <i>A</i> to <i>B</i> as specified by <i>uplo</i>.</p>
<i>z</i>	<p>On exit,</p> <p>if <i>jobz</i> = 'U', then the matrix <i>z</i> is overwritten by <i>Z*Q</i>.</p> <p>If <i>jobz</i> = 'N' or 'V', then <i>z</i> is not referenced.</p>
<i>d</i> , <i>e</i> , <i>tau</i>	<p>DOUBLE PRECISION.</p> <p>Arrays:</p> <p><i>d</i>(*) contains the diagonal elements of the matrix <i>T</i>.</p> <p>The dimension of <i>d</i> must be at least $\max(1, n)$.</p> <p><i>e</i>(*) contains the off-diagonal elements of <i>T</i>.</p> <p>The dimension of <i>e</i> must be at least $\max(1, n-1)$.</p> <p><i>tau</i>(*) stores further details of the orthogonal matrix <i>Q</i>.</p> <p>The dimension of <i>tau</i> must be at least $\max(1, n-kd-1)$.</p>
<i>work</i> (1)	<p>If <i>info</i>=0, on exit <i>work</i>(1) contains the minimum value of <i>lwork</i> required for optimum performance. Use this <i>lwork</i> for subsequent runs.</p>
<i>info</i>	<p>INTEGER.</p> <p>If <i>info</i> = 0, the execution is successful.</p> <p>If <i>info</i> = -<i>i</i>, the <i>i</i>-th parameter had an illegal value.</p>

Application Notes

For better performance, try using $lwork = n*(3*kd+3)$.

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set *lwork* = -1.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If *lwork* = -1, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

For better performance, try using *kd* equal to 40 if $n \leq 2000$ and 64 otherwise.

Try using ?syrdB instead of ?sytrd on large matrices obtaining only eigenvalues - when no eigenvectors are needed, especially in multi-threaded environment. ?syrdB becomes faster beginning approximately with $n = 1000$, and much faster at larger matrices with a better scalability than ?sytrd.

Avoid applying ?syrdB for computing eigenvectors due to the two-step reduction, that is, the number of operations needed to apply orthogonal transformations to Z is doubled compared to the traditional one-step reduction. In that case it is better to apply ?sytrd and ?ormtr/?orgtr to obtain tridiagonal form along with the orthogonal transformation matrix Q .

?herdb

Reduces a complex Hermitian matrix to tridiagonal form with Successive Bandwidth Reduction approach.

Syntax

```
call cherdb(jobz, uplo, n, kd, a, lda, d, e, tau, z, ldz, work, lwork, info)
call zherdb(jobz, uplo, n, kd, a, lda, d, e, tau, z, ldz, work, lwork, info)
```

Include Files

- mkl.fi

Description

The routine reduces a complex Hermitian matrix A to symmetric tridiagonal form T by a unitary similarity transformation: $A = Q^* T Q^T$ and optionally multiplies matrix Z by Q , or simply forms Q .

This routine reduces a full symmetric matrix A to the banded symmetric matrix B , and then to the tridiagonal symmetric matrix T with a Successive Bandwidth Reduction approach after C. Bischof's works (see for instance, [Bischof00]). ?herdb is functionally close to ?hetrd routine but the tridiagonal form may differ from those obtained by ?hetrd. Unlike ?hetrd, the orthogonal matrix Q cannot be restored from the details of matrix A on exit.

Input Parameters

<i>jobz</i>	CHARACTER*1. Must be 'N' or 'V'. If <i>jobz</i> = 'N', then only A is reduced to T . If <i>jobz</i> = 'V', then A is reduced to T and A contains Q on exit. If <i>jobz</i> = 'U', then A is reduced to T and Z contains Z^*Q on exit.
<i>uplo</i>	CHARACTER*1. Must be 'U' or 'L'. If <i>uplo</i> = 'U', a stores the upper triangular part of A . If <i>uplo</i> = 'L', a stores the lower triangular part of A .
<i>n</i>	INTEGER. The order of the matrix A ($n \geq 0$).
<i>kd</i>	INTEGER. The bandwidth of the banded matrix B ($kd \geq 1$, $kd \leq n-1$).
<i>a, z, work</i>	COMPLEX for cherdb. DOUBLE COMPLEX for zherdb. $a(lda,*)$ is an array containing either upper or lower triangular part of the matrix A , as specified by <i>uplo</i> . The second dimension of a must be at least $\max(1, n)$. $z(ldz,*)$, the second dimension of z must be at least $\max(1, n)$. If <i>jobz</i> = 'U', then the matrix z is multiplied by Q .

If $jobz = 'N'$ or $'V'$, then z is not referenced.

$work(lwork)$ is a workspace array.

lda INTEGER. The leading dimension of a ; at least $\max(1, n)$.

ldz INTEGER. The leading dimension of z ; at least $\max(1, n)$. Not referenced if $jobz = 'N'$

$lwork$ INTEGER. The size of the $work$ array ($lwork \geq (2kd+1)n+kd$).
If $lwork = -1$, then a workspace query is assumed; the routine only calculates the optimal size of the $work$ array, returns this value as the first entry of the $work$ array, and no error message related to $lwork$ is issued by [xerbla](#).

See *Application Notes* for the suggested value of $lwork$.

Output Parameters

a If $jobz = 'V'$, then overwritten by Q matrix.

If $jobz = 'N'$ or $'U'$, then overwritten by the banded matrix B and details of the unitary matrix Q_B to reduce A to B as specified by $uplo$.

z On exit,
if $jobz = 'U'$, then the matrix z is overwritten by Z^*Q .
If $jobz = 'N'$ or $'V'$, then z is not referenced.

d, e REAL for `cherdb`.
DOUBLE PRECISION for `zherdb`.

Arrays:

$d(*)$ contains the diagonal elements of the matrix T .

The dimension of d must be at least $\max(1, n)$.

$e(*)$ contains the off-diagonal elements of T .

The dimension of e must be at least $\max(1, n-1)$.

$tau(*)$ stores further details of the orthogonal matrix Q .

The dimension of tau must be at least $\max(1, n-kd-1)$.

tau COMPLEX for `cherdb`.
DOUBLE COMPLEX for `zherdb`.

Array, size at least $\max(1, n-1)$

Stores further details of the unitary matrix Q_B . The dimension of tau must be at least $\max(1, n-kd-1)$.

$work(1)$ If $info=0$, on exit $work(1)$ contains the minimum value of $lwork$ required for optimum performance. Use this $lwork$ for subsequent runs.

$info$ INTEGER.
If $info = 0$, the execution is successful.

If $info = -i$, the i -th parameter had an illegal value.

Application Notes

For better performance, try using $lwork = n*(3*kd+3)$.

If it is not clear how much workspace to supply, use a generous value of $lwork$ for the first run, or set $lwork = -1$.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array $work$ on exit. Use this value ($work(1)$) for subsequent runs.

If $lwork = -1$, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array ($work$). This operation is called a workspace query.

Note that if $lwork$ is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

For better performance, try using kd equal to 40 if $n \leq 2000$ and 64 otherwise.

Try using `?herdb` instead of `?hetrd` on large matrices obtaining only eigenvalues - when no eigenvectors are needed, especially in multi-threaded environment. `?herdb` becomes faster beginning approximately with $n = 1000$, and much faster at larger matrices with a better scalability than `?hetrd`.

Avoid applying `?herdb` for computing eigenvectors due to the two-step reduction, that is, the number of operations needed to apply orthogonal transformations to Z is doubled compared to the traditional one-step reduction. In that case it is better to apply `?hetrd` and `?unmtr`/`?ungtr` to obtain tridiagonal form along with the unitary transformation matrix Q .

?orgtr

Generates the real orthogonal matrix Q determined by ?sytrd.

Syntax

```
call sorgtr(uplo, n, a, lda, tau, work, lwork, info)
call dorgtr(uplo, n, a, lda, tau, work, lwork, info)
call orgtr(a, tau [,uplo] [,info])
```

Include Files

- `mkl.fi`, `lapack.f90`

Description

The routine explicitly generates the n -by- n orthogonal matrix Q formed by `sytrd` when reducing a real symmetric matrix A to tridiagonal form: $A = Q^T T Q$. Use this routine after a call to `?sytrd`.

Input Parameters

$uplo$	CHARACTER*1. Must be 'U' or 'L'. Use the same $uplo$ as supplied to <code>?sytrd</code> .
n	INTEGER. The order of the matrix Q ($n \geq 0$).
$a, tau, work$	REAL for <code>sorgtr</code>

DOUBLE PRECISION for `dorgtr`.

Arrays:

$a(lda,*)$ is the array a as returned by `?sytrd`.

The second dimension of a must be at least $\max(1, n)$.

$\tau(*)$ is the array τ as returned by `?sytrd`.

The size of τ must be at least $\max(1, n-1)$.

$work$ is a workspace array, its dimension $\max(1, lwork)$.

lda INTEGER. The leading dimension of a ; at least $\max(1, n)$.

$lwork$ INTEGER. The size of the $work$ array ($lwork \geq n$).

If $lwork = -1$, then a workspace query is assumed; the routine only calculates the optimal size of the $work$ array, returns this value as the first entry of the $work$ array, and no error message related to $lwork$ is issued by [xerbla](#).

See *Application Notes* for the suggested value of $lwork$.

Output Parameters

a Overwritten by the orthogonal matrix Q .

$work(1)$ If $info = 0$, on exit $work(1)$ contains the minimum value of $lwork$ required for optimum performance. Use this $lwork$ for subsequent runs.

$info$ INTEGER.

If $info = 0$, the execution is successful.

If $info = -i$, the i -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `orgtr` interface are the following:

a Holds the matrix A of size (n,n) .

τ Holds the vector of length $(n-1)$.

$uplo$ Must be 'U' or 'L'. The default value is 'U'.

Application Notes

For better performance, try using $lwork = (n-1)*blocksize$, where $blocksize$ is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of $lwork$ for the first run or set $lwork = -1$.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed matrix *Q* differs from an exactly orthogonal matrix by a matrix *E* such that $\|E\|_2 = O(\varepsilon)$, where ε is the machine precision.

The approximate number of floating-point operations is $(4/3)n^3$.

The complex counterpart of this routine is [ungtr](#).

?ormtr

Multiplies a real matrix by the real orthogonal matrix Q determined by ?sytrd.

Syntax

```
call sormtr(side, uplo, trans, m, n, a, lda, tau, c, ldc, work, lwork, info)
call dormtr(side, uplo, trans, m, n, a, lda, tau, c, ldc, work, lwork, info)
call ormtr(a, tau, c [,side] [,uplo] [,trans] [,info])
```

Include Files

- `mk1.fi`, `lapack.f90`

Description

The routine multiplies a real matrix *C* by *Q* or Q^T , where *Q* is the orthogonal matrix *Q* formed by [sytrd](#) when reducing a real symmetric matrix *A* to tridiagonal form: $A = Q^T Q$. Use this routine after a call to [?sytrd](#).

Depending on the parameters *side* and *trans*, the routine can form one of the matrix products $Q^T C$, $Q^T C$, $C^T Q$, or $C^T Q^T$ (overwriting the result on *C*).

Input Parameters

In the descriptions below, *r* denotes the order of *Q*:

If *side* = 'L', *r* = *m*; if *side* = 'R', *r* = *n*.

<i>side</i>	CHARACTER*1. Must be either 'L' or 'R'. If <i>side</i> = 'L', <i>Q</i> or Q^T is applied to <i>C</i> from the left. If <i>side</i> = 'R', <i>Q</i> or Q^T is applied to <i>C</i> from the right.
<i>uplo</i>	CHARACTER*1. Must be 'U' or 'L'. Use the same <i>uplo</i> as supplied to ?sytrd .
<i>trans</i>	CHARACTER*1. Must be either 'N' or 'T'. If <i>trans</i> = 'N', the routine multiplies <i>C</i> by <i>Q</i> . If <i>trans</i> = 'T', the routine multiplies <i>C</i> by Q^T .

m	INTEGER. The number of rows in the matrix C ($m \geq 0$).
n	INTEGER. The number of columns in C ($n \geq 0$).
$a, c, \tau, work$	<p>REAL for <code>sormtr</code></p> <p>DOUBLE PRECISION for <code>dormtr</code></p> <p>$a(lda,*)$ and τ are the arrays returned by <code>?sytrd</code>.</p> <p>The second dimension of a must be at least $\max(1, r)$.</p> <p>The size of τ must be at least $\max(1, r-1)$.</p> <p>$c ldc, *$ contains the matrix C.</p> <p>The second dimension of c must be at least $\max(1, n)$</p> <p>$work$ is a workspace array, its dimension $\max(1, lwork)$.</p>
lda	INTEGER. The leading dimension of a ; $lda \geq \max(1, r)$.
ldc	INTEGER. The leading dimension of c ; $ldc \geq \max(1, m)$.
$lwork$	<p>INTEGER. The size of the $work$ array. Constraints:</p> <p>$lwork \geq \max(1, n)$ if $side = 'L'$;</p> <p>$lwork \geq \max(1, m)$ if $side = 'R'$.</p> <p>If $lwork = -1$, then a workspace query is assumed; the routine only calculates the optimal size of the $work$ array, returns this value as the first entry of the $work$ array, and no error message related to $lwork$ is issued by xerbla.</p> <p>See <i>Application Notes</i> for the suggested value of $lwork$.</p>

Output Parameters

c	Overwritten by the product Q^*C , $Q^T C$, C^*Q , or C^*Q^T (as specified by $side$ and $trans$).
$work(1)$	If $info = 0$, on exit $work(1)$ contains the minimum value of $lwork$ required for optimum performance. Use this $lwork$ for subsequent runs.
$info$	<p>INTEGER.</p> <p>If $info = 0$, the execution is successful.</p> <p>If $info = -i$, the i-th parameter had an illegal value.</p>

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `ormtr` interface are the following:

a	Holds the matrix A of size (r, r) .
	$r = m$ if $side = 'L'$.

	$r = n$ if $side = 'R'$.
τ	Holds the vector of length $(r-1)$.
c	Holds the matrix C of size (m,n) .
$side$	Must be 'L' or 'R'. The default value is 'L'.
$uplo$	Must be 'U' or 'L'. The default value is 'U'.
$trans$	Must be 'N' or 'T'. The default value is 'N'.

Application Notes

For better performance, try using $lwork = n*blocksize$ for $side = 'L'$, or $lwork = m*blocksize$ for $side = 'R'$, where $blocksize$ is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of $lwork$ for the first run or set $lwork = -1$.

If you choose the first option and set any of admissible $lwork$ sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array $work$ on exit. Use this value ($work(1)$) for subsequent runs.

If you set $lwork = -1$, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array ($work$). This operation is called a workspace query.

Note that if you set $lwork$ to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed product differs from the exact product by a matrix E such that $\|E\|_2 = O(\epsilon) * \|C\|_2$.

The total number of floating-point operations is approximately $2*m^2*n$, if $side = 'L'$, or $2*n^2*m$, if $side = 'R'$.

The complex counterpart of this routine is [unmtr](#).

?hetrd

Reduces a complex Hermitian matrix to tridiagonal form.

Syntax

```
call chetrd(uplo, n, a, lda, d, e, tau, work, lwork, info)
call zhetrd(uplo, n, a, lda, d, e, tau, work, lwork, info)
call hetrd(a, tau [,uplo] [,info])
```

Include Files

- `mk1.fi`, `lapack.f90`

Description

The routine reduces a complex Hermitian matrix A to symmetric tridiagonal form T by a unitary similarity transformation: $A = Q * T * Q^H$. The unitary matrix Q is not formed explicitly but is represented as a product of $n-1$ elementary reflectors. Routines are provided to work with Q in this representation. (They are described later in this section.)

Input Parameters

<i>uplo</i>	<p>CHARACTER*1. Must be 'U' or 'L'.</p> <p>If <i>uplo</i> = 'U', <i>a</i> stores the upper triangular part of <i>A</i>.</p> <p>If <i>uplo</i> = 'L', <i>a</i> stores the lower triangular part of <i>A</i>.</p>
<i>n</i>	<p>INTEGER. The order of the matrix <i>A</i> ($n \geq 0$).</p>
<i>a, work</i>	<p>COMPLEX for <i>chetrd</i></p> <p>DOUBLE COMPLEX for <i>zhetr</i>d.</p> <p><i>a</i>(<i>lda</i>,*) is an array containing either upper or lower triangular part of the matrix <i>A</i>, as specified by <i>uplo</i>. If <i>uplo</i> = 'U', the leading <i>n</i>-by-<i>n</i> upper triangular part of <i>a</i> contains the upper triangular part of the matrix <i>A</i>, and the strictly lower triangular part of <i>A</i> is not referenced. If <i>uplo</i> = 'L', the leading <i>n</i>-by-<i>n</i> lower triangular part of <i>a</i> contains the lower triangular part of the matrix <i>A</i>, and the strictly upper triangular part of <i>A</i> is not referenced.</p> <p>The second dimension of <i>a</i> must be at least $\max(1, n)$.</p> <p><i>work</i> is a workspace array, its dimension $\max(1, lwork)$.</p>
<i>lda</i>	<p>INTEGER. The leading dimension of <i>a</i>; at least $\max(1, n)$.</p>
<i>lwork</i>	<p>INTEGER. The size of the <i>work</i> array ($lwork \geq n$).</p> <p>If <i>lwork</i> = -1, then a workspace query is assumed; the routine only calculates the optimal size of the <i>work</i> array, returns this value as the first entry of the <i>work</i> array, and no error message related to <i>lwork</i> is issued by xerbla.</p> <p>See <i>Application Notes</i> for the suggested value of <i>lwork</i>.</p>

Output Parameters

<i>a</i>	<p>On exit,</p> <p>if <i>uplo</i> = 'U', the diagonal and first superdiagonal of <i>A</i> are overwritten by the corresponding elements of the tridiagonal matrix <i>T</i>, and the elements above the first superdiagonal, with the array <i>tau</i>, represent the orthogonal matrix <i>Q</i> as a product of elementary reflectors;</p> <p>if <i>uplo</i> = 'L', the diagonal and first subdiagonal of <i>A</i> are overwritten by the corresponding elements of the tridiagonal matrix <i>T</i>, and the elements below the first subdiagonal, with the array <i>tau</i>, represent the orthogonal matrix <i>Q</i> as a product of elementary reflectors.</p>
<i>d, e</i>	<p>REAL for <i>chetrd</i></p> <p>DOUBLE PRECISION for <i>zhetr</i>d.</p> <p>Arrays:</p> <p><i>d</i>(*) contains the diagonal elements of the matrix <i>T</i>.</p> <p>The dimension of <i>d</i> must be at least $\max(1, n)$.</p> <p><i>e</i>(*) contains the off-diagonal elements of <i>T</i>.</p> <p>The dimension of <i>e</i> must be at least $\max(1, n-1)$.</p>

<i>tau</i>	COMPLEX for <code>chetrd</code> DOUBLE COMPLEX for <code>zhetr</code> d. Array, size at least $\max(1, n-1)$. Stores $(n-1)$ scalars that define elementary reflectors in decomposition of the unitary matrix Q in a product of $n-1$ elementary reflectors.
<i>work</i> (1)	If <i>info</i> = 0, on exit <i>work</i> (1) contains the minimum value of <i>lwork</i> required for optimum performance. Use this <i>lwork</i> for subsequent runs.
<i>info</i>	INTEGER. If <i>info</i> = 0, the execution is successful. If <i>info</i> = - <i>i</i> , the <i>i</i> -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `hetrd` interface are the following:

<i>a</i>	Holds the matrix A of size (n,n) .
<i>tau</i>	Holds the vector of length $(n-1)$.
<i>uplo</i>	Must be 'U' or 'L'. The default value is 'U'.

Note that diagonal (d) and off-diagonal (e) elements of the matrix T are omitted because they are kept in the matrix A on exit.

Application Notes

For better performance, try using $lwork = n * blocksize$, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set $lwork = -1$.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set $lwork = -1$, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed matrix T is exactly similar to a matrix $A + E$, where $\|E\|_2 = c(n) * \epsilon * \|A\|_2$, $c(n)$ is a modestly increasing function of n , and ϵ is the machine precision.

The approximate number of floating-point operations is $(16/3) n^3$.

After calling this routine, you can call the following:

<code>ungtr</code>	to form the computed matrix Q explicitly
<code>unmtr</code>	to multiply a complex matrix by Q .

The real counterpart of this routine is [?sytrd](#).

?ungtr

Generates the complex unitary matrix Q determined by ?hetrd.

Syntax

```
call cungrtr(uplo, n, a, lda, tau, work, lwork, info)
call zungrtr(uplo, n, a, lda, tau, work, lwork, info)
call ungtr(a, tau [,uplo] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine explicitly generates the n -by- n unitary matrix Q formed by [hetrd](#) when reducing a complex Hermitian matrix A to tridiagonal form: $A = Q^*T^*Q^H$. Use this routine after a call to ?hetrd.

Input Parameters

<i>uplo</i>	CHARACTER*1. Must be 'U' or 'L'. Use the same <i>uplo</i> as supplied to ?hetrd.
<i>n</i>	INTEGER. The order of the matrix Q ($n \geq 0$).
<i>a</i> , <i>tau</i> , <i>work</i>	COMPLEX for cungrtr DOUBLE COMPLEX for zungrtr. Arrays: <i>a</i> (<i>lda</i> ,*) is the array <i>a</i> as returned by ?hetrd. The second dimension of <i>a</i> must be at least $\max(1, n)$. <i>tau</i> (*) is the array <i>tau</i> as returned by ?hetrd. The dimension of <i>tau</i> must be at least $\max(1, n-1)$. <i>work</i> is a workspace array, its dimension $\max(1, lwork)$.
<i>lda</i>	INTEGER. The leading dimension of <i>a</i> ; at least $\max(1, n)$.
<i>lwork</i>	INTEGER. The size of the <i>work</i> array ($lwork \geq n$). If $lwork = -1$, then a workspace query is assumed; the routine only calculates the optimal size of the <i>work</i> array, returns this value as the first entry of the <i>work</i> array, and no error message related to <i>lwork</i> is issued by xerbla . See <i>Application Notes</i> for the suggested value of <i>lwork</i> .

Output Parameters

<i>a</i>	Overwritten by the unitary matrix Q .
<i>work</i> (1)	If $info = 0$, on exit <i>work</i> (1) contains the minimum value of <i>lwork</i> required for optimum performance. Use this <i>lwork</i> for subsequent runs.

info INTEGER.
 If *info* = 0, the execution is successful.
 If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `ungtr` interface are the following:

a Holds the matrix *A* of size (*n*,*n*).
tau Holds the vector of length (*n*-1).
uplo Must be 'U' or 'L'. The default value is 'U'.

Application Notes

For better performance, try using $lwork = (n-1)*blocksize$, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set *lwork* = -1.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If *lwork* = -1, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed matrix *Q* differs from an exactly unitary matrix by a matrix *E* such that $\|E\|_2 = O(\varepsilon)$, where ε is the machine precision.

The approximate number of floating-point operations is $(16/3)n^3$.

The real counterpart of this routine is [orgtr](#).

?unmtr

Multiplies a complex matrix by the complex unitary matrix Q determined by ?hetrd.

Syntax

```
call cunmtr(side, uplo, trans, m, n, a, lda, tau, c, ldc, work, lwork, info)
call zunmtr(side, uplo, trans, m, n, a, lda, tau, c, ldc, work, lwork, info)
call unmtr(a, tau, c [,side] [,uplo] [,trans] [,info])
```

Include Files

- `mk1.fi`, `lapack.f90`

Description

The routine multiplies a complex matrix C by Q or Q^H , where Q is the unitary matrix Q formed by [hetrd](#) when reducing a complex Hermitian matrix A to tridiagonal form: $A = Q^*T^*Q^H$. Use this routine after a call to [?hetrd](#).

Depending on the parameters *side* and *trans*, the routine can form one of the matrix products Q^*C , Q^H^*C , C^*Q , or C^*Q^H (overwriting the result on C).

Input Parameters

In the descriptions below, r denotes the order of Q :

If *side* = 'L', $r = m$; if *side* = 'R', $r = n$.

<i>side</i>	<p>CHARACTER*1. Must be either 'L' or 'R'.</p> <p>If <i>side</i> = 'L', Q or Q^H is applied to C from the left.</p> <p>If <i>side</i> = 'R', Q or Q^H is applied to C from the right.</p>
<i>uplo</i>	<p>CHARACTER*1. Must be 'U' or 'L'.</p> <p>Use the same <i>uplo</i> as supplied to ?hetrd.</p>
<i>trans</i>	<p>CHARACTER*1. Must be either 'N' or 'T'.</p> <p>If <i>trans</i> = 'N', the routine multiplies C by Q.</p> <p>If <i>trans</i> = 'C', the routine multiplies C by Q^H.</p>
<i>m</i>	INTEGER. The number of rows in the matrix C ($m \geq 0$).
<i>n</i>	INTEGER. The number of columns in C ($n \geq 0$).
<i>a</i> , <i>c</i> , <i>tau</i> , <i>work</i>	<p>COMPLEX for cunmtr</p> <p>DOUBLE COMPLEX for zunmtr.</p> <p><i>a</i>(<i>lda</i>,*) and <i>tau</i> are the arrays returned by ?hetrd.</p> <p>The second dimension of <i>a</i> must be at least $\max(1, r)$.</p> <p>The dimension of <i>tau</i> must be at least $\max(1, r-1)$.</p> <p><i>c</i>(<i>ldc</i>,*) contains the matrix C.</p> <p>The second dimension of <i>c</i> must be at least $\max(1, n)$</p> <p><i>work</i> is a workspace array, its dimension $\max(1, lwork)$.</p>
<i>lda</i>	INTEGER. The leading dimension of <i>a</i> ; $lda \geq \max(1, r)$.
<i>ldc</i>	INTEGER. The leading dimension of <i>c</i> ; $ldc \geq \max(1, n)$.
<i>lwork</i>	<p>INTEGER. The size of the <i>work</i> array. Constraints:</p> <p>$lwork \geq \max(1, n)$ if <i>side</i> = 'L';</p> <p>$lwork \geq \max(1, m)$ if <i>side</i> = 'R'.</p> <p>If <i>lwork</i> = -1, then a workspace query is assumed; the routine only calculates the optimal size of the <i>work</i> array, returns this value as the first entry of the <i>work</i> array, and no error message related to <i>lwork</i> is issued by xerbla.</p> <p>See <i>Application Notes</i> for the suggested value of <i>lwork</i>.</p>

Output Parameters

<i>c</i>	Overwritten by the product $Q^H C$, $Q^H C$, $C^H Q$, or $C^H Q^H$ (as specified by <i>side</i> and <i>trans</i>).
<i>work</i> (1)	If <i>info</i> = 0, on exit <i>work</i> (1) contains the minimum value of <i>lwork</i> required for optimum performance. Use this <i>lwork</i> for subsequent runs.
<i>info</i>	INTEGER. If <i>info</i> = 0, the execution is successful. If <i>info</i> = - <i>i</i> , the <i>i</i> -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `unmtr` interface are the following:

<i>a</i>	Holds the matrix <i>A</i> of size (<i>r</i> , <i>r</i>). $r = m$ if <i>side</i> = 'L'. $r = n$ if <i>side</i> = 'R'.
<i>tau</i>	Holds the vector of length (<i>r</i> -1).
<i>c</i>	Holds the matrix <i>C</i> of size (<i>m</i> , <i>n</i>).
<i>side</i>	Must be 'L' or 'R'. The default value is 'L'.
<i>uplo</i>	Must be 'U' or 'L'. The default value is 'U'.
<i>trans</i>	Must be 'N' or 'C'. The default value is 'N'.

Application Notes

For better performance, try using *lwork* = *n***blocksize* (for *side* = 'L') or *lwork* = *m***blocksize* (for *side* = 'R') where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set *lwork* = -1.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If *lwork* = -1, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed product differs from the exact product by a matrix *E* such that $\|E\|_2 = O(\epsilon) * \|C\|_2$, where ϵ is the machine precision.

The total number of floating-point operations is approximately $8*m^2*n$ if *side* = 'L' or $8*n^2*m$ if *side* = 'R'.

The real counterpart of this routine is [ormtr](#).

?sptdr

Reduces a real symmetric matrix to tridiagonal form using packed storage.

Syntax

```
call ssptdr(uplo, n, ap, d, e, tau, info)
call dsptdr(uplo, n, ap, d, e, tau, info)
call sptdr(ap, tau [,uplo] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine reduces a packed real symmetric matrix A to symmetric tridiagonal form T by an orthogonal similarity transformation: $A = Q^*T^*Q^T$. The orthogonal matrix Q is not formed explicitly but is represented as a product of $n-1$ elementary reflectors. Routines are provided for working with Q in this representation. See *Application Notes* below for details.

Input Parameters

<i>uplo</i>	CHARACTER*1. Must be 'U' or 'L'. If <i>uplo</i> = 'U', <i>ap</i> stores the packed upper triangle of A . If <i>uplo</i> = 'L', <i>ap</i> stores the packed lower triangle of A .
<i>n</i>	INTEGER. The order of the matrix A ($n \geq 0$).
<i>ap</i>	REAL for ssptdr DOUBLE PRECISION for dsptdr. Array, size at least $\max(1, n(n+1)/2)$. Contains either upper or lower triangle of A (as specified by <i>uplo</i>) in the packed form described in Matrix Storage Schemes .

Output Parameters

<i>ap</i>	Overwritten by the tridiagonal matrix T and details of the orthogonal matrix Q , as specified by <i>uplo</i> .
<i>d, e, tau</i>	REAL for ssptdr DOUBLE PRECISION for dsptdr. Arrays: <i>d</i> (*) contains the diagonal elements of the matrix T . The dimension of <i>d</i> must be at least $\max(1, n)$. <i>e</i> (*) contains the off-diagonal elements of T . The dimension of <i>e</i> must be at least $\max(1, n-1)$.

$\tau(*)$ Stores $(n-1)$ scalars that define elementary reflectors in decomposition of the matrix Q in a product of $n-1$ reflectors.

The dimension of τ must be at least $\max(1, n-1)$.

$info$

INTEGER.

If $info = 0$, the execution is successful.

If $info = -i$, the i -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `sptdr` interface are the following:

ap Holds the array A of size $(n*(n+1)/2)$.

τ Holds the vector with the number of elements $n-1$.

$uplo$ Must be 'U' or 'L'. The default value is 'U'.

Note that diagonal (d) and off-diagonal (e) elements of the matrix T are omitted because they are kept in the matrix A on exit.

Application Notes

The matrix Q is represented as a product of $n-1$ *elementary reflectors*, as follows :

- If $uplo = 'U'$, $Q = H(n-1) \dots H(2)H(1)$

Each $H(i)$ has the form

$$H(i) = I - \tau v v^T$$

where τ is a real scalar and v is a real vector with $v(i+1:n) = 0$ and $v(i) = 1$.

On exit, τ is stored in $\tau(i)$, and $v(1:i-1)$ is stored in AP , overwriting $A(1:i-1, i+1)$.

- If $uplo = 'L'$, $Q = H(1)H(2) \dots H(n-1)$

Each $H(i)$ has the form

$$H(i) = I - \tau v v^T$$

where τ is a real scalar and v is a real vector with $v(1:i) = 0$ and $v(i+1) = 1$.

On exit, τ is stored in $\tau(i)$, and $v(i+2:n)$ is stored in AP , overwriting $A(i+2:n, i)$.

The computed matrix T is exactly similar to a matrix $A+E$, where $\|E\|_2 = c(n) * \epsilon * \|A\|_2$, $c(n)$ is a modestly increasing function of n , and ϵ is the machine precision. The approximate number of floating-point operations is $(4/3) n^3$.

After calling this routine, you can call the following:

`opgtr` to form the computed matrix Q explicitly

`opmtr` to multiply a real matrix by Q .

The complex counterpart of this routine is [hptrd](#).

?opgtr

Generates the real orthogonal matrix Q determined by ?sptrd.

Syntax

```
call soggtr(uplo, n, ap, tau, q, ldq, work, info)
call doggtr(uplo, n, ap, tau, q, ldq, work, info)
call oggtr(ap, tau, q [,uplo] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine explicitly generates the n -by- n orthogonal matrix Q formed by [sptrd](#) when reducing a packed real symmetric matrix A to tridiagonal form: $A = Q^*T^*Q^T$. Use this routine after a call to ?sptrd.

Input Parameters

<i>uplo</i>	CHARACTER*1. Must be 'U' or 'L'. Use the same <i>uplo</i> as supplied to ?sptrd.
<i>n</i>	INTEGER. The order of the matrix Q ($n \geq 0$).
<i>ap, tau</i>	REAL for soggtr DOUBLE PRECISION for doggtr. Arrays <i>ap</i> and <i>tau</i> , as returned by ?sptrd. The size of <i>ap</i> must be at least $\max(1, n(n+1)/2)$. The size of <i>tau</i> must be at least $\max(1, n-1)$.
<i>ldq</i>	INTEGER. The leading dimension of the output array <i>q</i> ; at least $\max(1, n)$.
<i>work</i>	REAL for soggtr DOUBLE PRECISION for doggtr. Workspace array, size at least $\max(1, n-1)$.

Output Parameters

<i>q</i>	REAL for soggtr DOUBLE PRECISION for doggtr. Array, size (<i>ldq</i> ,*) . Contains the computed matrix Q . The second dimension of <i>q</i> must be at least $\max(1, n)$.
<i>info</i>	INTEGER. If <i>info</i> = 0, the execution is successful. If <i>info</i> = - <i>i</i> , the <i>i</i> -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `opgtr` interface are the following:

<i>ap</i>	Holds the array <i>A</i> of size $(n*(n+1)/2)$.
<i>tau</i>	Holds the vector with the number of elements $n - 1$.
<i>q</i>	Holds the matrix <i>Q</i> of size (n,n) .
<i>uplo</i>	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The computed matrix *Q* differs from an exactly orthogonal matrix by a matrix *E* such that $\|E\|_2 = O(\varepsilon)$, where ε is the machine precision.

The approximate number of floating-point operations is $(4/3)n^3$.

The complex counterpart of this routine is [upgtr](#).

?opmtr

*Multiplies a real matrix by the real orthogonal matrix *Q* determined by ?sptrd.*

Syntax

```
call sopmtr(side, uplo, trans, m, n, ap, tau, c, ldc, work, info)
call dopmtr(side, uplo, trans, m, n, ap, tau, c, ldc, work, info)
call opmtr(ap, tau, c [,side] [,uplo] [,trans] [,info])
```

Include Files

?upmtr

*Multiplies a complex matrix by the unitary matrix *Q* determined by ?hptrd.*

Syntax

```
call cupmtr(side, uplo, trans, m, n, ap, tau, c, ldc, work, info)
call zupmtr(side, uplo, trans, m, n, ap, tau, c, ldc, work, info)
call upmtr(ap, tau, c [,side] [,uplo] [,trans] [,info])
```

Include Files

- `mkl.fi, lapack.f90`

Description

The routine multiplies a complex matrix *C* by *Q* or Q^H , where *Q* is the unitary matrix formed by [hptrd](#) when reducing a packed complex Hermitian matrix *A* to tridiagonal form: $A = Q^H T Q$. Use this routine after a call to `?hptrd`.

Depending on the parameters *side* and *trans*, the routine can form one of the matrix products $Q^H C$, $C Q^H$, $C Q$, or $Q C$ (overwriting the result on *C*).

Input Parameters

In the descriptions below, *r* denotes the order of *Q*:

If *side* = 'L', $r = m$; if *side* = 'R', $r = n$.

<i>side</i>	CHARACTER*1. Must be either 'L' or 'R'. If <i>side</i> = 'L', Q or Q^H is applied to <i>C</i> from the left. If <i>side</i> = 'R', Q or Q^H is applied to <i>C</i> from the right.
<i>uplo</i>	CHARACTER*1. Must be 'U' or 'L'.

	Use the same <i>uplo</i> as supplied to ?hptrd.
<i>trans</i>	CHARACTER*1. Must be either 'N' or 'T'. If <i>trans</i> = 'N', the routine multiplies <i>C</i> by <i>Q</i> . If <i>trans</i> = 'T', the routine multiplies <i>C</i> by Q^H .
<i>m</i>	INTEGER. The number of rows in the matrix <i>C</i> ($m \geq 0$).
<i>n</i>	INTEGER. The number of columns in <i>C</i> ($n \geq 0$).
<i>ap</i> , <i>tau</i> , <i>c</i> ,	COMPLEX for cupmtr DOUBLE COMPLEX for zupmtr. <i>ap</i> and <i>tau</i> are the arrays returned by ?hptrd. The size of <i>ap</i> must be at least $\max(1, r(r+1)/2)$. The size of <i>tau</i> must be at least $\max(1, r-1)$. <i>c(ldc,*)</i> contains the matrix <i>C</i> . The second dimension of <i>c</i> must be at least $\max(1, n)$ <i>work(*)</i> is a workspace array. The dimension of <i>work</i> must be at least $\max(1, n)$ if <i>side</i> = 'L'; $\max(1, m)$ if <i>side</i> = 'R'.
<i>ldc</i>	INTEGER. The leading dimension of <i>c</i> ; $ldc \geq \max(1, m)$.

Output Parameters

<i>c</i>	Overwritten by the product $Q^H C$, $Q^H C$, $C^H Q$, or $C^H Q^H$ (as specified by <i>side</i> and <i>trans</i>).
<i>info</i>	INTEGER. If <i>info</i> = 0, the execution is successful. If <i>info</i> = - <i>i</i> , the <i>i</i> -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `upmtr` interface are the following:

<i>ap</i>	Holds the array <i>A</i> of size $r*(r+1)/2$, where $r = m$ if <i>side</i> = 'L'. $r = n$ if <i>side</i> = 'R'.
<i>tau</i>	Holds the vector with the number of elements $n - 1$.
<i>c</i>	Holds the matrix <i>C</i> of size (m, n) .

<i>side</i>	Must be 'L' or 'R'. The default value is 'L'.
<i>uplo</i>	Must be 'U' or 'L'. The default value is 'U'.
<i>trans</i>	Must be 'N' or 'C'. The default value is 'N'.

Application Notes

The computed product differs from the exact product by a matrix E such that $\|E\|_2 = O(\epsilon) * \|C\|_2$, where ϵ is the machine precision.

The total number of floating-point operations is approximately $8*m^2*n$ if *side* = 'L' or $8*n^2*m$ if *side* = 'R'.

The real counterpart of this routine is [opmtr](#).

?sbtrd

Reduces a real symmetric band matrix to tridiagonal form.

Syntax

```
call ssbtrd(vect, uplo, n, kd, ab, ldab, d, e, q, ldq, work, info)
call dsbtrd(vect, uplo, n, kd, ab, ldab, d, e, q, ldq, work, info)
call sbtrd(ab[, q] [, vect] [, uplo] [, info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine reduces a real symmetric band matrix A to symmetric tridiagonal form T by an orthogonal similarity transformation: $A = Q * T * Q^T$. The orthogonal matrix Q is determined as a product of Givens rotations.

If required, the routine can also form the matrix Q explicitly.

Input Parameters

<i>vect</i>	CHARACTER*1. Must be 'V', 'N', or 'U'. If <i>vect</i> = 'V', the routine returns the explicit matrix Q . If <i>vect</i> = 'N', the routine does not return Q . If <i>vect</i> = 'U', the routine updates matrix X by forming $X * Q$.
<i>uplo</i>	CHARACTER*1. Must be 'U' or 'L'. If <i>uplo</i> = 'U', <i>ab</i> stores the upper triangular part of A . If <i>uplo</i> = 'L', <i>ab</i> stores the lower triangular part of A .
<i>n</i>	INTEGER. The order of the matrix A ($n \geq 0$).
<i>kd</i>	INTEGER. The number of super- or sub-diagonals in A ($kd \geq 0$).

<i>ab</i> , <i>q</i> , <i>work</i>	<p>REAL for <i>ssbtrd</i></p> <p>DOUBLE PRECISION for <i>dsbtrd</i>.</p> <p><i>ab</i>(<i>ldab</i>,*) is an array containing either upper or lower triangular part of the matrix <i>A</i> (as specified by <i>uplo</i>) in band storage format.</p> <p>The second dimension of <i>ab</i> must be at least $\max(1, n)$.</p> <p><i>q</i>(<i>ldq</i>,*) is an array.</p> <p>If <i>vect</i> = 'U', the <i>q</i> array must contain an <i>n</i>-by-<i>n</i> matrix <i>X</i>.</p> <p>If <i>vect</i> = 'N' or 'V', the <i>q</i> parameter need not be set.</p> <p>The second dimension of <i>q</i> must be at least $\max(1, n)$.</p> <p><i>work</i>(*) is a workspace array.</p> <p>The dimension of <i>work</i> must be at least $\max(1, n)$.</p>
<i>ldab</i>	INTEGER. The leading dimension of <i>ab</i> ; at least $kd+1$.
<i>ldq</i>	<p>INTEGER. The leading dimension of <i>q</i>. Constraints:</p> <p>$ldq \geq \max(1, n)$ if <i>vect</i> = 'V' or 'U';</p> <p>$ldq \geq 1$ if <i>vect</i> = 'N'.</p>

Output Parameters

<i>ab</i>	<p>On exit, the diagonal elements of the array <i>ab</i> are overwritten by the diagonal elements of the tridiagonal matrix <i>T</i>. If $kd > 0$, the elements on the first superdiagonal (if <i>uplo</i> = 'U') or the first subdiagonal (if <i>uplo</i> = 'L') are overwritten by the off-diagonal elements of <i>T</i>. The rest of <i>ab</i> is overwritten by values generated during the reduction.</p>
<i>d</i> , <i>e</i> , <i>q</i>	<p>REAL for <i>ssbtrd</i></p> <p>DOUBLE PRECISION for <i>dsbtrd</i>.</p> <p>Arrays:</p> <p><i>d</i>(*) contains the diagonal elements of the matrix <i>T</i>.</p> <p>The size of <i>d</i> must be at least $\max(1, n)$.</p> <p><i>e</i>(*) contains the off-diagonal elements of <i>T</i>.</p> <p>The size of <i>e</i> must be at least $\max(1, n-1)$.</p> <p><i>q</i>(<i>ldq</i>,*) is not referenced if <i>vect</i> = 'N'.</p> <p>If <i>vect</i> = 'V', <i>q</i> contains the <i>n</i>-by-<i>n</i> matrix <i>Q</i>.</p> <p>If <i>vect</i> = 'U', <i>q</i> contains the product $X^* Q$.</p> <p>The second dimension of <i>q</i> must be:</p> <p>at least $\max(1, n)$ if <i>vect</i> = 'V';</p> <p>at least 1 if <i>vect</i> = 'N'.</p>
<i>info</i>	<p>INTEGER.</p> <p>If <i>info</i> = 0, the execution is successful.</p>

If $info = -i$, the i -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `sbtrd` interface are the following:

<code>ab</code>	Holds the array A of size $(kd+1, n)$.
<code>q</code>	Holds the matrix Q of size (n, n) .
<code>uplo</code>	Must be 'U' or 'L'. The default value is 'U'.
<code>vect</code>	If omitted, this argument is restored based on the presence of argument q as follows: $vect = 'V'$, if q is present, $vect = 'N'$, if q is omitted. If present, $vect$ must be equal to 'V' or 'U' and the argument q must also be present. Note that there will be an error condition if $vect$ is present and q omitted.

Note that diagonal (d) and off-diagonal (e) elements of the matrix T are omitted because they are kept in the matrix A on exit.

Application Notes

The computed matrix T is exactly similar to a matrix $A+E$, where $\|E\|_2 = c(n) * \epsilon * \|A\|_2$, $c(n)$ is a modestly increasing function of n , and ϵ is the machine precision. The computed matrix Q differs from an exactly orthogonal matrix by a matrix E such that $\|E\|_2 = O(\epsilon)$.

The total number of floating-point operations is approximately $6n^2 * kd$ if $vect = 'N'$, with $3n^3 * (kd-1) / kd$ additional operations if $vect = 'V'$.

The complex counterpart of this routine is [hbtrd](#).

?hbtrd

Reduces a complex Hermitian band matrix to tridiagonal form.

Syntax

```
call chbtrd(vect, uplo, n, kd, ab, ldab, d, e, q, ldq, work, info)
call zhbtrd(vect, uplo, n, kd, ab, ldab, d, e, q, ldq, work, info)
call hbtrd(ab [, q] [, vect] [, uplo] [, info])
```

Include Files

- `mkl.fi`, `lapack.f90`

Description

The routine reduces a complex Hermitian band matrix A to symmetric tridiagonal form T by a unitary similarity transformation: $A = Q * T * Q^H$. The unitary matrix Q is determined as a product of Givens rotations.

If required, the routine can also form the matrix Q explicitly.

Input Parameters

<i>vect</i>	<p>CHARACTER*1. Must be 'V', 'N', or 'U'.</p> <p>If <i>vect</i> = 'V', the routine returns the explicit matrix <i>Q</i>.</p> <p>If <i>vect</i> = 'N', the routine does not return <i>Q</i>.</p> <p>If <i>vect</i> = 'U', the routine updates matrix <i>X</i> by forming Q^*X.</p>
<i>uplo</i>	<p>CHARACTER*1. Must be 'U' or 'L'.</p> <p>If <i>uplo</i> = 'U', <i>ab</i> stores the upper triangular part of <i>A</i>.</p> <p>If <i>uplo</i> = 'L', <i>ab</i> stores the lower triangular part of <i>A</i>.</p>
<i>n</i>	INTEGER. The order of the matrix <i>A</i> ($n \geq 0$).
<i>kd</i>	<p>INTEGER. The number of super- or sub-diagonals in <i>A</i></p> <p>($kd \geq 0$).</p>
<i>ab, work</i>	<p>COMPLEX for chbtrd</p> <p>DOUBLE COMPLEX for zhbtrd.</p> <p><i>ab</i>(<i>ldab</i>,*) is an array containing either upper or lower triangular part of the matrix <i>A</i> (as specified by <i>uplo</i>) in band storage format.</p> <p>The second dimension of <i>ab</i> must be at least $\max(1, n)$.</p> <p><i>work</i>(*) is a workspace array.</p> <p>The dimension of <i>work</i> must be at least $\max(1, n)$.</p>
<i>q</i>	<p>COMPLEX for chbtrd</p> <p>DOUBLE COMPLEX for zhbtrd.</p> <p><i>q</i>(<i>ldq</i>,*) is an array.</p> <p>If <i>vect</i> = 'U', the <i>q</i> array must contain an <i>n</i>-by-<i>n</i> matrix <i>X</i>.</p> <p>If <i>vect</i> = 'N' or 'V', the <i>q</i> parameter need not be set.'</p>
<i>ldab</i>	INTEGER. The leading dimension of <i>ab</i> ; at least $kd+1$.
<i>ldq</i>	<p>INTEGER. The leading dimension of <i>q</i>. Constraints:</p> <p>$ldq \geq \max(1, n)$ if <i>vect</i> = 'V' or 'U';</p> <p>$ldq \geq 1$ if <i>vect</i> = 'N'.</p>

Output Parameters

<i>ab</i>	<p>On exit, the diagonal elements of the array <i>ab</i> are overwritten by the diagonal elements of the tridiagonal matrix <i>T</i>. If $kd > 0$, the elements on the first superdiagonal (if <i>uplo</i> = 'U') or the first subdiagonal (if <i>uplo</i> = 'L') are overwritten by the off-diagonal elements of <i>T</i>. The rest of <i>ab</i> is overwritten by values generated during the reduction.</p>
<i>d, e</i>	<p>REAL for chbtrd</p> <p>DOUBLE PRECISION for zhbtrd.</p>

Arrays:

$d(*)$ contains the diagonal elements of the matrix T .

The dimension of d must be at least $\max(1, n)$.

$e(*)$ contains the off-diagonal elements of T .

The dimension of e must be at least $\max(1, n-1)$.

q

If $vect = 'N'$, q is not referenced.

If $vect = 'V'$, q contains the n -by- n matrix Q .

If $vect = 'U'$, q contains the product $X^* Q$.

The second dimension of q must be:

at least $\max(1, n)$ if $vect = 'V'$;

at least 1 if $vect = 'N'$.

$info$

INTEGER.

If $info = 0$, the execution is successful.

If $info = -i$, the i th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `hbtrd` interface are the following:

ab

Holds the array A of size $(kd+1, n)$.

q

Holds the matrix Q of size (n, n) .

$uplo$

Must be `'U'` or `'L'`. The default value is `'U'`.

$vect$

If omitted, this argument is restored based on the presence of argument q as follows: $vect = 'V'$, if q is present, $vect = 'N'$, if q is omitted.

If present, $vect$ must be equal to `'V'` or `'U'` and the argument q must also be present. Note that there will be an error condition if $vect$ is present and q omitted.

Note that diagonal (d) and off-diagonal (e) elements of the matrix T are omitted because they are kept in the matrix A on exit.

Application Notes

The computed matrix T is exactly similar to a matrix $A + E$, where $\|E\|_2 = c(n) * \epsilon * \|A\|_2$, $c(n)$ is a modestly increasing function of n , and ϵ is the machine precision. The computed matrix Q differs from an exactly unitary matrix by a matrix E such that $\|E\|_2 = O(\epsilon)$.

The total number of floating-point operations is approximately $20n^2 * kd$ if $vect = 'N'$, with $10n^3 * (kd-1) / kd$ additional operations if $vect = 'V'$.

The real counterpart of this routine is [sbtrd](#).

?sterf

Computes all eigenvalues of a real symmetric tridiagonal matrix using QR algorithm.

Syntax

```
call ssterf(n, d, e, info)
call dsterf(n, d, e, info)
call sterf(d, e [,info])
```

Include Files

- `mkl.fi`, `lapack.f90`

Description

The routine computes all the eigenvalues of a real symmetric tridiagonal matrix T (which can be obtained by reducing a symmetric or Hermitian matrix to tridiagonal form). The routine uses a square-root-free variant of the QR algorithm.

If you need not only the eigenvalues but also the eigenvectors, call [steqr](#).

Input Parameters

n INTEGER. The order of the matrix T ($n \geq 0$).

d, e REAL for `ssterf`
DOUBLE PRECISION for `dsterf`.

Arrays:

$d(*)$ contains the diagonal elements of T .
The dimension of d must be at least $\max(1, n)$.

$e(*)$ contains the off-diagonal elements of T .
The dimension of e must be at least $\max(1, n-1)$.

Output Parameters

d The n eigenvalues in ascending order, unless $info > 0$.
See also *info*.

e On exit, the array is overwritten; see *info*.

$info$ INTEGER.

If $info = 0$, the execution is successful.

If $info = i$, the algorithm failed to find all the eigenvalues after $30n$ iterations:

i off-diagonal elements have not converged to zero. On exit, d and e contain, respectively, the diagonal and off-diagonal elements of a tridiagonal matrix orthogonally similar to T .

If $info = -i$, the i -th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [Fortran 95 Interface Conventions](#).

Specific details for the routine `sterf` interface are the following:

d	Holds the vector of length n .
e	Holds the vector of length $(n-1)$.

Application Notes

The computed eigenvalues and eigenvectors are exact for a matrix $T+E$ such that $\|E\|_2 = O(\varepsilon) * \|T\|_2$, where ε is the machine precision.

If λ_i is an exact eigenvalue, and m_i is the corresponding computed value, then

$$|\mu_i - \lambda_i| \leq c(n) * \varepsilon * \|T\|_2$$

where $c(n)$ is a modestly increasing function of n .

The total number of floating-point operations depends on how rapidly the algorithm converges. Typically, it is about $14n^2$.

?steqr

Computes all eigenvalues and eigenvectors of a symmetric or Hermitian matrix reduced to tridiagonal form (QR algorithm).

Syntax

```
call ssteqr(compz, n, d, e, z, ldz, work, info)
call dsteqr(compz, n, d, e, z, ldz, work, info)
call csteqr(compz, n, d, e, z, ldz, work, info)
call zsteqr(compz, n, d, e, z, ldz, work, info)
call rsteqr(d, e [,z] [,compz] [,info])
call steqr(d, e [,z] [,compz] [,info])
```

Include Files

- `mk1.fi`, `lapack.f90`

Description

The routine computes all the eigenvalues and (optionally) all the eigenvectors of a real symmetric tridiagonal matrix T . In other words, the routine can compute the spectral factorization: $T = Z * \Lambda * Z^T$. Here Λ is a diagonal matrix whose diagonal elements are the eigenvalues λ_i ; Z is an orthogonal matrix whose columns are eigenvectors. Thus,

$$T * z_i = \lambda_i * z_i \text{ for } i = 1, 2, \dots, n.$$

The routine normalizes the eigenvectors so that $\|z_i\|_2 = 1$.

You can also use the routine for computing the eigenvalues and eigenvectors of an arbitrary real symmetric (or complex Hermitian) matrix A reduced to tridiagonal form T : $A = Q * T * Q^H$. In this case, the spectral factorization is as follows: $A = Q * T * Q^H = (Q * Z) * \Lambda * (Q * Z)^H$. Before calling `?steqr`, you must reduce A to tridiagonal form and generate the explicit matrix Q by calling the following routines:

	for real matrices:	for complex matrices:
full storage	?sytrd, ?orgtr	?hetrd, ?ungtr
packed storage	?sptrd, ?opgtr	?hptrd, ?upgtr
band storage	?sbtrd(<i>vect</i> ='V')	?hbtrd(<i>vect</i> ='V')

If you need eigenvalues only, it's more efficient to call [sterf](#). If T is positive-definite, [pteqr](#) can compute small eigenvalues more accurately than [steqr](#).

To solve the problem by a single call, use one of the divide and conquer routines [stevd](#), [syevd](#), [spevd](#), or [sbevd](#) for real symmetric matrices or [heevd](#), [hpevd](#), or [hbevd](#) for complex Hermitian matrices.

Input Parameters

<i>compz</i>	<p>CHARACTER*1. Must be 'N' or 'I' or 'V'.</p> <p>If <i>compz</i> = 'N', the routine computes eigenvalues only.</p> <p>If <i>compz</i> = 'I', the routine computes the eigenvalues and eigenvectors of the tridiagonal matrix T.</p> <p>If <i>compz</i> = 'V', the routine computes the eigenvalues and eigenvectors of the original symmetric matrix. On entry, z must contain the orthogonal matrix used to reduce the original matrix to tridiagonal form.</p>
<i>n</i>	<p>INTEGER. The order of the matrix T ($n \geq 0$).</p>
<i>d</i> , <i>e</i> , <i>work</i>	<p>REAL for single-precision flavors</p> <p>DOUBLE PRECISION for double-precision flavors.</p> <p>Arrays:</p> <p>$d(*)$ contains the diagonal elements of T.</p> <p>The size of d must be at least $\max(1, n)$.</p> <p>$e(*)$ contains the off-diagonal elements of T.</p> <p>The size of e must be at least $\max(1, n-1)$.</p> <p>$work(*)$ is a workspace array.</p> <p>The size of $work$ must be:</p> <p>at least 1 if <i>compz</i> = 'N';</p> <p>at least $\max(1, 2*n-2)$ if <i>compz</i> = 'V' or 'I'.</p>
<i>z</i>	<p>REAL for ssteqr</p> <p>DOUBLE PRECISION for dsteqr</p> <p>COMPLEX for csteqr</p> <p>DOUBLE COMPLEX for zsteqr.</p> <p>Array, size ($ldz, *$).</p> <p>If <i>compz</i> = 'N' or 'I', z need not be set.</p> <p>If <i>vect</i> = 'V', z must contain the orthogonal matrix used in the reduction to tridiagonal form.</p> <p>The second dimension of z must be:</p>

at least 1 if `compz = 'N'`;
 at least $\max(1, n)$ if `compz = 'V' or 'I'`.
`work (/work)` is a workspace array.

`ldz` INTEGER. The leading dimension of `z`. Constraints:
`ldz` ≥ 1 if `compz = 'N'`;
`ldz` $\geq \max(1, n)$ if `compz = 'V' or 'I'`.

Output Parameters

`d` The n eigenvalues in ascending order, unless `info > 0`.
 See also `info`.

`e` On exit, the array is overwritten; see `info`.

`z` If `info = 0`, contains the n -by- n matrix the columns of which are orthonormal eigenvectors (the i -th column corresponds to the i -th eigenvalue).

`info` INTEGER.
 If `info = 0`, the execution is successful.
 If `info = i`, the algorithm failed to find all the eigenvalues after $30n$ iterations: i off-diagonal elements have not converged to zero. On exit, `d` and `e` contain, respectively, the diagonal and off-diagonal elements of a tridiagonal matrix orthogonally similar to T .
 If `info = -i`, the i -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `steqr` interface are the following:

`d` Holds the vector of length n .

`e` Holds the vector of length $(n-1)$.

`z` Holds the matrix Z of size (n,n) .

`compz` If omitted, this argument is restored based on the presence of argument `z` as follows:
`compz = 'I'`, if `z` is present,
`compz = 'N'`, if `z` is omitted.
 If present, `compz` must be equal to `'I'` or `'V'` and the argument `z` must also be present. Note that there will be an error condition if `compz` is present and `z` omitted.

Note that two variants of Fortran 95 interface for `steqr` routine are needed because of an ambiguous choice between real and complex cases appear when `z` is omitted. Thus, the name `rsteqr` is used in real cases (single or double precision), and the name `steqr` is used in complex cases (single or double precision).

Application Notes

The computed eigenvalues and eigenvectors are exact for a matrix $T+E$ such that $\|E\|_2 = O(\varepsilon) * \|T\|_2$, where ε is the machine precision.

If λ_i is an exact eigenvalue, and μ_i is the corresponding computed value, then

$$|\mu_i - \lambda_i| \leq c(n) * \varepsilon * \|T\|_2$$

where $c(n)$ is a modestly increasing function of n .

If z_i is the corresponding exact eigenvector, and w_i is the corresponding computed vector, then the angle $\theta(z_i, w_i)$ between them is bounded as follows:

$$\theta(z_i, w_i) \leq c(n) * \varepsilon * \|T\|_2 / \min_{i \neq j} |\lambda_i - \lambda_j|.$$

The total number of floating-point operations depends on how rapidly the algorithm converges. Typically, it is about

$24n^2$ if `compz = 'N'`;

$7n^3$ (for complex flavors, $14n^3$) if `compz = 'V' or 'I'`.

?stemr

Computes selected eigenvalues and eigenvectors of a real symmetric tridiagonal matrix.

Syntax

```
call sstemr(jobz, range, n, d, e, vl, vu, il, iu, m, w, z, ldz, nzc, isuppz, tryrac,
work, lwork, iwork, liwork, info)
```

```
call dstemr(jobz, range, n, d, e, vl, vu, il, iu, m, w, z, ldz, nzc, isuppz, tryrac,
work, lwork, iwork, liwork, info)
```

```
call cstemr(jobz, range, n, d, e, vl, vu, il, iu, m, w, z, ldz, nzc, isuppz, tryrac,
work, lwork, iwork, liwork, info)
```

```
call zstemr(jobz, range, n, d, e, vl, vu, il, iu, m, w, z, ldz, nzc, isuppz, tryrac,
work, lwork, iwork, liwork, info)
```

Include Files

- `mk1.fi`, `lapack.f90`

Description

The routine computes selected eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix T . Any such unreduced matrix has a well defined set of pairwise different real eigenvalues, the corresponding real eigenvectors are pairwise orthogonal.

The spectrum may be computed either completely or partially by specifying either an interval $(vl, vu]$ or a range of indices `il:iu` for the desired eigenvalues.

Depending on the number of desired eigenvalues, these are computed either by bisection or the *dqds* algorithm. Numerically orthogonal eigenvectors are computed by the use of various suitable $L^*D^*L^T$ factorizations near clusters of close eigenvalues (referred to as RRRs, Relatively Robust Representations). An informal sketch of the algorithm follows.

For each unreduced block (submatrix) of T ,

- a.** Compute $T - \text{sigma} * I = L^*D^*L^T$, so that L and D define all the wanted eigenvalues to high relative accuracy. This means that small relative changes in the entries of L and D cause only small relative changes in the eigenvalues and eigenvectors. The standard (unfactored) representation of the tridiagonal matrix T does not have this property in general.
- b.** Compute the eigenvalues to suitable accuracy. If the eigenvectors are desired, the algorithm attains full accuracy of the computed eigenvalues only right before the corresponding vectors have to be computed, see steps c and d.
- c.** For each cluster of close eigenvalues, select a new shift close to the cluster, find a new factorization, and refine the shifted eigenvalues to suitable accuracy.
- d.** For each eigenvalue with a large enough relative separation compute the corresponding eigenvector by forming a rank revealing twisted factorization. Go back to step c for any clusters that remain.

For more details, see: [Dhillon04], [Dhillon04-02], [Dhillon97]

Input Parameters

<i>jobz</i>	<p>CHARACTER*1. Must be 'N' or 'V'.</p> <p>If <i>jobz</i> = 'N', then only eigenvalues are computed.</p> <p>If <i>jobz</i> = 'V', then eigenvalues and eigenvectors are computed.</p>
<i>range</i>	<p>CHARACTER*1. Must be 'A' or 'V' or 'I'.</p> <p>If <i>range</i> = 'A', the routine computes all eigenvalues.</p> <p>If <i>range</i> = 'V', the routine computes all eigenvalues in the half-open interval: (<i>vl</i>, <i>vu</i>].</p> <p>If <i>range</i> = 'I', the routine computes eigenvalues with indices <i>il</i> to <i>iu</i>.</p>
<i>n</i>	<p>INTEGER. The order of the matrix T ($n \geq 0$).</p>
<i>d</i>	<p>REAL for single precision flavors</p> <p>DOUBLE PRECISION for double precision flavors.</p> <p>Array, size (<i>n</i>).</p> <p>Contains <i>n</i> diagonal elements of the tridiagonal matrix T.</p>
<i>e</i>	<p>REAL for single precision flavors</p> <p>DOUBLE PRECISION for double precision flavors.</p> <p>Array, size <i>n</i>.</p> <p>Contains (<i>n</i>-1) off-diagonal elements of the tridiagonal matrix T in elements 1 to <i>n</i>-1 of <i>e</i>. <i>e</i>(<i>n</i>) need not be set on input, but is used internally as workspace.</p>
<i>vl</i> , <i>vu</i>	<p>REAL for single precision flavors</p> <p>DOUBLE PRECISION for double precision flavors.</p>

If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues. Constraint: $vl < vu$.

If *range* = 'A' or 'I', *vl* and *vu* are not referenced.

il, iu

INTEGER.

If *range* = 'I', the indices in ascending order of the smallest and largest eigenvalues to be returned.

Constraint: $1 \leq il \leq iu \leq n$, if $n > 0$.

If *range* = 'A' or 'V', *il* and *iu* are not referenced.

ldz

INTEGER. The leading dimension of the output array *z*.

if *jobz* = 'V', then $ldz \geq \max(1, n)$;

$ldz \geq 1$ otherwise.

nzc

INTEGER. The number of eigenvectors to be held in the array *z*.

If *range* = 'A', then $nzc \geq \max(1, n)$;

If *range* = 'V', then *nzc* is greater than or equal to the number of eigenvalues in the half-open interval: $(vl, vu]$.

If *range* = 'I', then $nzc \geq iu - il + 1$.

If *nzc* = -1, then a workspace query is assumed; the routine calculates the number of columns of the array *z* that are needed to hold the eigenvectors.

This value is returned as the first entry of the array *z*, and no error message related to *nzc* is issued by the routine *xerbla*.

tryrac

LOGICAL.

If *tryrac* = .TRUE. is true, it indicates that the code should check whether the tridiagonal matrix defines its eigenvalues to high relative accuracy. If so, the code uses relative-accuracy preserving algorithms that might be (a bit) slower depending on the matrix. If the matrix does not define its eigenvalues to high relative accuracy, the code can use possibly faster algorithms.

If *tryrac* = .FALSE. is not true, the code is not required to guarantee relatively accurate eigenvalues and can use the fastest possible techniques.

work

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Workspace array, size (*lwork*).

lwork

INTEGER.

The dimension of the array *work*,

$lwork \geq \max(1, 18 * n)$.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by *xerbla*.

iwork INTEGER.
Workspace array, size (*liwork*).

liwork INTEGER.
The dimension of the array *iwork*.
 $lwork \geq \max(1, 10*n)$ if the eigenvectors are desired, and $lwork \geq \max(1, 8*n)$ if only the eigenvalues are to be computed.
If *liwork*=-1, then a workspace query is assumed; the routine only calculates the optimal size of the *iwork* array, returns this value as the first entry of the *iwork* array, and no error message related to *liwork* is issued by xerbla.

Output Parameters

d On exit, the array *d* is overwritten.

e On exit, the array *e* is overwritten.

m INTEGER.
The total number of eigenvalues found, $0 \leq m \leq n$.
If *range* = 'A', then $m=n$, and if *range* = 'I', then $m=i_u-i_l+1$.

w REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, size (*n*).
The first *m* elements contain the selected eigenvalues in ascending order.

z REAL for sstemr
DOUBLE PRECISION for dstemr
COMPLEX for cstemr
DOUBLE COMPLEX for zstemr.
Array *z*(*ldz*,*), the second dimension of *z* must be at least $\max(1, m)$.
If *jobz* = 'V', and *info* = 0, then the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix *T* corresponding to the selected eigenvalues, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*).
If *jobz* = 'N', then *z* is not referenced.
Note: you must ensure that at least $\max(1, m)$ columns are supplied in the array *z*; if *range* = 'V', the exact value of *m* is not known in advance and can be computed with a workspace query by setting *nzc*=-1, see description of the parameter *nzc*.

isuppz INTEGER.
Array, size ($2*\max(1, m)$).

The support of the eigenvectors in *z*, that is the indices indicating the nonzero elements in *z*. The *i*-th computed eigenvector is nonzero only in elements *isuppz*(2*i-1) through *isuppz*(2*i). This is relevant in the case when the matrix is split. *isuppz* is only accessed when *jobz* = 'V' and *n*>0.

<i>tryrac</i>	On exit, TRUE. <i>tryrac</i> is set to .FALSE. if the matrix does not define its eigenvalues to high relative accuracy.
<i>work</i> (1)	On exit, if <i>info</i> = 0, then <i>work</i> (1) returns the optimal (and minimal) size of <i>lwork</i> .
<i>iwork</i> (1)	On exit, if <i>info</i> = 0, then <i>iwork</i> (1) returns the optimal size of <i>liwork</i> .
<i>info</i>	INTEGER. If = 0, the execution is successful. If <i>info</i> = -i, the i-th parameter had an illegal value. If <i>info</i> = 1, internal error in ?larre occurred, if <i>info</i> = 2, internal error in ?larv occurred.

?stedc

Computes all eigenvalues and eigenvectors of a symmetric tridiagonal matrix using the divide and conquer method.

Syntax

```
call sstedc(compz, n, d, e, z, ldz, work, lwork, iwork, liwork, info)
call dstedc(compz, n, d, e, z, ldz, work, lwork, iwork, liwork, info)
call cstedc(compz, n, d, e, z, ldz, work, lwork, rwork, lrwork, iwork, liwork, info)
call zstedc(compz, n, d, e, z, ldz, work, lwork, rwork, lrwork, iwork, liwork, info)
call rstedc(d, e [,z] [,compz] [,info])
call stedc(d, e [,z] [,compz] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes all the eigenvalues and (optionally) all the eigenvectors of a symmetric tridiagonal matrix using the divide and conquer method. The eigenvectors of a full or band real symmetric or complex Hermitian matrix can also be found if [sytrd/hetrd](#) or [sptdr/hptrd](#) or [sbtrd/hbtrd](#) has been used to reduce this matrix to tridiagonal form.

See also [laed0](#), [laed1](#), [laed2](#), [laed3](#), [laed4](#), [laed5](#), [laed6](#), [laed7](#), [laed8](#), [laed9](#), and [laeda](#) used by this function.

Input Parameters

<i>compz</i>	CHARACTER*1. Must be 'N' or 'I' or 'V'. If <i>compz</i> = 'N', the routine computes eigenvalues only.
--------------	--

If `compz = 'I'`, the routine computes the eigenvalues and eigenvectors of the tridiagonal matrix.

If `compz = 'V'`, the routine computes the eigenvalues and eigenvectors of original symmetric/Hermitian matrix. On entry, the array `z` must contain the orthogonal/unitary matrix used to reduce the original matrix to tridiagonal form.

`n` INTEGER. The order of the symmetric tridiagonal matrix ($n \geq 0$).

`d, e, rwork` REAL for single-precision flavors

DOUBLE PRECISION for double-precision flavors.

Arrays:

`d(*)` contains the diagonal elements of the tridiagonal matrix.

The dimension of `d` must be at least $\max(1, n)$.

`e(*)` contains the subdiagonal elements of the tridiagonal matrix.

The dimension of `e` must be at least $\max(1, n-1)$.

`rwork` is a workspace array, its dimension $\max(1, lrwork)$.

`z, work` REAL for `sstedc`

DOUBLE PRECISION for `dstedc`

COMPLEX for `csstedc`

DOUBLE COMPLEX for `zsstedc`.

Arrays: `z(ldz, *)`, `work(*)`.

If `compz = 'V'`, then, on entry, `z` must contain the orthogonal/unitary matrix used to reduce the original matrix to tridiagonal form.

The second dimension of `z` must be at least $\max(1, n)$.

`work` is a workspace array, its dimension $\max(1, lwork)$.

`ldz` INTEGER. The leading dimension of `z`. Constraints:

$ldz \geq 1$ if `compz = 'N'`;

$ldz \geq \max(1, n)$ if `compz = 'V' or 'I'`.

`lwork` INTEGER. The dimension of the array `work`.

For real functions `sstedc` and `dstedc`:

- If `compz = 'N'` or $n \leq 1$, `lwork` must be at least 1.
 - If `compz = 'V'` and $n > 1$, `lwork` must be at least $1 + 3*n + 2*n*\log_2(n) + 4*n^2$, where $\log_2(n)$ is the smallest integer k such that $2^k \geq n$.
 - If `compz = 'I'` and $n > 1$ then `lwork` must be at least $1 + 4*n + n^2$
- Note that for `compz = 'I' or 'V'` and if n is less than or equal to the minimum divide size, usually 25, then `lwork` need only be $\max(1, 2*(n-1))$.

For complex functions `csstedc` and `zsstedc`:

- If `compz = 'N' or 'I'`, or $n \leq 1$, `lwork` must be at least 1.

- If $compz = 'V'$ and $n > 1$, $lwork$ must be at least n^2 .

Note that for $compz = 'V'$, and if n is less than or equal to the minimum divide size, usually 25, then $lwork$ need only be 1.

If $lwork = -1$, then a workspace query is assumed; the routine only calculates the optimal size of the $work$, $rwork$ and $iwork$ arrays, returns these values as the first entries of the $work$, $rwork$ and $iwork$ arrays, and no error message related to $lwork$ or $lrwork$ or $liwork$ is issued by [xerbla](#). See *Application Notes* for the required value of $lwork$.

$lrwork$

INTEGER. The dimension of the array $rwork$ (used for complex flavors only).

If $compz = 'N'$, or $n \leq 1$, $lrwork$ must be at least 1.

If $compz = 'V'$ and $n > 1$, $lrwork$ must be at least $(1 + 3*n + 2*n*\log_2(n) + 4*n^2)$, where $\log_2(n)$ is the smallest integer k such that $2^k \geq n$.

If $compz = 'I'$ and $n > 1$, $lrwork$ must be at least $(1 + 4*n + 2*n^2)$.

Note that for $compz = 'V'$ or $'I'$, and if n is less than or equal to the minimum divide size, usually 25, then $lrwork$ need only be $\max(1, 2*(n-1))$.

If $lrwork = -1$, then a workspace query is assumed; the routine only calculates the optimal size of the $work$, $rwork$ and $iwork$ arrays, returns these values as the first entries of the $work$, $rwork$ and $iwork$ arrays, and no error message related to $lwork$ or $lrwork$ or $liwork$ is issued by [xerbla](#). See *Application Notes* for the required value of $lrwork$.

$iwork$

INTEGER. Workspace array, its dimension $\max(1, liwork)$.

$liwork$

INTEGER. The dimension of the array $iwork$.

If $compz = 'N'$, or $n \leq 1$, $liwork$ must be at least 1.

If $compz = 'V'$ and $n > 1$, $liwork$ must be at least $(6 + 6*n + 5*n*\log_2(n))$, where $\log_2(n)$ is the smallest integer k such that $2^k \geq n$.

If $compz = 'I'$ and $n > 1$, $liwork$ must be at least $(3 + 5*n)$.

Note that for $compz = 'V'$ or $'I'$, and if n is less than or equal to the minimum divide size, usually 25, then $liwork$ need only be 1.

If $liwork = -1$, then a workspace query is assumed; the routine only calculates the optimal size of the $work$, $rwork$ and $iwork$ arrays, returns these values as the first entries of the $work$, $rwork$ and $iwork$ arrays, and no error message related to $lwork$ or $lrwork$ or $liwork$ is issued by [xerbla](#). See *Application Notes* for the required value of $liwork$.

Output Parameters

d

The n eigenvalues in ascending order, unless $info \neq 0$.

See also *info*.

e

On exit, the array is overwritten; see *info*.

<i>z</i>	If <i>info</i> = 0, then if <i>compz</i> = 'V', <i>z</i> contains the orthonormal eigenvectors of the original symmetric/Hermitian matrix, and if <i>compz</i> = 'I', <i>z</i> contains the orthonormal eigenvectors of the symmetric tridiagonal matrix. If <i>compz</i> = 'N', <i>z</i> is not referenced.
<i>work</i> (1)	On exit, if <i>info</i> = 0, then <i>work</i> (1) returns the optimal <i>lwork</i> .
<i>rwork</i> (1)	On exit, if <i>info</i> = 0, then <i>rwork</i> (1) returns the optimal <i>lrwork</i> (for complex flavors only).
<i>iwork</i> (1)	On exit, if <i>info</i> = 0, then <i>iwork</i> (1) returns the optimal <i>liwork</i> .
<i>info</i>	INTEGER. If <i>info</i> = 0, the execution is successful. If <i>info</i> = - <i>i</i> , the <i>i</i> -th parameter had an illegal value. If <i>info</i> = <i>i</i> , the algorithm failed to compute an eigenvalue while working on the submatrix lying in rows and columns <i>i</i> /(<i>n</i> +1) through mod(<i>i</i> , <i>n</i> +1).

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `stedc` interface are the following:

<i>d</i>	Holds the vector of length <i>n</i> .
<i>e</i>	Holds the vector of length (<i>n</i> -1).
<i>z</i>	Holds the matrix <i>Z</i> of size (<i>n</i> , <i>n</i>).
<i>compz</i>	If omitted, this argument is restored based on the presence of argument <i>z</i> as follows: <i>compz</i> = 'I', if <i>z</i> is present, <i>compz</i> = 'N', if <i>z</i> is omitted. If present, <i>compz</i> must be equal to 'I' or 'V' and the argument <i>z</i> must also be present. Note that there will be an error condition if <i>compz</i> is present and <i>z</i> omitted.

Note that two variants of Fortran 95 interface for `stedc` routine are needed because of an ambiguous choice between real and complex cases appear when *z* and *work* are omitted. Thus, the name `rstedc` is used in real cases (single or double precision), and the name `stedc` is used in complex cases (single or double precision).

Application Notes

The required size of workspace arrays must be as follows.

For `ssstedc`/`dstedc`:

If *compz* = 'N' or *n* ≤ 1 then *lwork* must be at least 1.

If *compz* = 'V' and *n* > 1 then *lwork* must be at least $(1 + 3n + 2n \cdot \log_2 n + 4n^2)$, where $\log_2(n)$ = smallest integer *k* such that $2^k \geq n$.

If *compz* = 'I' and *n* > 1 then *lwork* must be at least $(1 + 4n + n^2)$.

If *compz* = 'N' or *n* ≤ 1 then *liwork* must be at least 1.

If `compz = 'V'` and $n > 1$ then *liwork* must be at least $(6 + 6n + 5n \cdot \log_2 n)$.

If `compz = 'I'` and $n > 1$ then *liwork* must be at least $(3 + 5n)$.

For `cstedc/zstedc`:

If `compz = 'N'` or `'I'`, or $n \leq 1$, *lwork* must be at least 1.

If `compz = 'V'` and $n > 1$, *lwork* must be at least n^2 .

If `compz = 'N'` or $n \leq 1$, *lrwork* must be at least 1.

If `compz = 'V'` and $n > 1$, *lrwork* must be at least $(1 + 3n + 2n \cdot \log_2 n + 4n^2)$, where $\log_2(n)$ = smallest integer k such that $2^k \geq n$.

If `compz = 'I'` and $n > 1$, *lrwork* must be at least $(1 + 4n + 2n^2)$.

The required value of *liwork* for complex flavors is the same as for real flavors.

If *lwork* (or *liwork* or *lrwork*, if supplied) is equal to -1, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*, *rwork*). This operation is called a workspace query.

Note that if *lwork* (*liwork*, *lrwork*) is less than the minimal required value and is not equal to -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?stegr

Computes selected eigenvalues and eigenvectors of a real symmetric tridiagonal matrix.

Syntax

```
call sstegr(jobz, range, n, d, e, vl, vu, il, iu, abstol, m, w, z, ldz, isuppz, work,
lwork, iwork, liwork, info)
```

```
call dstegr(jobz, range, n, d, e, vl, vu, il, iu, abstol, m, w, z, ldz, isuppz, work,
lwork, iwork, liwork, info)
```

```
call cstegr(jobz, range, n, d, e, vl, vu, il, iu, abstol, m, w, z, ldz, isuppz, work,
lwork, iwork, liwork, info)
```

```
call zstegr(jobz, range, n, d, e, vl, vu, il, iu, abstol, m, w, z, ldz, isuppz, work,
lwork, iwork, liwork, info)
```

```
call rstegr(d, e, w [,z] [,vl] [,vu] [,il] [,iu] [,m] [,isuppz] [,abstol] [,info])
```

```
call stegr(d, e, w [,z] [,vl] [,vu] [,il] [,iu] [,m] [,isuppz] [,abstol] [,info])
```

Include Files

- `mkl.fi`, `lapack.f90`

Description

The routine computes selected eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix T .

The spectrum may be computed either completely or partially by specifying either an interval $[vl, vu]$ or a range of indices $il:iu$ for the desired eigenvalues.

?stegr is a compatibility wrapper around the improved [stemr](#) routine. See its description for further details.

Note that the *abstol* parameter no longer provides any benefit and hence is no longer used.

See also auxiliary [lasq2](#)[lasq5](#), [lasq6](#), used by this routine.

Input Parameters

<i>jobz</i>	<p>CHARACTER*1. Must be 'N' or 'V'.</p> <p>If <i>jobz</i> = 'N', then only eigenvalues are computed.</p> <p>If <i>jobz</i> = 'V', then eigenvalues and eigenvectors are computed.</p>
<i>range</i>	<p>CHARACTER*1. Must be 'A' or 'V' or 'I'.</p> <p>If <i>range</i> = 'A', the routine computes all eigenvalues.</p> <p>If <i>range</i> = 'V', the routine computes eigenvalues $w(i)$ in the half-open interval:</p> $vl < w(i) \leq vu.$ <p>If <i>range</i> = 'I', the routine computes eigenvalues with indices <i>il</i> to <i>iu</i>.</p>
<i>n</i>	<p>INTEGER. The order of the matrix T ($n \geq 0$).</p>
<i>d</i> , <i>e</i> , <i>work</i>	<p>REAL for single precision flavors</p> <p>DOUBLE PRECISION for double precision flavors.</p> <p>Arrays:</p> <p><i>d</i>(*) contains the diagonal elements of T.</p> <p>The dimension of <i>d</i> must be at least $\max(1, n)$.</p> <p><i>e</i>(*) contains the subdiagonal elements of T in elements 1 to $n-1$; <i>e</i>(n) need not be set on input, but it is used as a workspace.</p> <p>The dimension of <i>e</i> must be at least $\max(1, n)$.</p> <p><i>work</i>(<i>lwork</i>) is a workspace array.</p>
<i>vl</i> , <i>vu</i>	<p>REAL for single precision flavors</p> <p>DOUBLE PRECISION for double precision flavors.</p> <p>If <i>range</i> = 'V', the lower and upper bounds of the interval to be searched for eigenvalues.</p> <p>Constraint: $vl < vu$.</p> <p>If <i>range</i> = 'A' or 'I', <i>vl</i> and <i>vu</i> are not referenced.</p>
<i>il</i> , <i>iu</i>	<p>INTEGER.</p> <p>If <i>range</i> = 'I', the indices in ascending order of the smallest and largest eigenvalues to be returned.</p> <p>Constraint: $1 \leq il \leq iu \leq n$, if $n > 0$.</p> <p>If <i>range</i> = 'A' or 'V', <i>il</i> and <i>iu</i> are not referenced.</p>
<i>abstol</i>	<p>REAL for single precision flavors</p> <p>DOUBLE PRECISION for double precision flavors.</p> <p>Unused. Was the absolute error tolerance for the eigenvalues/eigenvectors in previous versions.</p>
<i>ldz</i>	<p>INTEGER. The leading dimension of the output array <i>z</i>. Constraints:</p>

$ldz \geq 1$ if $jobz = 'N'$;
 $ldz \geq \max(1, n)$ if $jobz = 'V'$.

lwork

INTEGER.

The dimension of the array *work*,

$lwork \geq \max(1, 18*n)$ if $jobz = 'V'$, and

$lwork \geq \max(1, 12*n)$ if $jobz = 'N'$.

If $lwork = -1$, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by [xerbla](#). See *Application Notes* below for details.

iwork

INTEGER.

Workspace array, size (*liwork*).

liwork

INTEGER.

The dimension of the array *iwork*, $liwork \geq \max(1, 10*n)$ if the eigenvectors are desired, and $liwork \geq \max(1, 8*n)$ if only the eigenvalues are to be computed..

If $liwork = -1$, then a workspace query is assumed; the routine only calculates the optimal size of the *iwork* array, returns this value as the first entry of the *iwork* array, and no error message related to *liwork* is issued by [xerbla](#). See *Application Notes* below for details.

Output Parameters

d, e

On exit, *d* and *e* are overwritten.

m

INTEGER. The total number of eigenvalues found,

$0 \leq m \leq n$.

If $range = 'A'$, $m = n$, and if $range = 'I'$, $m = iu-il+1$.

w

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, size at least $\max(1, n)$.

The selected eigenvalues in ascending order, stored in $w(1)$ to $w(m)$.

z

REAL for *sstegr*

DOUBLE PRECISION for *dstegr*

COMPLEX for *cstegr*

DOUBLE COMPLEX for *zstegr*.

Array $z(ldz, *)$, the second dimension of *z* must be at least $\max(1, m)$.

If $jobz = 'V'$, and if $info = 0$, the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix *T* corresponding to the selected eigenvalues, with the *i*-th column of *z* holding the eigenvector associated with $w(i)$.

If $jobz = 'N'$, then z is not referenced.

Note: if $range = 'V'$, the exact value of m is not known in advance and an upper bound must be used. Using $n = m$ is always safe.

isuppz

INTEGER.

Array, size at least $(2 * \max(1, m))$.

The support of the eigenvectors in z , that is the indices indicating the nonzero elements in z . The i -th computed eigenvector is nonzero only in elements $isuppz(2*i-1)$ through $isuppz(2*i)$. This is relevant in the case when the matrix is split. *isuppz* is only accessed when $jobz = 'V'$, and $n > 0$.

work(1)

On exit, if $info = 0$, then *work(1)* returns the required minimal size of *work*.

iwork(1)

On exit, if $info = 0$, then *iwork(1)* returns the required minimal size of *liwork*.

info

INTEGER.

If $info = 0$, the execution is successful.

If $info = -i$, the i -th parameter had an illegal value.

If $info = 1x$, internal error in ?larre occurred,

If $info = 2x$, internal error in ?larrv occurred. Here the digit $x = \text{abs}(iinfo) < 10$, where *iinfo* is the non-zero error code returned by ?larre or ?larrv, respectively.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine *stegr* interface are the following:

<i>d</i>	Holds the vector of length n .
<i>e</i>	Holds the vector of length n .
<i>w</i>	Holds the vector of length n .
<i>z</i>	Holds the matrix Z of size (n,m) .
<i>isuppz</i>	Holds the vector of length $(2*m)$.
<i>vl</i>	Default value for this argument is $vl = - \text{HUGE} (vl)$ where $\text{HUGE}(a)$ means the largest machine number of the same precision as argument a .
<i>vu</i>	Default value for this argument is $vu = \text{HUGE} (vl)$.
<i>il</i>	Default value for this argument is $il = 1$.
<i>iu</i>	Default value for this argument is $iu = n$.

<i>abstol</i>	Default value for this argument is <i>abstol</i> = 0.0_wp.
<i>jobz</i>	Restored based on the presence of the argument <i>z</i> as follows: <i>jobz</i> = 'V', if <i>z</i> is present, <i>jobz</i> = 'N', if <i>z</i> is omitted.
<i>range</i>	Restored based on the presence of arguments <i>vl</i> , <i>vu</i> , <i>il</i> , <i>iu</i> as follows: <i>range</i> = 'V', if one of or both <i>vl</i> and <i>vu</i> are present, <i>range</i> = 'I', if one of or both <i>il</i> and <i>iu</i> are present, <i>range</i> = 'A', if none of <i>vl</i> , <i>vu</i> , <i>il</i> , <i>iu</i> is present, Note that there will be an error condition if one of or both <i>vl</i> and <i>vu</i> are present and at the same time one of or both <i>il</i> and <i>iu</i> are present.

Note that two variants of Fortran 95 interface for *stegr* routine are needed because of an ambiguous choice between real and complex cases appear when *z* is omitted. Thus, the name *rstegr* is used in real cases (single or double precision), and the name *stegr* is used in complex cases (single or double precision).

Application Notes

?*stegr* works only on machines which follow IEEE-754 floating-point standard in their handling of infinities and NaNs. Normal execution of ?*stegr* may create NaNs and infinities and hence may abort due to a floating point exception in environments which do not conform to the IEEE-754 standard.

If it is not clear how much workspace to supply, use a generous value of *lwork* (or *liwork*) for the first run, or set *lwork* = -1 (*liwork* = -1).

If *lwork* (or *liwork*) has any of admissible sizes, which is no less than the minimal value described, then the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*) on exit. Use this value (*work*(1), *iwork*(1)) for subsequent runs.

If *lwork* = -1 (*liwork* = -1), then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*). This operation is called a workspace query.

Note that if *lwork* (*liwork*) is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?*pteqr*

Computes all eigenvalues and (optionally) all eigenvectors of a real symmetric positive-definite tridiagonal matrix.

Syntax

```
call spteqr(compz, n, d, e, z, ldz, work, info)
call dpteqr(compz, n, d, e, z, ldz, work, info)
call cpteqr(compz, n, d, e, z, ldz, work, info)
call zpteqr(compz, n, d, e, z, ldz, work, info)
call rpteqr(d, e [,z] [,compz] [,info])
call pteqr(d, e [,z] [,compz] [,info])
```

Include Files

- `mkl.fi`, `lapack.f90`

Description

The routine computes all the eigenvalues and (optionally) all the eigenvectors of a real symmetric positive-definite tridiagonal matrix T . In other words, the routine can compute the spectral factorization: $T = Z \Lambda Z^T$.

Here Λ is a diagonal matrix whose diagonal elements are the eigenvalues λ_i ; Z is an orthogonal matrix whose columns are eigenvectors. Thus,

$$T z_i = \lambda_i z_i \text{ for } i = 1, 2, \dots, n.$$

(The routine normalizes the eigenvectors so that $\|z_i\|_2 = 1$.)

You can also use the routine for computing the eigenvalues and eigenvectors of real symmetric (or complex Hermitian) positive-definite matrices A reduced to tridiagonal form T : $A = Q^* T Q^H$. In this case, the spectral factorization is as follows: $A = Q^* T Q^H = (QZ)^* \Lambda (QZ)^H$. Before calling `?pteqr`, you must reduce A to tridiagonal form and generate the explicit matrix Q by calling the following routines:

	for real matrices:	for complex matrices:
full storage	<code>?sytrd</code> , <code>?orgtr</code>	<code>?hetrd</code> , <code>?ungtr</code>
packed storage	<code>?sptrd</code> , <code>?opgtr</code>	<code>?hptrd</code> , <code>?upgtr</code>
band storage	<code>?sbtrd</code> (<i>vect</i> = 'V')	<code>?hbtrd</code> (<i>vect</i> = 'V')

The routine first factorizes T as $L^* D L^H$ where L is a unit lower bidiagonal matrix, and D is a diagonal matrix. Then it forms the bidiagonal matrix $B = L^* D^{1/2}$ and calls `?bdsqr` to compute the singular values of B , which are the square roots of the eigenvalues of T .

Input Parameters

<i>compz</i>	<p>CHARACTER*1. Must be 'N' or 'I' or 'V'.</p> <p>If <i>compz</i> = 'N', the routine computes eigenvalues only.</p> <p>If <i>compz</i> = 'I', the routine computes the eigenvalues and eigenvectors of the tridiagonal matrix T.</p> <p>If <i>compz</i> = 'V', the routine computes the eigenvalues and eigenvectors of A (and the array <i>z</i> must contain the matrix Q on entry).</p>
<i>n</i>	<p>INTEGER. The order of the matrix T ($n \geq 0$).</p>
<i>d</i> , <i>e</i> , <i>work</i>	<p>REAL for single-precision flavors</p> <p>DOUBLE PRECISION for double-precision flavors.</p> <p>Arrays:</p> <p><i>d</i>(*) contains the diagonal elements of T.</p> <p>The size of <i>d</i> must be at least $\max(1, n)$.</p> <p><i>e</i>(*) contains the off-diagonal elements of T.</p> <p>The size of <i>e</i> must be at least $\max(1, n-1)$.</p> <p><i>work</i>(*) is a workspace array.</p>

The dimension of *work* must be:

at least 1 if *compz* = 'N';

at least $\max(1, 4*n-4)$ if *compz* = 'V' or 'I'.

z

REAL for *spteqr*

DOUBLE PRECISION for *dpteqr*

COMPLEX for *cpteqr*

DOUBLE COMPLEX for *zpteqr*.

Array, size (*ldz*,*)

If *compz* = 'N' or 'I', *z* need not be set.

If *compz* = 'V', *z* must contain the orthogonal matrix used in the reduction to tridiagonal form..

The second dimension of *z* must be:

at least 1 if *compz* = 'N';

at least $\max(1, n)$ if *compz* = 'V' or 'I'.

ldz

INTEGER. The leading dimension of *z*. Constraints:

$ldz \geq 1$ if *compz* = 'N';

$ldz \geq \max(1, n)$ if *compz* = 'V' or 'I'.

Output Parameters

d

The *n* eigenvalues in descending order, unless *info* > 0.

See also *info*.

e

On exit, the array is overwritten.

z

If *info* = 0, contains an *n*-by-*n* matrix the columns of which are orthonormal eigenvectors. (The *i*-th column corresponds to the *i*-th eigenvalue.)

info

INTEGER.

If *info* = 0, the execution is successful.

If *info* = *i*, the leading minor of order *i* (and hence *T* itself) is not positive-definite.

If *info* = *n* + *i*, the algorithm for computing singular values failed to converge; *i* off-diagonal elements have not converged to zero.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine *pteqr* interface are the following:

<i>d</i>	Holds the vector of length <i>n</i> .
<i>e</i>	Holds the vector of length (<i>n</i> -1).
<i>z</i>	Holds the matrix <i>Z</i> of size (<i>n</i> , <i>n</i>).
<i>compz</i>	<p>If omitted, this argument is restored based on the presence of argument <i>z</i> as follows:</p> <p><i>compz</i> = 'I', if <i>z</i> is present,</p> <p><i>compz</i> = 'N', if <i>z</i> is omitted.</p> <p>If present, <i>compz</i> must be equal to 'I' or 'V' and the argument <i>z</i> must also be present. Note that there will be an error condition if <i>compz</i> is present and <i>z</i> omitted.</p>

Note that two variants of Fortran 95 interface for `pteqr` routine are needed because of an ambiguous choice between real and complex cases appear when *z* is omitted. Thus, the name `rpteqr` is used in real cases (single or double precision), and the name `pteqr` is used in complex cases (single or double precision).

Application Notes

If λ_i is an exact eigenvalue, and μ_i is the corresponding computed value, then

$$|\mu_i - \lambda_i| \leq c(n) * \varepsilon * K * \lambda_i$$

where $c(n)$ is a modestly increasing function of n , ε is the machine precision, and $K = |||DTD||_2 * ||(DTD)^{-1}||_2$, D is diagonal with $d_{ii} = t_{ii}^{-1/2}$.

If z_i is the corresponding exact eigenvector, and w_i is the corresponding computed vector, then the angle $\theta(z_i, w_i)$ between them is bounded as follows:

$$\theta(u_i, w_i) \leq c(n) \varepsilon K / \min_{i \neq j} (|\lambda_i - \lambda_j| / (|\lambda_i| + |\lambda_j|)).$$

Here $\min_{i \neq j} (|\lambda_i - \lambda_j| / (|\lambda_i| + |\lambda_j|))$ is the *relative gap* between λ_i and the other eigenvalues.

The total number of floating-point operations depends on how rapidly the algorithm converges.

Typically, it is about

$30n^2$ if *compz* = 'N';

$6n^3$ (for complex flavors, $12n^3$) if *compz* = 'V' or 'I'.

?stebz

Computes selected eigenvalues of a real symmetric tridiagonal matrix by bisection.

Syntax

```
call sstebz (range, order, n, vl, vu, il, iu, abstol, d, e, m, nsplit, w, iblock, isplit, work, iwork, info)
```

```
call dstebz (range, order, n, vl, vu, il, iu, abstol, d, e, m, nsplit, w, iblock, isplit, work, iwork, info)
```

```
call stebz(d, e, m, nsplit, w, iblock, isplit [, order] [,vl] [,vu] [,il] [,iu] [,abstol] [,info])
```

Include Files

- `mkl.fi`, `lapack.f90`

Description

The routine computes some (or all) of the eigenvalues of a real symmetric tridiagonal matrix T by bisection. The routine searches for zero or negligible off-diagonal elements to see if T splits into block-diagonal form $T = \text{diag}(T_1, T_2, \dots)$. Then it performs bisection on each of the blocks T_i and returns the block index of each computed eigenvalue, so that a subsequent call to [stein](#) can also take advantage of the block structure.

See also [laebz](#).

Input Parameters

<i>range</i>	<p>CHARACTER*1. Must be 'A' or 'V' or 'I'.</p> <p>If <i>range</i> = 'A', the routine computes all eigenvalues.</p> <p>If <i>range</i> = 'V', the routine computes eigenvalues $w(i)$ in the half-open interval: $vl < w(i) \leq vu$.</p> <p>If <i>range</i> = 'I', the routine computes eigenvalues with indices <i>il</i> to <i>iu</i>.</p>
<i>order</i>	<p>CHARACTER*1. Must be 'B' or 'E'.</p> <p>If <i>order</i> = 'B', the eigenvalues are to be ordered from smallest to largest within each split-off block.</p> <p>If <i>order</i> = 'E', the eigenvalues for the entire matrix are to be ordered from smallest to largest.</p>
<i>n</i>	<p>INTEGER. The order of the matrix T ($n \geq 0$).</p>
<i>vl, vu</i>	<p>REAL for <code>sstebz</code></p> <p>DOUBLE PRECISION for <code>dstebz</code>.</p> <p>If <i>range</i> = 'V', the routine computes eigenvalues $w(i)$ in the half-open interval:</p> $vl < w(i) \leq vu.$ <p>If <i>range</i> = 'A' or 'I', <i>vl</i> and <i>vu</i> are not referenced.</p>
<i>il, iu</i>	<p>INTEGER. Constraint: $1 \leq il \leq iu \leq n$.</p> <p>If <i>range</i> = 'I', the routine computes eigenvalues $w(i)$ such that $il \leq i \leq iu$ (assuming that the eigenvalues $w(i)$ are in ascending order).</p> <p>If <i>range</i> = 'A' or 'V', <i>il</i> and <i>iu</i> are not referenced.</p>
<i>abstol</i>	<p>REAL for <code>sstebz</code></p> <p>DOUBLE PRECISION for <code>dstebz</code>.</p> <p>The absolute tolerance to which each eigenvalue is required. An eigenvalue (or cluster) is considered to have converged if it lies in an interval of width <i>abstol</i>.</p> <p>If $abstol \leq 0.0$, then the tolerance is taken as $\text{eps} * T$, where <i>eps</i> is the machine precision, and T is the 1-norm of the matrix T.</p>
<i>d, e, work</i>	<p>REAL for <code>sstebz</code></p> <p>DOUBLE PRECISION for <code>dstebz</code>.</p> <p>Arrays:</p>

$d(*)$ contains the diagonal elements of T .

The size of d must be at least $\max(1, n)$.

$e(*)$ contains the off-diagonal elements of T .

The size of e must be at least $\max(1, n-1)$.

$work(*)$ is a workspace array.

The dimension of $work$ must be at least $\max(1, 4n)$.

iwork

INTEGER. Workspace.

Array, size at least $\max(1, 3n)$.

Output Parameters

m

INTEGER. The actual number of eigenvalues found.

nsplit

INTEGER. The number of diagonal blocks detected in T .

w

REAL for `sstebz`

DOUBLE PRECISION for `dstebz`.

Array, size at least $\max(1, n)$. The computed eigenvalues, stored in $w(1)$ to $w(m)$.

iblock, isplit

INTEGER.

Arrays, size at least $\max(1, n)$.

A positive value $iblock(i)$ is the block number of the eigenvalue stored in $w(i)$ (see also *info*).

The leading *nsplit* elements of *isplit* contain points at which T splits into blocks T_i as follows: the block T_1 contains rows/columns 1 to *isplit*(1); the block T_2 contains rows/columns *isplit*(1)+1 to *isplit*(2), and so on.

info

INTEGER.

If *info* = 0, the execution is successful.

If *info* = 1, for *range* = 'A' or 'V', the algorithm failed to compute some of the required eigenvalues to the desired accuracy; *iblock*(*i*)<0 indicates that the eigenvalue stored in $w(i)$ failed to converge.

If *info* = 2, for *range* = 'I', the algorithm failed to compute some of the required eigenvalues. Try calling the routine again with *range* = 'A'.

If *info* = 3:

for *range* = 'A' or 'V', same as *info* = 1;

for *range* = 'I', same as *info* = 2.

If *info* = 4, no eigenvalues have been computed. The floating-point arithmetic on the computer is not behaving as expected.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `stebz` interface are the following:

<code>d</code>	Holds the vector of length n .
<code>e</code>	Holds the vector of length $(n-1)$.
<code>w</code>	Holds the vector of length n .
<code>iblock</code>	Holds the vector of length n .
<code>isplit</code>	Holds the vector of length n .
<code>order</code>	Must be 'B' or 'E'. The default value is 'B'.
<code>vl</code>	Default value for this argument is $vl = - \text{HUGE}(vl)$ where $\text{HUGE}(a)$ means the largest machine number of the same precision as argument a .
<code>vu</code>	Default value for this argument is $vu = \text{HUGE}(vu)$.
<code>il</code>	Default value for this argument is $il = 1$.
<code>iu</code>	Default value for this argument is $iu = n$.
<code>abstol</code>	Default value for this argument is $abstol = 0.0_WP$.
<code>range</code>	<p>Restored based on the presence of arguments vl, vu, il, iu as follows:</p> <p>$range = 'V'$, if one of or both vl and vu are present,</p> <p>$range = 'I'$, if one of or both il and iu are present,</p> <p>$range = 'A'$, if none of vl, vu, il, iu is present, Note that there will be an error condition if one of or both vl and vu are present and at the same time one of or both il and iu are present.</p>

Application Notes

The eigenvalues of T are computed to high relative accuracy which means that if they vary widely in magnitude, then any small eigenvalues will be computed more accurately than, for example, with the standard QR method. However, the reduction to tridiagonal form (prior to calling the routine) may exclude the possibility of obtaining high relative accuracy in the small eigenvalues of the original matrix if its eigenvalues vary widely in magnitude.

?stein

Computes the eigenvectors corresponding to specified eigenvalues of a real symmetric tridiagonal matrix.

Syntax

```
call sstein(n, d, e, m, w, iblock, isplit, z, ldz, work, iwork, ifailv, info)
call dstein(n, d, e, m, w, iblock, isplit, z, ldz, work, iwork, ifailv, info)
call cstein(n, d, e, m, w, iblock, isplit, z, ldz, work, iwork, ifailv, info)
```

```
call zstein(n, d, e, m, w, iblock, isplit, z, ldz, work, iwork, ifailv, info)
call stein(d, e, w, iblock, isplit, z [,ifailv] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes the eigenvectors of a real symmetric tridiagonal matrix T corresponding to specified eigenvalues, by inverse iteration. It is designed to be used in particular after the specified eigenvalues have been computed by `?stebz` with `order = 'B'`, but may also be used when the eigenvalues have been computed by other routines.

If you use this routine after `?stebz`, it can take advantage of the block structure by performing inverse iteration on each block T_i separately, which is more efficient than using the whole matrix T .

If T has been formed by reduction of a full symmetric or Hermitian matrix A to tridiagonal form, you can transform eigenvectors of T to eigenvectors of A by calling `?ormtr` or `?opmtr` (for real flavors) or by calling `?unmtr` or `?upmtr` (for complex flavors).

Input Parameters

<i>n</i>	INTEGER. The order of the matrix T ($n \geq 0$).
<i>m</i>	INTEGER. The number of eigenvectors to be returned.
<i>d, e, w</i>	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors. Arrays: <i>d</i> (*) contains the diagonal elements of T . The size of <i>d</i> must be at least $\max(1, n)$. <i>e</i> (*) contains the sub-diagonal elements of T stored in elements 1 to $n-1$. The size of <i>e</i> must be at least $\max(1, n-1)$. <i>w</i> (*) contains the eigenvalues of T , stored in $w(1)$ to $w(m)$ (as returned by stebz). Eigenvalues of T_1 must be supplied first, in non-decreasing order; then those of T_2 , again in non-decreasing order, and so on. Constraint: if $iblock(i) = iblock(i+1)$, $w(i) \leq w(i+1)$. The size of <i>w</i> must be at least $\max(1, n)$.
<i>iblock, isplit</i>	INTEGER. Arrays, size at least $\max(1, n)$. The arrays <i>iblock</i> and <i>isplit</i> , as returned by <code>?stebz</code> with <code>order = 'B'</code> . If you did not call <code>?stebz</code> with <code>order = 'B'</code> , set all elements of <i>iblock</i> to 1, and <i>isplit</i> (1) to n .)
<i>ldz</i>	INTEGER. The leading dimension of the output array <i>z</i> ; $ldz \geq \max(1, n)$.
<i>work</i>	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors.

Workspace array, size at least $\max(1, 5n)$.

iwork

INTEGER.

Workspace array, size at least $\max(1, n)$.

Output Parameters

z

REAL for *sstein*

DOUBLE PRECISION for *dstein*

COMPLEX for *cstein*

DOUBLE COMPLEX for *zstein*.

Array, size (*ldz*, *).

If *info* = 0, *z* contains an *n*-by-*n* matrix the columns of which are orthonormal eigenvectors. (The *i*-th column corresponds to the *i*th eigenvalue.)

ifailv

INTEGER.

Array, size at least $\max(1, m)$.

If *info* = *i* > 0, the first *i* elements of *ifailv* contain the indices of any eigenvectors that failed to converge.

info

INTEGER.

If *info* = 0, the execution is successful.

If *info* = *i*, then *i* eigenvectors (as indicated by the parameter *ifailv*) each failed to converge in 5 iterations. The current iterates are stored in the corresponding columns of the array *z*.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine *stein* interface are the following:

d

Holds the vector of length *n*.

e

Holds the vector of length *n*.

w

Holds the vector of length *n*.

iblock

Holds the vector of length *n*.

isplit

Holds the vector of length *n*.

z

Holds the matrix *Z* of size (*n*,*m*).

ifailv

Holds the vector of length (*m*).

Application Notes

Each computed eigenvector z_i is an exact eigenvector of a matrix $T+E_i$, where $\|E_i\|_2 = O(\epsilon) * \|T\|_2$. However, a set of eigenvectors computed by this routine may not be orthogonal to so high a degree of accuracy as those computed by `?steqr`.

?disna

Computes the reciprocal condition numbers for the eigenvectors of a symmetric/ Hermitian matrix or for the left or right singular vectors of a general matrix.

Syntax

```
call sdisna(job, m, n, d, sep, info)
call ddisna(job, m, n, d, sep, info)
call disna(d, sep [,job] [,minmn] [,info])
```

Include Files

- `mkl.fi`, `lapack.f90`

Description

The routine computes the reciprocal condition numbers for the eigenvectors of a real symmetric or complex Hermitian matrix or for the left or right singular vectors of a general m -by- n matrix.

The reciprocal condition number is the 'gap' between the corresponding eigenvalue or singular value and the nearest other one.

The bound on the error, measured by angle in radians, in the i -th computed vector is given by

```
?lamch('E')*(anorm/sep(i))
```

where $anorm = \|A\|_2 = \max(|d(j)|)$. $sep(i)$ is not allowed to be smaller than `slamch('E')*anorm` in order to limit the size of the error bound.

`?disna` may also be used to compute error bounds for eigenvectors of the generalized symmetric definite eigenproblem.

Input Parameters

<i>job</i>	CHARACTER*1. Must be 'E', 'L', or 'R'. Specifies for which problem the reciprocal condition numbers should be computed: <i>job</i> = 'E': for the eigenvectors of a symmetric/Hermitian matrix; <i>job</i> = 'L': for the left singular vectors of a general matrix; <i>job</i> = 'R': for the right singular vectors of a general matrix.
<i>m</i>	INTEGER. The number of rows of the matrix ($m \geq 0$).
<i>n</i>	INTEGER. If <i>job</i> = 'L', or 'R', the number of columns of the matrix ($n \geq 0$). Ignored if <i>job</i> = 'E'.
<i>d</i>	REAL for <code>sdisna</code> DOUBLE PRECISION for <code>ddisna</code> .

Array, dimension at least $\max(1,m)$ if $job = 'E'$, and at least $\max(1, \min(m,n))$ if $job = 'L'$ or $'R'$.

This array must contain the eigenvalues (if $job = 'E'$) or singular values (if $job = 'L'$ or $'R'$) of the matrix, in either increasing or decreasing order.

If singular values, they must be non-negative.

Output Parameters

sep

REAL for *sdisna*

DOUBLE PRECISION for *ddisna*.

Array, dimension at least $\max(1,m)$ if $job = 'E'$, and at least $\max(1, \min(m,n))$ if $job = 'L'$ or $'R'$. The reciprocal condition numbers of the vectors.

info

INTEGER.

If $info = 0$, the execution is successful.

If $info = -i$, the i -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine *disna* interface are the following:

d

Holds the vector of length $\min(m,n)$.

sep

Holds the vector of length $\min(m,n)$.

job

Must be $'E'$, $'L'$, or $'R'$. The default value is $'E'$.

minmn

Indicates which of the values m or n is smaller. Must be either $'M'$ or $'N'$, the default is $'M'$.

If $job = 'E'$, this argument is superfluous, If $job = 'L'$ or $'R'$, this argument is used by the routine.

Generalized Symmetric-Definite Eigenvalue Problems

Generalized symmetric-definite eigenvalue problems are as follows: find the eigenvalues λ and the corresponding eigenvectors z that satisfy one of these equations:

$$Az = \lambda Bz, ABz = \lambda z, \text{ or } BAz = \lambda z,$$

where A is an n -by- n symmetric or Hermitian matrix, and B is an n -by- n symmetric positive-definite or Hermitian positive-definite matrix.

In these problems, there exist n real eigenvectors corresponding to real eigenvalues (even for complex Hermitian matrices A and B).

Routines described in this section allow you to reduce the above generalized problems to standard symmetric eigenvalue problem $Cy = \lambda y$, which you can solve by calling LAPACK routines described earlier in this chapter (see [Symmetric Eigenvalue Problems](#)).

Different routines allow the matrices to be stored either conventionally or in packed storage. Prior to reduction, the positive-definite matrix B must first be factorized using either [potrf](#) or [pptrf](#).

The reduction routine for the banded matrices A and B uses a split Cholesky factorization for which a specific routine [pbstf](#) is provided. This refinement halves the amount of work required to form matrix C .

Table "Computational Routines for Reducing Generalized Eigenproblems to Standard Problems" lists LAPACK routines that can be used to solve generalized symmetric-definite eigenvalue problems. The corresponding routine names in the Fortran 95 interface are without the first symbol.

Computational Routines for Reducing Generalized Eigenproblems to Standard Problems

Matrix type	Reduce to standard problems (full storage)	Reduce to standard problems (packed storage)	Reduce to standard problems (band matrices)	Factorize band matrix
real symmetric matrices	sygst	spgst	sbgst	pbstf
complex Hermitian matrices	hegst	hpgst	hbgst	pbstf

?sygst

Reduces a real symmetric-definite generalized eigenvalue problem to the standard form.

Syntax

```
call ssygst(itype, uplo, n, a, lda, b, ldb, info)
call dsygst(itype, uplo, n, a, lda, b, ldb, info)
call sygst(a, b [,itype] [,uplo] [,info])
```

Include Files

- `mkl.fi`, `lapack.f90`

Description

The routine reduces real symmetric-definite generalized eigenproblems

$$A^*z = \lambda^*B^*z, \quad A^*B^*z = \lambda^*z, \quad \text{or} \quad B^*A^*z = \lambda^*z$$

to the standard form $C^*y = \lambda^*y$. Here A is a real symmetric matrix, and B is a real symmetric positive-definite matrix. Before calling this routine, call [?potrf](#) to compute the Cholesky factorization: $B = U^T * U$ or $B = L * L^T$.

Input Parameters

itype INTEGER. Must be 1 or 2 or 3.

If *itype* = 1, the generalized eigenproblem is $A^*z = \lambda^*B^*z$
for *uplo* = 'U': $C = \text{inv}(U^T) * A * \text{inv}(U)$, $z = \text{inv}(U) * y$;
for *uplo* = 'L': $C = \text{inv}(L) * A * \text{inv}(L^T)$, $z = \text{inv}(L^T) * y$.

If *itype* = 2, the generalized eigenproblem is $A^*B^*z = \lambda^*z$
for *uplo* = 'U': $C = U^*A^*U^T$, $z = \text{inv}(U) * y$;
for *uplo* = 'L': $C = L^T * A^*L$, $z = \text{inv}(L^T) * y$.

If $itype = 3$, the generalized eigenproblem is $B^*A^*z = \lambda z$

for $uplo = 'U'$: $C = U^*A^*U^T$, $z = U^T*y$;

for $uplo = 'L'$: $C = L^T*A^*L$, $z = L*y$.

uplo

CHARACTER*1. Must be 'U' or 'L'.

If $uplo = 'U'$, the array *a* stores the upper triangle of *A*; you must supply *B* in the factored form $B = U^T*U$.

If $uplo = 'L'$, the array *a* stores the lower triangle of *A*; you must supply *B* in the factored form $B = L*L^T$.

n

INTEGER. The order of the matrices *A* and *B* ($n \geq 0$).

a, b

REAL for *ssygst*

DOUBLE PRECISION for *dsygst*.

Arrays:

a(lda,)* contains the upper or lower triangle of *A*.

The second dimension of *a* must be at least $\max(1, n)$.

b(ldb,)* contains the Cholesky-factored matrix *B*:

$B = U^T*U$ or $B = L*L^T$ (as returned by *?potrf*).

The second dimension of *b* must be at least $\max(1, n)$.

lda

INTEGER. The leading dimension of *a*; at least $\max(1, n)$.

ldb

INTEGER. The leading dimension of *b*; at least $\max(1, n)$.

Output Parameters

a

The upper or lower triangle of *A* is overwritten by the upper or lower triangle of *C*, as specified by the arguments *itype* and *uplo*.

info

INTEGER.

If $info = 0$, the execution is successful.

If $info = -i$, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine *sygst* interface are the following:

a

Holds the matrix *A* of size (n,n) .

b

Holds the matrix *B* of size (n,n) .

itype

Must be 1, 2, or 3. The default value is 1.

uplo

Must be 'U' or 'L'. The default value is 'U'.

Application Notes

Forming the reduced matrix C is a stable procedure. However, it involves implicit multiplication by $\text{inv}(B)$ (if $\text{itype} = 1$) or B (if $\text{itype} = 2$ or 3). When the routine is used as a step in the computation of eigenvalues and eigenvectors of the original problem, there may be a significant loss of accuracy if B is ill-conditioned with respect to inversion.

The approximate number of floating-point operations is n^3 .

?hegst

Reduces a complex Hermitian positive-definite generalized eigenvalue problem to the standard form.

Syntax

```
call chegst(itype, uplo, n, a, lda, b, ldb, info)
call zhegst(itype, uplo, n, a, lda, b, ldb, info)
call hegst(a, b [,itype] [,uplo] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine reduces a complex Hermitian positive-definite generalized eigenvalue problem to standard form.

<i>itype</i>	Problem	Result
1	$A^*x = \lambda^*B^*x$	A overwritten by $\text{inv}(U^H) * A * \text{inv}(U)$ or $\text{inv}(L) * A * \text{inv}(L^H)$
2	$A^*B^*x = \lambda^*x$	A overwritten by $U^*A^*U^H$ or L^H*A*L
3	$B^*A^*x = \lambda^*x$	

Before calling this routine, you must call ?potrf to compute the Cholesky factorization: $B = U^H * U$ or $B = L * L^H$.

Input Parameters

itype INTEGER. Must be 1 or 2 or 3.

If $\text{itype} = 1$, the generalized eigenproblem is $A^*z = \text{lambda}^*B^*z$
for $\text{uplo} = 'U'$: $C = (U^H)^{-1} * A^* U^{-1}$;
for $\text{uplo} = 'L'$: $C = L^{-1} * A^* (L^H)^{-1}$.

If $\text{itype} = 2$, the generalized eigenproblem is $A^*B^*z = \text{lambda}^*z$
for $\text{uplo} = 'U'$: $C = U^*A^*U^H$;
for $\text{uplo} = 'L'$: $C = L^H*A*L$.

If $\text{itype} = 3$, the generalized eigenproblem is $B^*A^*z = \text{lambda}^*z$
for $\text{uplo} = 'U'$: $C = U^*A^*U^H$;
for $\text{uplo} = 'L'$: $C = L^H*A*L$.

uplo CHARACTER*1. Must be 'U' or 'L'.

If $uplo = 'U'$, the array a stores the upper triangle of A ; you must supply B in the factored form $B = U^H * U$.

If $uplo = 'L'$, the array a stores the lower triangle of A ; you must supply B in the factored form $B = L * L^H$.

n INTEGER. The order of the matrices A and B ($n \geq 0$).

a, b COMPLEX for `chegst`
DOUBLE COMPLEX for `zhegst`.

Arrays:

$a(lda,*)$ contains the upper or lower triangle of A .

The second dimension of a must be at least $\max(1, n)$.

$b(l db,*)$ contains the Cholesky-factored matrix B :

$B = U^H * U$ or $B = L * L^H$ (as returned by `?potrf`).

The second dimension of b must be at least $\max(1, n)$.

lda INTEGER. The leading dimension of a ; at least $\max(1, n)$.

ldb INTEGER. The leading dimension of b ; at least $\max(1, n)$.

Output Parameters

a The upper or lower triangle of A is overwritten by the upper or lower triangle of C , as specified by the arguments $itype$ and $uplo$.

$info$ INTEGER.
If $info = 0$, the execution is successful.
If $info = -i$, the i -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `hegst` interface are the following:

a Holds the matrix A of size (n,n) .
 b Holds the matrix B of size (n,n) .
 $itype$ Must be 1, 2, or 3. The default value is 1.
 $uplo$ Must be 'U' or 'L'. The default value is 'U'.

Application Notes

Forming the reduced matrix C is a stable procedure. However, it involves implicit multiplication by B^{-1} (if $itype = 1$) or B (if $itype = 2$ or 3). When the routine is used as a step in the computation of eigenvalues and eigenvectors of the original problem, there may be a significant loss of accuracy if B is ill-conditioned with respect to inversion.

The approximate number of floating-point operations is n^3 .

?spgst

Reduces a real symmetric-definite generalized eigenvalue problem to the standard form using packed storage.

Syntax

```
call sspgst(itype, uplo, n, ap, bp, info)
call dspgst(itype, uplo, n, ap, bp, info)
call spgst(ap, bp [,itype] [,uplo] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine reduces real symmetric-definite generalized eigenproblems

$$A*x = \lambda*B*x, A*B*x = \lambda*x, \text{ or } B*A*x = \lambda*x$$

to the standard form $C*y = \lambda*y$, using packed matrix storage. Here A is a real symmetric matrix, and B is a real symmetric positive-definite matrix. Before calling this routine, call ?pptrf to compute the Cholesky factorization: $B = U^T*U$ or $B = L*L^T$.

Input Parameters

<i>itype</i>	<p>INTEGER. Must be 1 or 2 or 3.</p> <p>If <i>itype</i> = 1, the generalized eigenproblem is $A*z = \lambda*B*z$</p> <p>for <i>uplo</i> = 'U': $C = \text{inv}(U^T)*A*\text{inv}(U)$, $z = \text{inv}(U)*y$;</p> <p>for <i>uplo</i> = 'L': $C = \text{inv}(L)*A*\text{inv}(L^T)$, $z = \text{inv}(L^T)*y$.</p> <p>If <i>itype</i> = 2, the generalized eigenproblem is $A*B*z = \lambda*z$</p> <p>for <i>uplo</i> = 'U': $C = U*A*U^T$, $z = \text{inv}(U)*y$;</p> <p>for <i>uplo</i> = 'L': $C = L^T*A*L$, $z = \text{inv}(L^T)*y$.</p> <p>If <i>itype</i> = 3, the generalized eigenproblem is $B*A*z = \lambda*z$</p> <p>for <i>uplo</i> = 'U': $C = U*A*U^T$, $z = U^T*y$;</p> <p>for <i>uplo</i> = 'L': $C = L^T*A*L$, $z = L*y$.</p>
<i>uplo</i>	<p>CHARACTER*1. Must be 'U' or 'L'.</p> <p>If <i>uplo</i> = 'U', <i>ap</i> stores the packed upper triangle of A;</p> <p>you must supply B in the factored form $B = U^T*U$.</p> <p>If <i>uplo</i> = 'L', <i>ap</i> stores the packed lower triangle of A;</p> <p>you must supply B in the factored form $B = L*L^T$.</p>
<i>n</i>	<p>INTEGER. The order of the matrices A and B ($n \geq 0$).</p>
<i>ap, bp</i>	<p>REAL for sspgst</p> <p>DOUBLE PRECISION for dspgst.</p>

Arrays:

ap(*) contains the packed upper or lower triangle of *A*.

The dimension of *ap* must be at least $\max(1, n*(n+1)/2)$.

bp(*) contains the packed Cholesky factor of *B* (as returned by `?pptrf` with the same *uplo* value).

The dimension of *bp* must be at least $\max(1, n*(n+1)/2)$.

Output Parameters

ap The upper or lower triangle of *A* is overwritten by the upper or lower triangle of *C*, as specified by the arguments *itype* and *uplo*.

info INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `spgst` interface are the following:

ap Holds the array *A* of size $(n*(n+1)/2)$.

bp Holds the array *B* of size $(n*(n+1)/2)$.

itype Must be 1, 2, or 3. The default value is 1.

uplo Must be 'U' or 'L'. The default value is 'U'.

Application Notes

Forming the reduced matrix *C* is a stable procedure. However, it involves implicit multiplication by $\text{inv}(B)$ (if *itype* = 1) or *B* (if *itype* = 2 or 3). When the routine is used as a step in the computation of eigenvalues and eigenvectors of the original problem, there may be a significant loss of accuracy if *B* is ill-conditioned with respect to inversion.

The approximate number of floating-point operations is n^3 .

?hpgst

Reduces a generalized eigenvalue problem with a Hermitian matrix to a standard eigenvalue problem using packed storage.

Syntax

```
call chpgst(itype, uplo, n, ap, bp, info)
call zhpst(itype, uplo, n, ap, bp, info)
call hpgst(ap, bp [,itype] [,uplo] [,info])
```

Include Files

- `mkl.fi`, `lapack.f90`

Description

The routine reduces generalized eigenproblems with Hermitian matrices

$$A^*z = \lambda^*B^*z, A^*B^*z = \lambda^*z, \text{ or } B^*A^*z = \lambda^*z.$$

to standard eigenproblems $C^*y = \lambda^*y$, using packed matrix storage. Here A is a complex Hermitian matrix, and B is a complex Hermitian positive-definite matrix. Before calling this routine, you must call `?pptrf` to compute the Cholesky factorization: $B = U^H*U$ or $B = L*L^H$.

Input Parameters

<i>itype</i>	<p>INTEGER. Must be 1 or 2 or 3.</p> <p>If <i>itype</i> = 1, the generalized eigenproblem is $A^*z = \lambda^*B^*z$</p> <p>for <i>uplo</i> = 'U': $C = \text{inv}(U^H)*A*\text{inv}(U)$, $z = \text{inv}(U)*y$;</p> <p>for <i>uplo</i> = 'L': $C = \text{inv}(L)*A*\text{inv}(L^H)$, $z = \text{inv}(L^H)*y$.</p> <p>If <i>itype</i> = 2, the generalized eigenproblem is $A^*B^*z = \lambda^*z$</p> <p>for <i>uplo</i> = 'U': $C = U^*A^*U^H$, $z = \text{inv}(U)*y$;</p> <p>for <i>uplo</i> = 'L': $C = L^H*A^*L$, $z = \text{inv}(L^H)*y$.</p> <p>If <i>itype</i> = 3, the generalized eigenproblem is $B^*A^*z = \lambda^*z$</p> <p>for <i>uplo</i> = 'U': $C = U^*A^*U^H$, $z = U^H*y$;</p> <p>for <i>uplo</i> = 'L': $C = L^H*A^*L$, $z = L*y$.</p>
<i>uplo</i>	<p>CHARACTER*1. Must be 'U' or 'L'.</p> <p>If <i>uplo</i> = 'U', <i>ap</i> stores the packed upper triangle of A; you must supply B in the factored form $B = U^H*U$.</p> <p>If <i>uplo</i> = 'L', <i>ap</i> stores the packed lower triangle of A; you must supply B in the factored form $B = L*L^H$.</p>
<i>n</i>	<p>INTEGER. The order of the matrices A and B ($n \geq 0$).</p>
<i>ap</i> , <i>bp</i>	<p>COMPLEX for <code>chpgstDOUBLE</code> COMPLEX for <code>zhpgst</code>.</p> <p>Arrays:</p> <p><i>ap</i>(*) contains the packed upper or lower triangle of A.</p> <p>The dimension of <i>a</i> must be at least $\max(1, n*(n+1)/2)$.</p> <p><i>bp</i>(*) contains the packed Cholesky factor of B (as returned by <code>?pptrf</code> with the same <i>uplo</i> value).</p> <p>The dimension of <i>b</i> must be at least $\max(1, n*(n+1)/2)$.</p>

Output Parameters

<i>ap</i>	The upper or lower triangle of A is overwritten by the upper or lower triangle of C , as specified by the arguments <i>itype</i> and <i>uplo</i> .
<i>info</i>	INTEGER.

If $info = 0$, the execution is successful.

If $info = -i$, the i -th parameter had an illegal value.

LAPACK 95 Interface Notes

The approximate number of floating-point operations is n^3 .

?sbgst

Reduces a real symmetric-definite generalized eigenproblem for banded matrices to the standard form using the factorization performed by ?pbstf.

Syntax

```
call ssbgst(vect, uplo, n, ka, kb, ab, ldab, bb, ldbb, x, ldx, work, info)
call dsbgst(vect, uplo, n, ka, kb, ab, ldab, bb, ldbb, x, ldx, work, info)
call sbgst(ab, bb [,x] [,uplo] [,info])
```

Include Files

- `mk1.fi`, `lapack.f90`

Description

To reduce the real symmetric-definite generalized eigenproblem $A^*z = \lambda^*B^*z$ to the standard form $C^*y = \lambda^*y$, where A , B and C are banded, this routine must be preceded by a call to [pbstf](#), which computes the split Cholesky factorization of the positive-definite matrix B : $B = S^T * S$. The split Cholesky factorization, compared with the ordinary Cholesky factorization, allows the work to be approximately halved.

This routine overwrites A with $C = X^T * A * X$, where $X = \text{inv}(S) * Q$ and Q is an orthogonal matrix chosen (implicitly) to preserve the bandwidth of A . The routine also has an option to allow the accumulation of X , and then, if z is an eigenvector of C , X^*z is an eigenvector of the original system.

Input Parameters

`vect` CHARACTER*1. Must be 'N' or 'V'.

	<p>If <code>vect = 'N'</code>, then matrix X is not returned;</p> <p>If <code>vect = 'V'</code>, then matrix X is returned.</p>
<code>uplo</code>	<p>CHARACTER*1. Must be 'U' or 'L'.</p> <p>If <code>uplo = 'U'</code>, ab stores the upper triangular part of A.</p> <p>If <code>uplo = 'L'</code>, ab stores the lower triangular part of A.</p>
<code>n</code>	INTEGER. The order of the matrices A and B ($n \geq 0$).
<code>ka</code>	<p>INTEGER. The number of super- or sub-diagonals in A</p> <p>($ka \geq 0$).</p>
<code>kb</code>	<p>INTEGER. The number of super- or sub-diagonals in B</p> <p>($ka \geq kb \geq 0$).</p>
<code>ab, bb, work</code>	<p>REAL for ssbgst</p> <p>DOUBLE PRECISION for dsbgst</p> <p>$ab(ldab,*)$ is an array containing either upper or lower triangular part of the symmetric matrix A (as specified by <code>uplo</code>) in band storage format.</p> <p>The second dimension of the array ab must be at least $\max(1, n)$.</p> <p>$bb(lbdb,*)$ is an array containing the banded split Cholesky factor of B as specified by <code>uplo</code>, n and <code>kb</code> and returned by pbstf/pbstf.</p> <p>The second dimension of the array bb must be at least $\max(1, n)$.</p> <p>$work(*)$ is a workspace array, dimension at least $\max(1, 2*n)$</p>
<code>ldab</code>	INTEGER. The leading dimension of the array ab ; must be at least $ka+1$.
<code>ldbdb</code>	INTEGER. The leading dimension of the array bb ; must be at least $kb+1$.
<code>ldx</code>	<p>The leading dimension of the output array x. Constraints: if <code>vect = 'N'</code>, then $ldx \geq 1$;</p> <p>if <code>vect = 'V'</code>, then $ldx \geq \max(1, n)$.</p>

Output Parameters

<code>ab</code>	On exit, this array is overwritten by the upper or lower triangle of C as specified by <code>uplo</code> .
<code>x</code>	<p>REAL for ssbgst</p> <p>DOUBLE PRECISION for dsbgst</p> <p>Array.</p> <p>If <code>vect = 'V'</code>, then $x(ldx,*)$ contains the n-by-n matrix $X = \text{inv}(S) * Q$.</p> <p>If <code>vect = 'N'</code>, then x is not referenced.</p> <p>The second dimension of x must be:</p> <p>at least $\max(1, n)$, if <code>vect = 'V'</code>;</p>

at least 1, if `vect = 'N'`.

`info`

INTEGER.

If `info = 0`, the execution is successful.

If `info = -i`, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `sbgst` interface are the following:

<code>ab</code>	Holds the array <i>A</i> of size $(ka+1, n)$.
<code>bb</code>	Holds the array <i>B</i> of size $(kb+1, n)$.
<code>x</code>	Holds the matrix <i>X</i> of size (n, n) .
<code>uplo</code>	Must be 'U' or 'L'. The default value is 'U'.
<code>vect</code>	Restored based on the presence of the argument <i>x</i> as follows: <code>vect = 'V'</code> , if <i>x</i> is present, <code>vect = 'N'</code> , if <i>x</i> is omitted.

Application Notes

Forming the reduced matrix *C* involves implicit multiplication by $\text{inv}(B)$. When the routine is used as a step in the computation of eigenvalues and eigenvectors of the original problem, there may be a significant loss of accuracy if *B* is ill-conditioned with respect to inversion.

If *ka* and *kb* are much less than *n* then the total number of floating-point operations is approximately $6n^2 \cdot kb$, when `vect = 'N'`. Additional $(3/2)n^3 \cdot (kb/ka)$ operations are required when `vect = 'V'`.

?hbgst

Reduces a complex Hermitian positive-definite generalized eigenproblem for banded matrices to the standard form using the factorization performed by ?pbstf.

Syntax

```
call chbgst(vect, uplo, n, ka, kb, ab, ldab, bb, ldbb, x, ldx, work, rwork, info)
```

```
call zhbgst(vect, uplo, n, ka, kb, ab, ldab, bb, ldbb, x, ldx, work, rwork, info)
```

```
call hbgst(ab, bb [,x] [,uplo] [,info])
```

Include Files

- `mk1.fi`, `lapack.f90`

Description

To reduce the complex Hermitian positive-definite generalized eigenproblem $A^*Z = \lambda^*B^*Z$ to the standard form $C^*X = \lambda^*Y$, where A , B and C are banded, this routine must be preceded by a call to [pbstf/pbstf](#), which computes the split Cholesky factorization of the positive-definite matrix B : $B = S^H * S$. The split Cholesky factorization, compared with the ordinary Cholesky factorization, allows the work to be approximately halved.

This routine overwrites A with $C = X^H * A * X$, where $X = \text{inv}(S) * Q$, and Q is a unitary matrix chosen (implicitly) to preserve the bandwidth of A . The routine also has an option to allow the accumulation of X , and then, if z is an eigenvector of C , $X * z$ is an eigenvector of the original system.

Input Parameters

<i>vect</i>	<p>CHARACTER*1. Must be 'N' or 'V'.</p> <p>If <i>vect</i> = 'N', then matrix X is not returned;</p> <p>If <i>vect</i> = 'V', then matrix X is returned.</p>
<i>uplo</i>	<p>CHARACTER*1. Must be 'U' or 'L'.</p> <p>If <i>uplo</i> = 'U', <i>ab</i> stores the upper triangular part of A.</p> <p>If <i>uplo</i> = 'L', <i>ab</i> stores the lower triangular part of A.</p>
<i>n</i>	INTEGER. The order of the matrices A and B ($n \geq 0$).
<i>ka</i>	INTEGER. The number of super- or sub-diagonals in A ($ka \geq 0$).
<i>kb</i>	INTEGER. The number of super- or sub-diagonals in B ($ka \geq kb \geq 0$).
<i>ab, bb, work</i>	<p>COMPLEX for <code>chbgst</code> DOUBLE COMPLEX for <code>zhbgst</code></p> <p><i>ab</i>(<i>ldab</i>,*) is an array containing either upper or lower triangular part of the Hermitian matrix A (as specified by <i>uplo</i>) in band storage format.</p> <p>The second dimension of the array <i>ab</i> must be at least $\max(1, n)$.</p> <p><i>bb</i>(<i>ldbb</i>,*) is an array containing the banded split Cholesky factor of B as specified by <i>uplo</i>, n and <i>kb</i> and returned by pbstf/pbstf.</p> <p>The second dimension of the array <i>bb</i> must be at least $\max(1, n)$.</p> <p><i>work</i>(*) is a workspace array, dimension at least $\max(1, n)$</p>
<i>ldab</i>	INTEGER. The leading dimension of the array <i>ab</i> ; must be at least $ka+1$.
<i>ldbb</i>	INTEGER. The leading dimension of the array <i>bb</i> ; must be at least $kb+1$.
<i>ldx</i>	<p>The leading dimension of the output array x. Constraints:</p> <p>if <i>vect</i> = 'N', then $ldx \geq 1$;</p> <p>if <i>vect</i> = 'V', then $ldx \geq \max(1, n)$.</p>
<i>rwork</i>	<p>REAL for <code>chbgst</code></p> <p>DOUBLE PRECISION for <code>zhbgst</code></p> <p>Workspace array, dimension at least $\max(1, n)$</p>

Output Parameters

<i>ab</i>	On exit, this array is overwritten by the upper or lower triangle of <i>C</i> as specified by <i>uplo</i> .
<i>x</i>	COMPLEX for <i>chbgst</i> DOUBLE COMPLEX for <i>zhbgst</i> Array. If <i>vect</i> = 'V', then <i>x</i> (<i>ldx</i> ,*) contains the <i>n</i> -by- <i>n</i> matrix $X = \text{inv}(S) * Q$. If <i>vect</i> = 'N', then <i>x</i> is not referenced. The second dimension of <i>x</i> must be: at least $\max(1, n)$, if <i>vect</i> = 'V'; at least 1, if <i>vect</i> = 'N'.
<i>info</i>	INTEGER. If <i>info</i> = 0, the execution is successful. If <i>info</i> = - <i>i</i> , the <i>i</i> -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine *hbgst* interface are the following:

<i>ab</i>	Holds the array <i>A</i> of size (<i>ka</i> +1, <i>n</i>).
<i>bb</i>	Holds the array <i>B</i> of size (<i>kb</i> +1, <i>n</i>).
<i>x</i>	Holds the matrix <i>X</i> of size (<i>n</i> , <i>n</i>).
<i>uplo</i>	Must be 'U' or 'L'. The default value is 'U'.
<i>vect</i>	Restored based on the presence of the argument <i>x</i> as follows: <i>vect</i> = 'V', if <i>x</i> is present, <i>vect</i> = 'N', if <i>x</i> is omitted.

Application Notes

Forming the reduced matrix *C* involves implicit multiplication by $\text{inv}(B)$. When the routine is used as a step in the computation of eigenvalues and eigenvectors of the original problem, there may be a significant loss of accuracy if *B* is ill-conditioned with respect to inversion. The total number of floating-point operations is approximately $20n^2 * kb$, when *vect* = 'N'. Additional $5n^3 * (kb/ka)$ operations are required when *vect* = 'V'. All these estimates assume that both *ka* and *kb* are much less than *n*.

?pbstf

Computes a split Cholesky factorization of a real symmetric or complex Hermitian positive-definite banded matrix used in ?sbgst/?hbgst.

Syntax

```
call spbstf(uplo, n, kb, bb, ldbb, info)
```

```
call dpbstf(uplo, n, kb, bb, ldbb, info)
call cpbstf(uplo, n, kb, bb, ldbb, info)
call zpbstf(uplo, n, kb, bb, ldbb, info)
call pbstf(bb [, uplo] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes a split Cholesky factorization of a real symmetric or complex Hermitian positive-definite band matrix B . It is to be used in conjunction with [sbgst/hbgst](#).

The factorization has the form $B = S^T * S$ (or $B = S^H * S$ for complex flavors), where S is a band matrix of the same bandwidth as B and the following structure: S is upper triangular in the first $(n+kb)/2$ rows and lower triangular in the remaining rows.

Input Parameters

<i>uplo</i>	CHARACTER*1. Must be 'U' or 'L'. If <i>uplo</i> = 'U', <i>bb</i> stores the upper triangular part of B . If <i>uplo</i> = 'L', <i>bb</i> stores the lower triangular part of B .
<i>n</i>	INTEGER. The order of the matrix B ($n \geq 0$).
<i>kb</i>	INTEGER. The number of super- or sub-diagonals in B ($kb \geq 0$).
<i>bb</i>	REAL for spbstf DOUBLE PRECISION for dpbstf COMPLEX for cpbstf DOUBLE COMPLEX for zpbstf. <i>bb(ldb,*)</i> is an array containing either upper or lower triangular part of the matrix B (as specified by <i>uplo</i>) in band storage format. The second dimension of the array <i>bb</i> must be at least $\max(1, n)$.
<i>ldb</i>	INTEGER. The leading dimension of <i>bb</i> ; must be at least $kb+1$.

Output Parameters

<i>bb</i>	On exit, this array is overwritten by the elements of the split Cholesky factor S .
<i>info</i>	INTEGER. If <i>info</i> = 0, the execution is successful. If <i>info</i> = <i>i</i> , then the factorization could not be completed, because the updated element b_{ii} would be the square root of a negative number; hence the matrix B is not positive-definite. If <i>info</i> = - <i>i</i> , the <i>i</i> -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `pbstf` interface are the following:

<code>bb</code>	Holds the array B of size $(kb+1, n)$.
<code>uplo</code>	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The computed factor S is the exact factor of a perturbed matrix $B + E$, where

$$|E| \leq c(kb + 1)\varepsilon \|S\| |S|, \quad |e_{ij}| \leq c(kb + 1)\varepsilon \sqrt{b_{ii}b_{jj}}$$

$c(n)$ is a modest linear function of n , and ε is the machine precision.

The total number of floating-point operations for real flavors is approximately $n(kb+1)^2$. The number of operations for complex flavors is 4 times greater. All these estimates assume that kb is much less than n .

After calling this routine, you can call [sbgst/hbgst](#) to solve the generalized eigenproblem $Az = \lambda Bz$, where A and B are banded and B is positive-definite.

Nonsymmetric Eigenvalue Problems

This section describes LAPACK routines for solving nonsymmetric eigenvalue problems, computing the Schur factorization of general matrices, as well as performing a number of related computational tasks.

A *nonsymmetric eigenvalue problem* is as follows: given a nonsymmetric (or non-Hermitian) matrix A , find the *eigenvalues* λ and the corresponding *eigenvectors* z that satisfy the equation

$$Az = \lambda z \text{ (right eigenvectors } z)$$

or the equation

$$z^H A = \lambda z^H \text{ (left eigenvectors } z).$$

Nonsymmetric eigenvalue problems have the following properties:

- The number of eigenvectors may be less than the matrix order (but is not less than the number of *distinct eigenvalues* of A).
- Eigenvalues may be complex even for a real matrix A .
- If a real nonsymmetric matrix has a complex eigenvalue $a+bi$ corresponding to an eigenvector z , then $a-bi$ is also an eigenvalue. The eigenvalue $a-bi$ corresponds to the eigenvector whose elements are complex conjugate to the elements of z .

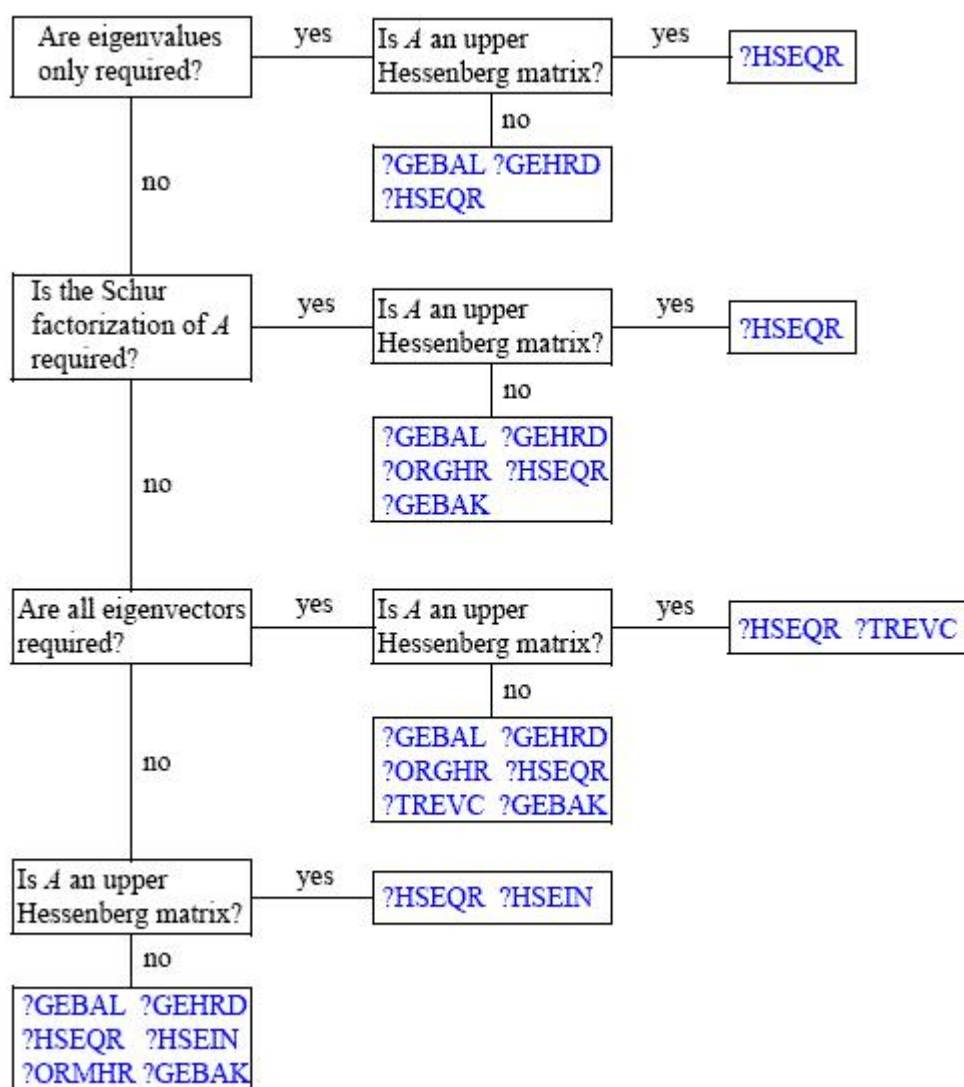

To solve a nonsymmetric eigenvalue problem with LAPACK, you usually need to reduce the matrix to the upper Hessenberg form and then solve the eigenvalue problem with the Hessenberg matrix obtained. [Table "Computational Routines for Solving Nonsymmetric Eigenvalue Problems"](#) lists LAPACK routines to reduce the matrix to the upper Hessenberg form by an orthogonal (or unitary) similarity transformation $A = QHQ^H$ as well as routines to solve eigenvalue problems with Hessenberg matrices, forming the Schur factorization of such matrices and computing the corresponding condition numbers. The corresponding routine names in the Fortran 95 interface are without the first symbol.

The decision tree in [Figure "Decision Tree: Real Nonsymmetric Eigenvalue Problems"](#) helps you choose the right routine or sequence of routines for an eigenvalue problem with a real nonsymmetric matrix. If you need to solve an eigenvalue problem with a complex non-Hermitian matrix, use the decision tree shown in [Figure "Decision Tree: Complex Non-Hermitian Eigenvalue Problems"](#).

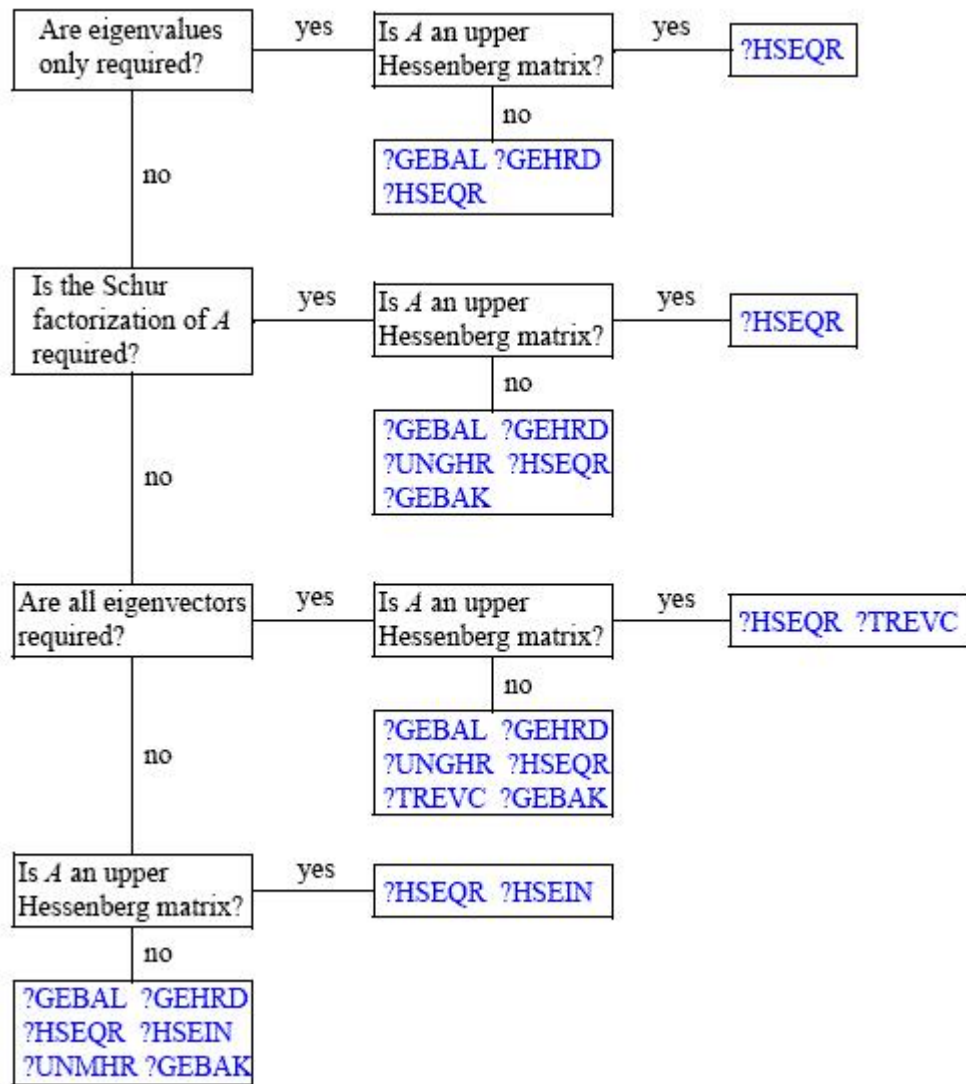

Computational Routines for Solving Nonsymmetric Eigenvalue Problems

Operation performed	Routines for real matrices	Routines for complex matrices
Reduce to Hessenberg form $A = QHQ^H$?gehrd ,	?gehrd
Generate the matrix Q	?orghr	?unghr
Apply the matrix Q	?ormhr	?unmhr
Balance matrix	?gebal	?gebal
Transform eigenvectors of balanced matrix to those of the original matrix	?gebak	?gebak
Find eigenvalues and Schur factorization (QR algorithm)	?hseqr	?hseqr
Find eigenvectors from Hessenberg form (inverse iteration)	?hsein	?hsein
Find eigenvectors from Schur factorization	?trevc	?trevc
Estimate sensitivities of eigenvalues and eigenvectors	?trsna	?trsna
Reorder Schur factorization	?trexc	?trexc
Reorder Schur factorization, find the invariant subspace and estimate sensitivities	?trsen	?trsen
Solves Sylvester's equation.	?trsyl	?trsyl

Decision Tree: Real Nonsymmetric Eigenvalue Problems

Decision Tree: Complex Non-Hermitian Eigenvalue Problems

?gehrd

Reduces a general matrix to upper Hessenberg form.

Syntax

```

call sgehrd(n, ilo, ihi, a, lda, tau, work, lwork, info)
call dgehrd(n, ilo, ihi, a, lda, tau, work, lwork, info)
call cgehrd(n, ilo, ihi, a, lda, tau, work, lwork, info)
call zgehrd(n, ilo, ihi, a, lda, tau, work, lwork, info)
call gehrd(a [, tau] [,ilo] [,ihi] [,info])
  
```

Include Files

- mkl.fi, lapack.f90

Description

The routine reduces a general matrix A to upper Hessenberg form H by an orthogonal or unitary similarity transformation $A = Q^* H^* Q^H$. Here H has real subdiagonal elements.

The routine does not form the matrix Q explicitly. Instead, Q is represented as a product of *elementary reflectors*. Routines are provided to work with Q in this representation.

Input Parameters

n	INTEGER. The order of the matrix A ($n \geq 0$).
ilo, ihi	INTEGER. If A is an output by <code>?gebal</code> , then ilo and ihi must contain the values returned by that routine. Otherwise $ilo = 1$ and $ihi = n$. (If $n > 0$, then $1 \leq ilo \leq ihi \leq n$; if $n = 0$, $ilo = 1$ and $ihi = 0$.)
$a, work$	<p>REAL for <code>sgehrd</code></p> <p>DOUBLE PRECISION for <code>dgehrd</code></p> <p>COMPLEX for <code>cgehrd</code></p> <p>DOUBLE COMPLEX for <code>zgehrd</code>.</p> <p>Arrays:</p> <p>$a(lda,*)$ contains the matrix A.</p> <p>The second dimension of a must be at least $\max(1, n)$.</p> <p>$work$ ($lwork$) is a workspace array.</p>
lda	INTEGER. The leading dimension of a ; at least $\max(1, n)$.
$lwork$	<p>INTEGER. The size of the $work$ array; at least $\max(1, n)$.</p> <p>If $lwork = -1$, then a workspace query is assumed; the routine only calculates the optimal size of the $work$ array, returns this value as the first entry of the $work$ array, and no error message related to $lwork$ is issued by xerbla.</p> <p>See <i>Application Notes</i> for the suggested value of $lwork$.</p>

Output Parameters

a	The elements on and above the subdiagonal contain the upper Hessenberg matrix H . The subdiagonal elements of H are real. The elements below the subdiagonal, with the array τ , represent the orthogonal matrix Q as a product of n elementary reflectors.
τ	<p>REAL for <code>sgehrd</code></p> <p>DOUBLE PRECISION for <code>dgehrd</code></p> <p>COMPLEX for <code>cgehrd</code></p> <p>DOUBLE COMPLEX for <code>zgehrd</code>.</p> <p>Array, size at least $\max(1, n-1)$.</p> <p>Contains scalars that define elementary reflectors for the matrix Q.</p>

work(1) If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

info INTEGER.
 If *info* = 0, the execution is successful.
 If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine *gehrd* interface are the following:

a Holds the matrix *A* of size (*n*,*n*).

tau Holds the vector of length (*n*-1).

ilo Default value for this argument is *ilo* = 1.

ihi Default value for this argument is *ihi* = *n*.

Application Notes

For better performance, try using *lwork* = *n***blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed Hessenberg matrix *H* is exactly similar to a nearby matrix $A + E$, where $\|E\|_2 < c(n)\epsilon \|A\|_2$, $c(n)$ is a modestly increasing function of *n*, and ϵ is the machine precision.

The approximate number of floating-point operations for real flavors is $(2/3) * (ihi - ilo)^2 (2ihi + 2ilo + 3n)$; for complex flavors it is 4 times greater.

?orghr

Generates the real orthogonal matrix Q determined by ?gehrd.

Syntax

```
call sorghr(n, ilo, ihi, a, lda, tau, work, lwork, info)
call dorghr(n, ilo, ihi, a, lda, tau, work, lwork, info)
call orghr(a, tau [,ilo] [,ihi] [,info])
```

Include Files

- `mkl.fi`, `lapack.f90`

Description

The routine explicitly generates the orthogonal matrix Q that has been determined by a preceding call to `sgehrd/dgehrd`. (The routine `?gehrd` reduces a real general matrix A to upper Hessenberg form H by an orthogonal similarity transformation, $A = Q^*H^*Q^T$, and represents the matrix Q as a product of $ihi-ilo$ elementary reflectors. Here ilo and ihi are values determined by `sgebal/dgebal` when balancing the matrix; if the matrix has not been balanced, $ilo = 1$ and $ihi = n$.)

The matrix Q generated by `?orghr` has the structure:

$$Q = \begin{bmatrix} I & 0 & 0 \\ 0 & Q_{22} & 0 \\ 0 & 0 & I \end{bmatrix}$$

where Q_{22} occupies rows and columns ilo to ihi .

Input Parameters

- n INTEGER. The order of the matrix Q ($n \geq 0$).
- ilo, ihi INTEGER. These must be the same parameters ilo and ihi , respectively, as supplied to `?gehrd`. (If $n > 0$, then $1 \leq ilo \leq ihi \leq n$; if $n = 0$, $ilo = 1$ and $ihi = 0$.)
- $a, tau, work$ REAL for `sorghr`
DOUBLE PRECISION for `dorghr`
Arrays: $a(lda,*)$ contains details of the vectors which define the elementary reflectors, as returned by `?gehrd`.
The second dimension of a must be at least $\max(1, n)$.
 $tau(*)$ contains further details of the elementary reflectors, as returned by `?gehrd`.
The dimension of tau must be at least $\max(1, n-1)$.
 $work$ is a workspace array, its dimension $\max(1, lwork)$.
- lda INTEGER. The leading dimension of a ; at least $\max(1, n)$.
- $lwork$ INTEGER. The size of the $work$ array;
 $lwork \geq \max(1, ihi-ilo)$.
If $lwork = -1$, then a workspace query is assumed; the routine only calculates the optimal size of the $work$ array, returns this value as the first entry of the $work$ array, and no error message related to $lwork$ is issued by [xerbla](#).

See *Application Notes* for the suggested value of $lwork$.

Output Parameters

<i>a</i>	Overwritten by the n -by- n orthogonal matrix Q .
<i>work</i> (1)	If <i>info</i> = 0, on exit <i>work</i> (1) contains the minimum value of <i>lwork</i> required for optimum performance. Use this <i>lwork</i> for subsequent runs.
<i>info</i>	INTEGER. If <i>info</i> = 0, the execution is successful. If <i>info</i> = - <i>i</i> , the <i>i</i> -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `orghr` interface are the following:

<i>a</i>	Holds the matrix A of size (n,n) .
<i>tau</i>	Holds the vector of length $(n-1)$.
<i>ilo</i>	Default value for this argument is <i>ilo</i> = 1.
<i>ihi</i>	Default value for this argument is <i>ihi</i> = n .

Application Notes

For better performance, try using $lwork = (ihi - ilo) * blocksize$ where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed matrix Q differs from the exact result by a matrix E such that $\|E\|_2 = O(\epsilon)$, where ϵ is the machine precision.

The approximate number of floating-point operations is $(4/3) (ihi - ilo)^3$.

The complex counterpart of this routine is [unghr](#).

?ormhr

Multiplies an arbitrary real matrix C by the real orthogonal matrix Q determined by ?gehrd.

Syntax

```
call sormhr(side, trans, m, n, ilo, ihi, a, lda, tau, c, ldc, work, lwork, info)
```

```
call dormhr(side, trans, m, n, ilo, ihi, a, lda, tau, c, ldc, work, lwork, info)
call ormhr(a, tau, c [,ilo] [,ihi] [,side] [,trans] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine multiplies a matrix C by the orthogonal matrix Q that has been determined by a preceding call to `sgehrd/dgehrd`. (The routine `?gehrd` reduces a real general matrix A to upper Hessenberg form H by an orthogonal similarity transformation, $A = Q^*H^*Q^T$, and represents the matrix Q as a product of *ihi-ilo* elementary reflectors. Here *ilo* and *ihi* are values determined by `sgebal/dgebal` when balancing the matrix; if the matrix has not been balanced, $ilo = 1$ and $ihi = n$.)

With `?ormhr`, you can form one of the matrix products Q^*C , Q^T*C , $C*Q$, or $C*Q^T$, overwriting the result on C (which may be any real rectangular matrix).

A common application of `?ormhr` is to transform a matrix V of eigenvectors of H to the matrix QV of eigenvectors of A .

Input Parameters

<i>side</i>	<p>CHARACTER*1. Must be 'L' or 'R'.</p> <p>If <i>side</i> = 'L', then the routine forms Q^*C or Q^T*C.</p> <p>If <i>side</i> = 'R', then the routine forms $C*Q$ or $C*Q^T$.</p>
<i>trans</i>	<p>CHARACTER*1. Must be 'N' or 'T'.</p> <p>If <i>trans</i> = 'N', then Q is applied to C.</p> <p>If <i>trans</i> = 'T', then Q^T is applied to C.</p>
<i>m</i>	INTEGER. The number of rows in C ($m \geq 0$).
<i>n</i>	INTEGER. The number of columns in C ($n \geq 0$).
<i>ilo, ihi</i>	<p>INTEGER. These must be the same parameters <i>ilo</i> and <i>ihi</i>, respectively, as supplied to <code>?gehrd</code>.</p> <p>If $m > 0$ and <i>side</i> = 'L', then $1 \leq ilo \leq ihi \leq m$.</p> <p>If $m = 0$ and <i>side</i> = 'L', then $ilo = 1$ and $ihi = 0$.</p> <p>If $n > 0$ and <i>side</i> = 'R', then $1 \leq ilo \leq ihi \leq n$.</p> <p>If $n = 0$ and <i>side</i> = 'R', then $ilo = 1$ and $ihi = 0$.</p>
<i>a, tau, c, work</i>	<p>REAL for <code>sormhr</code></p> <p>DOUBLE PRECISION for <code>dormhr</code></p> <p>Arrays:</p> <p><i>a</i>(<i>lda</i>,*) contains details of the vectors which define the <i>elementary reflectors</i>, as returned by <code>?gehrd</code>.</p> <p>The second dimension of <i>a</i> must be at least $\max(1, m)$ if <i>side</i> = 'L' and at least $\max(1, n)$ if <i>side</i> = 'R'.</p>

$\tau(*)$ contains further details of the *elementary reflectors*, as returned by `?gehrd`.

The dimension of τ must be at least $\max(1, m-1)$ if $side = 'L'$ and at least $\max(1, n-1)$ if $side = 'R'$.

$c(ldc,*)$ contains the m by n matrix C .

The second dimension of c must be at least $\max(1, n)$.

$work$ is a workspace array, its dimension $\max(1, lwork)$.

lda INTEGER. The leading dimension of a ; at least $\max(1, m)$ if $side = 'L'$ and at least $\max(1, n)$ if $side = 'R'$.

ldc INTEGER. The leading dimension of c ; at least $\max(1, m)$.

$lwork$ INTEGER. The size of the $work$ array.

If $side = 'L'$, $lwork \geq \max(1, n)$.

If $side = 'R'$, $lwork \geq \max(1, m)$.

If $lwork = -1$, then a workspace query is assumed; the routine only calculates the optimal size of the $work$ array, returns this value as the first entry of the $work$ array, and no error message related to $lwork$ is issued by [xerbla](#).

See *Application Notes* for the suggested value of $lwork$.

Output Parameters

c C is overwritten by product Q^*C , $Q^T C$, C^*Q , or C^*Q^T as specified by $side$ and $trans$.

$work(1)$ If $info = 0$, on exit $work(1)$ contains the minimum value of $lwork$ required for optimum performance. Use this $lwork$ for subsequent runs.

$info$ INTEGER.
If $info = 0$, the execution is successful.
If $info = -i$, the i -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `ormhr` interface are the following:

a Holds the matrix A of size (r,r) .
 $r = m$ if $side = 'L'$.
 $r = n$ if $side = 'R'$.

τ Holds the vector of length $(r-1)$.

c Holds the matrix C of size (m,n) .

<i>ilo</i>	Default value for this argument is <i>ilo</i> = 1.
<i>ihi</i>	Default value for this argument is <i>ihi</i> = <i>n</i> .
<i>side</i>	Must be 'L' or 'R'. The default value is 'L'.
<i>trans</i>	Must be 'N' or 'T'. The default value is 'N'.

Application Notes

For better performance, *lwork* should be at least $n \cdot \text{blocksize}$ if *side* = 'L' and at least $m \cdot \text{blocksize}$ if *side* = 'R', where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed matrix *Q* differs from the exact result by a matrix *E* such that $\|E\|_2 = O(\epsilon) \|C\|_2$, where ϵ is the machine precision.

The approximate number of floating-point operations is

$2n(ihi-ilo)^2$ if *side* = 'L';

$2m(ihi-ilo)^2$ if *side* = 'R'.

The complex counterpart of this routine is [unmhr](#).

?unghr

Generates the complex unitary matrix Q determined by ?gehrd.

Syntax

```
call cunghr(n, ilo, ihi, a, lda, tau, work, lwork, info)
call zunghr(n, ilo, ihi, a, lda, tau, work, lwork, info)
call unghr(a, tau [,ilo] [,ihi] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine is intended to be used following a call to *cgehrd/zgehrd*, which reduces a complex matrix *A* to upper Hessenberg form *H* by a unitary similarity transformation: $A = Q^* H Q^H$. *?gehrd* represents the matrix *Q* as a product of *ihi-ilo* elementary reflectors. Here *ilo* and *ihi* are values determined by *cgebal/zgebal* when balancing the matrix; if the matrix has not been balanced, *ilo* = 1 and *ihi* = *n*.

Use the routine [unghr](#) to generate *Q* explicitly as a square matrix. The matrix *Q* has the structure:

$$\begin{bmatrix} & & & & & & & & & \\ & & & & & & & & & \\ & & & & & & & & & \\ & & & & & & & & & \\ & & & & & & & & & \\ & & & & & & & & & \\ & & & & & & & & & \\ & & & & & & & & & \\ & & & & & & & & & \\ & & & & & & & & & \\ & & & & & & & & & \end{bmatrix}$$

where Q_{22} occupies rows and columns ilo to ihi .

Input Parameters

n	INTEGER. The order of the matrix Q ($n \geq 0$).
ilo, ihi	INTEGER. These must be the same parameters ilo and ihi , respectively, as supplied to <code>?gehrd</code> . (If $n > 0$, then $1 \leq ilo \leq ihi \leq n$. If $n = 0$, then $ilo = 1$ and $ihi = 0$.)
$a, tau, work$	COMPLEX for <code>cunghr</code> DOUBLE COMPLEX for <code>zunghr</code> . Arrays: $a(lda,*)$ contains details of the vectors which define the <i>elementary reflectors</i> , as returned by <code>?gehrd</code> . The second dimension of a must be at least $\max(1, n)$. $tau(*)$ contains further details of the <i>elementary reflectors</i> , as returned by <code>?gehrd</code> . The dimension of tau must be at least $\max(1, n-1)$. $work$ is a workspace array, its dimension $\max(1, lwork)$.
lda	INTEGER. The leading dimension of a ; at least $\max(1, n)$.
$lwork$	INTEGER. The size of the $work$ array; $lwork \geq \max(1, ihi-ilo)$. If $lwork = -1$, then a workspace query is assumed; the routine only calculates the optimal size of the $work$ array, returns this value as the first entry of the $work$ array, and no error message related to $lwork$ is issued by xerbla . See <i>Application Notes</i> for the suggested value of $lwork$.

Output Parameters

a	Overwritten by the n -by- n unitary matrix Q .
$work(1)$	If $info = 0$, on exit $work(1)$ contains the minimum value of $lwork$ required for optimum performance. Use this $lwork$ for subsequent runs.
$info$	INTEGER. If $info = 0$, the execution is successful. If $info = -i$, the i -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `unghr` interface are the following:

<code>a</code>	Holds the matrix A of size (n,n) .
<code>tau</code>	Holds the vector of length $(n-1)$.
<code>ilo</code>	Default value for this argument is <code>ilo = 1</code> .
<code>ihi</code>	Default value for this argument is <code>ihi = n</code> .

Application Notes

For better performance, try using `lwork = (ihi-ilo)*blocksize`, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set `lwork = -1`.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (`work(1)`) for subsequent runs.

If `lwork = -1`, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed matrix Q differs from the exact result by a matrix E such that $\|E\|_2 = O(\epsilon)$, where ϵ is the machine precision.

The approximate number of real floating-point operations is $(16/3)(ihi-ilo)^3$.

The real counterpart of this routine is [orghr](#).

?unmhr

Multiplies an arbitrary complex matrix C by the complex unitary matrix Q determined by ?gehrd.

Syntax

```
call cunmhr(side, trans, m, n, ilo, ihi, a, lda, tau, c, ldc, work, lwork, info)
call zunmhr(side, trans, m, n, ilo, ihi, a, lda, tau, c, ldc, work, lwork, info)
call unmhr(a, tau, c [,ilo] [,ihi] [,side] [,trans] [,info])
```

Include Files

- `mkl.fi`, `lapack.f90`

Description

The routine multiplies a matrix C by the unitary matrix Q that has been determined by a preceding call to `cgehrd/zgehrd`. (The routine `?gehrd` reduces a real general matrix A to upper Hessenberg form H by an orthogonal similarity transformation, $A = Q^H H Q$, and represents the matrix Q as a product of *ihi-ilo elementary reflectors*. Here *ilo* and *ihi* are values determined by `cgebal/zgebal` when balancing the matrix; if the matrix has not been balanced, $ilo = 1$ and $ihi = n$.)

With `?unmhr`, you can form one of the matrix products $Q^H C$, $Q^H C$, $C^H Q$, or $C^H Q^H$, overwriting the result on C (which may be any complex rectangular matrix). A common application of this routine is to transform a matrix V of eigenvectors of H to the matrix QV of eigenvectors of A .

Input Parameters

<i>side</i>	<p>CHARACTER*1. Must be 'L' or 'R'.</p> <p>If <i>side</i> = 'L', then the routine forms $Q^H C$ or $Q^H C$.</p> <p>If <i>side</i> = 'R', then the routine forms $C^H Q$ or $C^H Q^H$.</p>
<i>trans</i>	<p>CHARACTER*1. Must be 'N' or 'C'.</p> <p>If <i>trans</i> = 'N', then Q is applied to C.</p> <p>If <i>trans</i> = 'T', then Q^H is applied to C.</p>
<i>m</i>	INTEGER. The number of rows in C ($m \geq 0$).
<i>n</i>	INTEGER. The number of columns in C ($n \geq 0$).
<i>ilo, ihi</i>	<p>INTEGER. These must be the same parameters <i>ilo</i> and <i>ihi</i>, respectively, as supplied to <code>?gehrd</code>.</p> <p>If $m > 0$ and <i>side</i> = 'L', then $1 \leq ilo \leq ihi \leq m$.</p> <p>If $m = 0$ and <i>side</i> = 'L', then $ilo = 1$ and $ihi = 0$.</p> <p>If $n > 0$ and <i>side</i> = 'R', then $1 \leq ilo \leq ihi \leq n$.</p> <p>If $n = 0$ and <i>side</i> = 'R', then $ilo = 1$ and $ihi = 0$.</p>
<i>a, tau, c, work</i>	<p>COMPLEX for <code>cunmhr</code></p> <p>DOUBLE COMPLEX for <code>zunmhr</code>.</p> <p>Arrays:</p> <p><i>a(lda,*)</i> contains details of the vectors which define the elementary reflectors, as returned by <code>?gehrd</code>.</p> <p>The second dimension of <i>a</i> must be at least $\max(1, m)$ if <i>side</i> = 'L' and at least $\max(1, n)$ if <i>side</i> = 'R'.</p> <p><i>tau(*)</i> contains further details of the elementary reflectors, as returned by <code>?gehrd</code>.</p> <p>The dimension of <i>tau</i> must be at least $\max(1, m-1)$</p> <p>if <i>side</i> = 'L' and at least $\max(1, n-1)$ if <i>side</i> = 'R'.</p> <p><i>c ldc,*)</i> contains the m-by-n matrix C.</p> <p>The second dimension of <i>c</i> must be at least $\max(1, n)$.</p> <p><i>work</i> is a workspace array, its dimension $\max(1, lwork)$.</p>

<i>lda</i>	INTEGER. The leading dimension of <i>a</i> ; at least $\max(1, m)$ if <i>side</i> = 'L' and at least $\max(1, n)$ if <i>side</i> = 'R'.
<i>ldc</i>	INTEGER. The leading dimension of <i>c</i> ; at least $\max(1, m)$.
<i>lwork</i>	<p>INTEGER. The size of the <i>work</i> array.</p> <p>If <i>side</i> = 'L', $lwork \geq \max(1, n)$.</p> <p>If <i>side</i> = 'R', $lwork \geq \max(1, m)$.</p> <p>If <i>lwork</i> = -1, then a workspace query is assumed; the routine only calculates the optimal size of the <i>work</i> array, returns this value as the first entry of the <i>work</i> array, and no error message related to <i>lwork</i> is issued by xerbla.</p> <p>See <i>Application Notes</i> for the suggested value of <i>lwork</i>.</p>

Output Parameters

<i>c</i>	<i>C</i> is overwritten by Q^*C , or $Q^H C$, or $C Q^H$, or C^*Q as specified by <i>side</i> and <i>trans</i> .
<i>work</i> (1)	If <i>info</i> = 0, on exit <i>work</i> (1) contains the minimum value of <i>lwork</i> required for optimum performance. Use this <i>lwork</i> for subsequent runs.
<i>info</i>	<p>INTEGER.</p> <p>If <i>info</i> = 0, the execution is successful.</p> <p>If <i>info</i> = -<i>i</i>, the <i>i</i>-th parameter had an illegal value.</p>

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `unmhr` interface are the following:

<i>a</i>	<p>Holds the matrix <i>A</i> of size (<i>r</i>,<i>r</i>).</p> <p>$r = m$ if <i>side</i> = 'L'.</p> <p>$r = n$ if <i>side</i> = 'R'.</p>
<i>tau</i>	Holds the vector of length (<i>r</i> -1).
<i>c</i>	Holds the matrix <i>C</i> of size (<i>m</i> , <i>n</i>).
<i>ilo</i>	Default value for this argument is <i>ilo</i> = 1.
<i>ihi</i>	Default value for this argument is <i>ihi</i> = <i>n</i> .
<i>side</i>	Must be 'L' or 'R'. The default value is 'L'.
<i>trans</i>	Must be 'N' or 'C'. The default value is 'N'.

<i>scale</i>	<p>REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors</p> <p>Array, size at least $\max(1, n)$.</p> <p>Contains details of the permutations and scaling factors.</p> <p>More precisely, if p_j is the index of the row and column interchanged with row and column j, and d_j is the scaling factor used to balance row and column j, then</p> <p>$scale(j) = p_j$ for $j = 1, 2, \dots, ilo-1, ihi+1, \dots, n$;</p> <p>$scale(j) = d_j$ for $j = ilo, ilo + 1, \dots, ihi$.</p> <p>The order in which the interchanges are made is n to $ihi+1$, then 1 to $ilo-1$.</p>
<i>info</i>	<p>INTEGER.</p> <p>If $info = 0$, the execution is successful.</p> <p>If $info = -i$, the i-th parameter had an illegal value.</p>

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `gebak` interface are the following:

<i>a</i>	Holds the matrix A of size (n,n) .
<i>scale</i>	Holds the vector of length n .
<i>ilo</i>	Default value for this argument is $ilo = 1$.
<i>ihi</i>	Default value for this argument is $ihi = n$.
<i>job</i>	Must be 'B', 'S', 'P', or 'N'. The default value is 'B'.

Application Notes

The errors are negligible, compared with those in subsequent computations.

If the matrix A is balanced by this routine, then any eigenvectors computed subsequently are eigenvectors of the matrix A'' and hence you must call [gebak](#) to transform them back to eigenvectors of A .

If the Schur vectors of A are required, do not call this routine with $job = 'S'$ or $'B'$, because then the balancing transformation is not orthogonal (not unitary for complex flavors).

If you call this routine with $job = 'P'$, then any Schur vectors computed subsequently are Schur vectors of the matrix A'' , and you need to call [gebak](#) (with $side = 'R'$) to transform them back to Schur vectors of A .

The total number of floating-point operations is proportional to n^2 .

?gebak

Transforms eigenvectors of a balanced matrix to those of the original nonsymmetric matrix.

Syntax

```
call sgebak(job, side, n, ilo, ihi, scale, m, v, ldv, info)
call dgebak(job, side, n, ilo, ihi, scale, m, v, ldv, info)
```

```
call cgebak(job, side, n, ilo, ihi, scale, m, v, ldv, info)
call zgebak(job, side, n, ilo, ihi, scale, m, v, ldv, info)
call gebak(v, scale [,ilo] [,ihi] [,job] [,side] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine is intended to be used after a matrix A has been balanced by a call to `?gebal`, and eigenvectors of the balanced matrix A''_{22} have subsequently been computed. For a description of balancing, see [gebal](#). The balanced matrix A'' is obtained as $A'' = D * P * A * P^T * \text{inv}(D)$, where P is a permutation matrix and D is a diagonal scaling matrix. This routine transforms the eigenvectors as follows:

if x is a right eigenvector of A'' , then $P^T * \text{inv}(D) * x$ is a right eigenvector of A ; if y is a left eigenvector of A'' , then $P^T * D * y$ is a left eigenvector of A .

Input Parameters

<i>job</i>	CHARACTER*1. Must be 'N' or 'P' or 'S' or 'B'. The same parameter <i>job</i> as supplied to <code>?gebal</code> .
<i>side</i>	CHARACTER*1. Must be 'L' or 'R'. If <i>side</i> = 'L', then left eigenvectors are transformed. If <i>side</i> = 'R', then right eigenvectors are transformed.
<i>n</i>	INTEGER. The number of rows of the matrix of eigenvectors ($n \geq 0$).
<i>ilo, ihi</i>	INTEGER. The values <i>ilo</i> and <i>ihi</i> , as returned by <code>?gebal</code> . (If $n > 0$, then $1 \leq ilo \leq ihi \leq n$; if $n = 0$, then $ilo = 1$ and $ihi = 0$.)
<i>scale</i>	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors Array, size at least $\max(1, n)$. Contains details of the permutations and/or the scaling factors used to balance the original general matrix, as returned by <code>?gebal</code> .
<i>m</i>	INTEGER. The number of columns of the matrix of eigenvectors ($m \geq 0$).
<i>v</i>	REAL for sgebak DOUBLE PRECISION for dgebak COMPLEX for cgebak DOUBLE COMPLEX for zgebak. Arrays: $v(ldv,*)$ contains the matrix of left or right eigenvectors to be transformed. The second dimension of v must be at least $\max(1, m)$.
<i>ldv</i>	INTEGER. The leading dimension of v ; at least $\max(1, n)$.

Output Parameters

<code>v</code>	Overwritten by the transformed eigenvectors.
<code>info</code>	INTEGER. If <code>info = 0</code> , the execution is successful. If <code>info = -i</code> , the <i>i</i> -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `gebak` interface are the following:

<code>v</code>	Holds the matrix V of size (n,m) .
<code>scale</code>	Holds the vector of length n .
<code>ilo</code>	Default value for this argument is <code>ilo = 1</code> .
<code>ihi</code>	Default value for this argument is <code>ihi = n</code> .
<code>job</code>	Must be 'B', 'S', 'P', or 'N'. The default value is 'B'.
<code>side</code>	Must be 'L' or 'R'. The default value is 'L'.

Application Notes

The errors in this routine are negligible.

The approximate number of floating-point operations is approximately proportional to $m \cdot n$.

?hseqr

Computes all eigenvalues and (optionally) the Schur factorization of a matrix reduced to Hessenberg form.

Syntax

```
call shseqr(job, compz, n, ilo, ihi, h, ldh, wr, wi, z, ldz, work, lwork, info)
call dhseqr(job, compz, n, ilo, ihi, h, ldh, wr, wi, z, ldz, work, lwork, info)
call chseqr(job, compz, n, ilo, ihi, h, ldh, w, z, ldz, work, lwork, info)
call zhseqr(job, compz, n, ilo, ihi, h, ldh, w, z, ldz, work, lwork, info)
call hseqr(h, wr, wi [,ilo] [,ihi] [,z] [,job] [,compz] [,info])
call hseqr(h, w [,ilo] [,ihi] [,z] [,job] [,compz] [,info])
```

Include Files

- `mkl.fi`, `lapack.f90`

Description

The routine computes all the eigenvalues, and optionally the Schur factorization, of an upper Hessenberg matrix H : $H = Z^* T^* Z^H$, where T is an upper triangular (or, for real flavors, quasi-triangular) matrix (the Schur form of H), and Z is the unitary or orthogonal matrix whose columns are the Schur vectors z_i .

You can also use this routine to compute the Schur factorization of a general matrix A which has been reduced to upper Hessenberg form H :

$A = Q^* H^* Q^H$, where Q is unitary (orthogonal for real flavors);

$A = (QZ)^* T^* (QZ)^H$.

In this case, after reducing A to Hessenberg form by `gehrd`, call `orghr` to form Q explicitly and then pass Q to `?hseqr` with `compz = 'V'`.

You can also call `gebal` to balance the original matrix before reducing it to Hessenberg form by `?hseqr`, so that the Hessenberg matrix H will have the structure:

$$\begin{bmatrix} H_{11} & H_{12} & H_{13} \\ 0 & H_{22} & H_{23} \\ 0 & 0 & H_{33} \end{bmatrix}$$

where H_{11} and H_{33} are upper triangular.

If so, only the central diagonal block H_{22} (in rows and columns ilo to ihi) needs to be further reduced to Schur form (the blocks H_{12} and H_{23} are also affected). Therefore the values of ilo and ihi can be supplied to `?hseqr` directly. Also, after calling this routine you must call `gebak` to permute the Schur vectors of the balanced matrix to those of the original matrix.

If `?gebal` has not been called, however, then ilo must be set to 1 and ihi to n . Note that if the Schur factorization of A is required, `?gebal` must not be called with `job = 'S'` or `'B'`, because the balancing transformation is not unitary (for real flavors, it is not orthogonal).

`?hseqr` uses a multishift form of the upper Hessenberg QR algorithm. The Schur vectors are normalized so that $\|z_i\|_2 = 1$, but are determined only to within a complex factor of absolute value 1 (for the real flavors, to within a factor ± 1).

Input Parameters

<code>job</code>	CHARACTER*1. Must be 'E' or 'S'. If <code>job = 'E'</code> , then eigenvalues only are required. If <code>job = 'S'</code> , then the Schur form T is required.
<code>compz</code>	CHARACTER*1. Must be 'N' or 'I' or 'V'. If <code>compz = 'N'</code> , then no Schur vectors are computed (and the array z is not referenced). If <code>compz = 'I'</code> , then the Schur vectors of H are computed (and the array z is initialized by the routine). If <code>compz = 'V'</code> , then the Schur vectors of A are computed (and the array z must contain the matrix Q on entry).
<code>n</code>	INTEGER. The order of the matrix H ($n \geq 0$).
<code>ilo, ihi</code>	INTEGER. If A has been balanced by <code>?gebal</code> , then <code>ilo</code> and <code>ihi</code> must contain the values returned by <code>?gebal</code> . Otherwise, <code>ilo</code> must be set to 1 and <code>ihi</code> to n .
<code>h, z, work</code>	REAL for shseqr

DOUBLE PRECISION for dhseqr

COMPLEX for chseqr

DOUBLE COMPLEX for zhseqr.

Arrays:

$h(ldh,*)$) The n -by- n upper Hessenberg matrix H .

The second dimension of h must be at least $\max(1, n)$.

$z(ldz,*)$

If $compz = 'V'$, then z must contain the matrix Q from the reduction to Hessenberg form.

If $compz = 'I'$, then z need not be set.

If $compz = 'N'$, then z is not referenced.

The second dimension of z must be

at least $\max(1, n)$ if $compz = 'V'$ or $'I'$;

at least 1 if $compz = 'N'$.

$work(lwork)$ is a workspace array.

The dimension of $work$ must be at least $\max(1, n)$.

ldh

INTEGER. The leading dimension of h ; at least $\max(1, n)$.

ldz

INTEGER. The leading dimension of z ;

If $compz = 'N'$, then $ldz \geq 1$.

If $compz = 'V'$ or $'I'$, then $ldz \geq \max(1, n)$.

$lwork$

INTEGER. The dimension of the array $work$.

$lwork \geq \max(1, n)$ is sufficient and delivers very good and sometimes optimal performance. However, $lwork$ as large as $11*n$ may be required for optimal performance. A workspace query is recommended to determine the optimal workspace size.

If $lwork = -1$, then a workspace query is assumed; the routine only estimates the optimal size of the $work$ array, returns this value as the first entry of the $work$ array, and no error message related to $lwork$ is issued by [xerbla](#). See *Application Notes* for details.

Output Parameters

w

COMPLEX for chseqr

DOUBLE COMPLEX for zhseqr.

Array, size at least $\max(1, n)$. Contains the computed eigenvalues, unless $info > 0$. The eigenvalues are stored in the same order as on the diagonal of the Schur form T (if computed).

wr, wi

REAL for shseqr

DOUBLE PRECISION for dhseqr

Arrays, size at least $\max(1, n)$ each.

Contain the real and imaginary parts, respectively, of the computed eigenvalues, unless *info* > 0. Complex conjugate pairs of eigenvalues appear consecutively with the eigenvalue having positive imaginary part first. The eigenvalues are stored in the same order as on the diagonal of the Schur form *T* (if computed).

<i>h</i>	<p>If <i>info</i> = 0 and <i>job</i> = 'S', <i>h</i> contains the upper quasi-triangular matrix <i>T</i> from the Schur decomposition (the Schur form).</p> <p>If <i>info</i> = 0 and <i>job</i> = 'E', the contents of <i>h</i> are unspecified on exit. (The output value of <i>h</i> when <i>info</i> > 0 is given under the description of <i>info</i> below.)</p>
<i>z</i>	<p>If <i>compz</i> = 'V' and <i>info</i> = 0, then <i>z</i> contains Q^*Z.</p> <p>If <i>compz</i> = 'I' and <i>info</i> = 0, then <i>z</i> contains the unitary or orthogonal matrix <i>Z</i> of the Schur vectors of <i>H</i>.</p> <p>If <i>compz</i> = 'N', then <i>z</i> is not referenced.</p>
<i>work</i> (1)	On exit, if <i>info</i> = 0, then <i>work</i> (1) returns the optimal <i>lwork</i> .
<i>info</i>	<p>INTEGER.</p> <p>If <i>info</i> = 0, the execution is successful.</p> <p>If <i>info</i> = -<i>i</i>, the <i>i</i>-th parameter had an illegal value.</p> <p>If <i>info</i> = <i>i</i>, <i>hseqr</i> failed to compute all of the eigenvalues. Elements 1, 2, ..., <i>ilo</i>-1 and <i>i</i>+1, <i>i</i>+2, ..., <i>n</i> of the eigenvalue arrays (<i>wr</i> and <i>wi</i> for real flavors and <i>w</i> for complex flavors) contain the real and imaginary parts of those eigenvalues that have been successfully found.</p> <p>If <i>info</i> > 0, and <i>job</i> = 'E', then on exit, the remaining unconverged eigenvalues are the eigenvalues of the upper Hessenberg matrix rows and columns <i>ilo</i> through <i>info</i> of the final output value of <i>H</i>.</p> <p>If <i>info</i> > 0, and <i>job</i> = 'S', then on exit (initial value of <i>H</i>)*<i>U</i> = <i>U</i>*(final value of <i>H</i>), where <i>U</i> is a unitary matrix. The final value of <i>H</i> is upper Hessenberg and triangular in rows and columns <i>info</i>+1 through <i>ihi</i>.</p> <p>If <i>info</i> > 0, and <i>compz</i> = 'V', then on exit (final value of <i>Z</i>) = (initial value of <i>Z</i>)*<i>U</i>, where <i>U</i> is the unitary matrix (regardless of the value of <i>job</i>).</p> <p>If <i>info</i> > 0, and <i>compz</i> = 'I', then on exit (final value of <i>Z</i>) = <i>U</i>, where <i>U</i> is the unitary matrix (regardless of the value of <i>job</i>).</p> <p>If <i>info</i> > 0, and <i>compz</i> = 'N', then <i>Z</i> is not accessed.</p>

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `hseqr` interface are the following:

<i>h</i>	Holds the matrix <i>H</i> of size (<i>n</i> , <i>n</i>).
<i>wr</i>	Holds the vector of length <i>n</i> . Used in real flavors only.

<i>wi</i>	Holds the vector of length <i>n</i> . Used in real flavors only.
<i>w</i>	Holds the vector of length <i>n</i> . Used in complex flavors only.
<i>z</i>	Holds the matrix <i>Z</i> of size (<i>n</i> , <i>n</i>).
<i>job</i>	Must be 'E' or 'S'. The default value is 'E'.
<i>compz</i>	<p>If omitted, this argument is restored based on the presence of argument <i>z</i> as follows: <i>compz</i> = 'I', if <i>z</i> is present, <i>compz</i> = 'N', if <i>z</i> is omitted.</p> <p>If present, <i>compz</i> must be equal to 'I' or 'V' and the argument <i>z</i> must also be present. Note that there will be an error condition if <i>compz</i> is present and <i>z</i> omitted.</p>

Application Notes

The computed Schur factorization is the exact factorization of a nearby matrix $H + E$, where $\|E\|_2 < O(\epsilon) \|H\|_2 / s_i$, and ϵ is the machine precision.

If λ_i is an exact eigenvalue, and μ_i is the corresponding computed value, then $|\lambda_i - \mu_i| \leq c(n) * \epsilon * \|H\|_2 / s_i$, where $c(n)$ is a modestly increasing function of *n*, and s_i is the reciprocal condition number of λ_i . The condition numbers s_i may be computed by calling [trsna](#).

The total number of floating-point operations depends on how rapidly the algorithm converges; typical numbers are as follows.

If only eigenvalues are computed:	<p>$7n^3$ for real flavors</p> <p>$25n^3$ for complex flavors.</p>
If the Schur form is computed:	<p>$10n^3$ for real flavors</p> <p>$35n^3$ for complex flavors.</p>
If the full Schur factorization is computed:	<p>$20n^3$ for real flavors</p> <p>$70n^3$ for complex flavors.</p>

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?hsein

Computes selected eigenvectors of an upper Hessenberg matrix that correspond to specified eigenvalues.

Syntax

```
call shsein(side, eigsrc, initv, select, n, h, ldh, wr, wi, vl, ldvl, vr, ldvr, mm,
m, work, ifaill, ifailr, info)
```

```

call dhsein(side, eigsrc, initv, select, n, h, ldh, wr, wi, vl, ldvl, vr, ldvr, mm,
m, work, ifaill, ifailr, info)

call chsein(side, eigsrc, initv, select, n, h, ldh, w, vl, ldvl, vr, ldvr, mm, m,
work, rwork, ifaill, ifailr, info)

call zhsein(side, eigsrc, initv, select, n, h, ldh, w, vl, ldvl, vr, ldvr, mm, m,
work, rwork, ifaill, ifailr, info)

call hsein(h, wr, wi, select [, vl] [,vr] [,ifaill] [,ifailr] [,initv] [,eigsrc] [,m]
[,info])

call hsein(h, w, select [,vl] [,vr] [,ifaill] [,ifailr] [,initv] [,eigsrc] [,m] [,info])

```

Include Files

- `mkl.fi`, `lapack.f90`

Description

The routine computes left and/or right eigenvectors of an upper Hessenberg matrix H , corresponding to selected eigenvalues.

The right eigenvector x and the left eigenvector y , corresponding to an eigenvalue λ , are defined by: $H^*x = \lambda^*x$ and $y^H H = \lambda^* y^H$ (or $H^H y = \lambda^* y$). Here λ^* denotes the conjugate of λ .

The eigenvectors are computed by inverse iteration. They are scaled so that, for a real eigenvector x , $\max |x_i| = 1$, and for a complex eigenvector, $\max(|\text{Re}x_i| + |\text{Im}x_i|) = 1$.

If H has been formed by reduction of a general matrix A to upper Hessenberg form, then eigenvectors of H may be transformed to eigenvectors of A by [ormhr](#) or [unmhr](#).

Input Parameters

<i>side</i>	<p>CHARACTER*1. Must be 'R' or 'L' or 'B'.</p> <p>If <i>side</i> = 'R', then only right eigenvectors are computed.</p> <p>If <i>side</i> = 'L', then only left eigenvectors are computed.</p> <p>If <i>side</i> = 'B', then all eigenvectors are computed.</p>
<i>eigsrc</i>	<p>CHARACTER*1. Must be 'Q' or 'N'.</p> <p>If <i>eigsrc</i> = 'Q', then the eigenvalues of H were found using hseqr; thus if H has any zero sub-diagonal elements (and so is block triangular), then the j-th eigenvalue can be assumed to be an eigenvalue of the block containing the j-th row/column. This property allows the routine to perform inverse iteration on just one diagonal block. If <i>eigsrc</i> = 'N', then no such assumption is made and the routine performs inverse iteration using the whole matrix.</p>
<i>initv</i>	<p>CHARACTER*1. Must be 'N' or 'U'.</p> <p>If <i>initv</i> = 'N', then no initial estimates for the selected eigenvectors are supplied.</p> <p>If <i>initv</i> = 'U', then initial estimates for the selected eigenvectors are supplied in <i>vl</i> and/or <i>vr</i>.</p>
<i>select</i>	<p>LOGICAL.</p>

Array, size at least $\max(1, n)$. Specifies which eigenvectors are to be computed.

For real flavors:

To obtain the real eigenvector corresponding to the real eigenvalue $wr(j)$, set $select(j)$ to `.TRUE.`

To select the complex eigenvector corresponding to the complex eigenvalue $(wr(j), wi(j))$ with complex conjugate $(wr(j+1), wi(j+1))$, set $select(j)$ and/or $select(j+1)$ to `.TRUE.`; the eigenvector corresponding to the first eigenvalue in the pair is computed.

For complex flavors:

To select the eigenvector corresponding to the eigenvalue $w(j)$, set $select(j)$ to `.TRUE.`

n

INTEGER. The order of the matrix H ($n \geq 0$).

$h, vl, vr, work$

REAL for shsein

DOUBLE PRECISION for dhsein

COMPLEX for chsein

DOUBLE COMPLEX for zhsein.

Arrays:

$h(ldh,*)$ The n -by- n upper Hessenberg matrix H . If an `NAN` value is detected in h , the routine returns with $info = -6$.

The second dimension of h must be at least $\max(1, n)$.

$vl(ldvl,*)$

If $initv = 'V'$ and $side = 'L'$ or $'B'$, then vl must contain starting vectors for inverse iteration for the left eigenvectors. Each starting vector must be stored in the same column or columns as will be used to store the corresponding eigenvector.

If $initv = 'N'$, then vl need not be set.

The second dimension of vl must be at least $\max(1, mm)$ if $side = 'L'$ or $'B'$ and at least 1 if $side = 'R'$.

The array vl is not referenced if $side = 'R'$.

$vr(ldvr,*)$

If $initv = 'V'$ and $side = 'R'$ or $'B'$, then vr must contain starting vectors for inverse iteration for the right eigenvectors. Each starting vector must be stored in the same column or columns as will be used to store the corresponding eigenvector.

If $initv = 'N'$, then vr need not be set.

The second dimension of vr must be at least $\max(1, mm)$ if $side = 'R'$ or $'B'$ and at least 1 if $side = 'L'$.

The array vr is not referenced if $side = 'L'$.

$work(*)$ is a workspace array.

size at least $\max(1, n*(n+2))$ for real flavors and at least $\max(1, n*n)$ for complex flavors.

<i>ldh</i>	INTEGER. The leading dimension of <i>h</i> ; at least $\max(1, n)$.
<i>w</i>	COMPLEX for <i>chsein</i> DOUBLE COMPLEX for <i>zhsein</i> . Array, size at least $\max(1, n)$. Contains the eigenvalues of the matrix <i>H</i> . If <i>eigsrc</i> = 'Q', the array must be exactly as returned by ?hseqr.
<i>wr, wi</i>	REAL for <i>shsein</i> DOUBLE PRECISION for <i>dhsein</i> Arrays, size at least $\max(1, n)$ each. Contain the real and imaginary parts, respectively, of the eigenvalues of the matrix <i>H</i> . Complex conjugate pairs of values must be stored in consecutive elements of the arrays. If <i>eigsrc</i> = 'Q', the arrays must be exactly as returned by ?hseqr.
<i>ldvl</i>	INTEGER. The leading dimension of <i>vl</i> . If <i>side</i> = 'L' or 'B', $ldvl \geq \max(1, n)$. If <i>side</i> = 'R', $ldvl \geq 1$.
<i>ldvr</i>	INTEGER. The leading dimension of <i>vr</i> . If <i>side</i> = 'R' or 'B', $ldvr \geq \max(1, n)$. If <i>side</i> = 'L', $ldvr \geq 1$.
<i>mm</i>	INTEGER. The number of columns in <i>vl</i> and/or <i>vr</i> . Must be at least <i>m</i> , the actual number of columns required (see <i>Output Parameters</i> below). For real flavors, <i>m</i> is obtained by counting 1 for each selected real eigenvector and 2 for each selected complex eigenvector (see <i>select</i>). For complex flavors, <i>m</i> is the number of selected eigenvectors (see <i>select</i>). Constraint: $0 \leq mm \leq n$.
<i>rwork</i>	REAL for <i>chsein</i> DOUBLE PRECISION for <i>zhsein</i> . Array, size at least $\max(1, n)$.

Output Parameters

<i>select</i>	Overwritten for real flavors only. If a complex eigenvector was selected as specified above, then <i>select(j)</i> is set to .TRUE. and <i>select(j + 1)</i> to .FALSE.
<i>w</i>	The real parts of some elements of <i>w</i> may be modified, as close eigenvalues are perturbed slightly in searching for independent eigenvectors.

<i>wr</i>	Some elements of <i>wr</i> may be modified, as close eigenvalues are perturbed slightly in searching for independent eigenvectors.
<i>vl</i> , <i>vr</i>	<p>If <i>side</i> = 'L' or 'B', <i>vl</i> contains the computed left eigenvectors (as specified by <i>select</i>).</p> <p>If <i>side</i> = 'R' or 'B', <i>vr</i> contains the computed right eigenvectors (as specified by <i>select</i>).</p> <p>The eigenvectors treated column-wise form a rectangular <i>n</i>-by-<i>mm</i> matrix.</p> <p><i>For real flavors</i>: a real eigenvector corresponding to a real eigenvalue occupies one column of the matrix; a complex eigenvector corresponding to a complex eigenvalue occupies two columns: the first column holds the real part of the eigenvector and the second column holds the imaginary part of the eigenvector. The matrix is stored in a one-dimensional array as described by <i>matrix_layout</i> (using either column major or row major layout).</p>
<i>m</i>	<p>INTEGER. <i>For real flavors</i>: the number of columns of <i>vl</i> and/or <i>vr</i> required to store the selected eigenvectors.</p> <p><i>For complex flavors</i>: the number of selected eigenvectors.</p>
<i>ifaill</i> , <i>ifailr</i>	<p>INTEGER.</p> <p>Arrays, size at least max(1, <i>mm</i>) each.</p> <p><i>ifaill</i>(<i>i</i>) = 0 if the <i>i</i>th column of <i>vl</i> converged;</p> <p><i>ifaill</i>(<i>i</i>) = <i>j</i> > 0 if the eigenvector stored in the <i>i</i>-th column of <i>vl</i> (corresponding to the <i>j</i>th eigenvalue) failed to converge.</p> <p><i>ifailr</i>(<i>i</i>) = 0 if the <i>i</i>th column of <i>vr</i> converged;</p> <p><i>ifailr</i>(<i>i</i>) = <i>j</i> > 0 if the eigenvector stored in the <i>i</i>-th column of <i>vr</i> (corresponding to the <i>j</i>th eigenvalue) failed to converge.</p> <p><i>For real flavors</i>: if the <i>i</i>th and (<i>i</i>+1)th columns of <i>vl</i> contain a selected complex eigenvector, then <i>ifaill</i>(<i>i</i>) and <i>ifaill</i>(<i>i</i> + 1) are set to the same value. A similar rule holds for <i>vr</i> and <i>ifailr</i>.</p> <p>The array <i>ifaill</i> is not referenced if <i>side</i> = 'R'. The array <i>ifailr</i> is not referenced if <i>side</i> = 'L'.</p>
<i>info</i>	<p>INTEGER.</p> <p>If <i>info</i> = 0, the execution is successful.</p> <p>If <i>info</i> = -<i>i</i>, the <i>i</i>-th parameter had an illegal value.</p> <p>If <i>info</i> > 0, then <i>i</i> eigenvectors (as indicated by the parameters <i>ifaill</i> and/or <i>ifailr</i> above) failed to converge. The corresponding columns of <i>vl</i> and/or <i>vr</i> contain no useful information.</p>

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `hsein` interface are the following:

<i>h</i>	Holds the matrix H of size (n,n) .
<i>wr</i>	Holds the vector of length n . Used in real flavors only.
<i>wi</i>	Holds the vector of length n . Used in real flavors only.
<i>w</i>	Holds the vector of length n . Used in complex flavors only.
<i>select</i>	Holds the vector of length n .
<i>vl</i>	Holds the matrix VL of size (n,mm) .
<i>vr</i>	Holds the matrix VR of size (n,mm) .
<i>ifail</i>	Holds the vector of length (mm) . Note that there will be an error condition if <i>ifail</i> is present and <i>vl</i> is omitted.
<i>ifailr</i>	Holds the vector of length (mm) . Note that there will be an error condition if <i>ifailr</i> is present and <i>vr</i> is omitted.
<i>initv</i>	Must be 'N' or 'U'. The default value is 'N'.
<i>eigsrc</i>	Must be 'N' or 'Q'. The default value is 'N'.
<i>side</i>	Restored based on the presence of arguments <i>vl</i> and <i>vr</i> as follows: $side = 'B'$, if both <i>vl</i> and <i>vr</i> are present, $side = 'L'$, if <i>vl</i> is present and <i>vr</i> omitted, $side = 'R'$, if <i>vl</i> is omitted and <i>vr</i> present, Note that there will be an error condition if both <i>vl</i> and <i>vr</i> are omitted.

Application Notes

Each computed right eigenvector x_i is the exact eigenvector of a nearby matrix $A + E_i$, such that $\|E_i\| < O(\epsilon) \|A\|$. Hence the residual is small:

$$\|Ax_i - \lambda_i x_i\| = O(\epsilon) \|A\|.$$

However, eigenvectors corresponding to close or coincident eigenvalues may not accurately span the relevant subspaces.

Similar remarks apply to computed left eigenvectors.

?trevc

Computes selected eigenvectors of an upper (quasi-) triangular matrix computed by ?hseqr.

Syntax

```
call strevc(side, howmny, select, n, t, ldt, vl, ldvl, vr, ldvr, mm, m, work, info)
call dtrevc(side, howmny, select, n, t, ldt, vl, ldvl, vr, ldvr, mm, m, work, info)
call ctrevc(side, howmny, select, n, t, ldt, vl, ldvl, vr, ldvr, mm, m, work, rwork, info)
call ztrevc(side, howmny, select, n, t, ldt, vl, ldvl, vr, ldvr, mm, m, work, rwork, info)
call trevc(t [, howmny] [, select] [, vl] [, vr] [, m] [, info])
```

Include Files

- `mk1.fi`, `lapack.f90`

Description

The routine computes some or all of the right and/or left eigenvectors of an upper triangular matrix T (or, for real flavors, an upper quasi-triangular matrix T). Matrices of this type are produced by the Schur factorization of a general matrix: $A = Q^* T^* Q^H$, as computed by [hseqqr](#).

The right eigenvector x and the left eigenvector y of T corresponding to an eigenvalue w , are defined by:

$$T^* x = w^* x, y^H T = w^* y^H, \text{ where } y^H \text{ denotes the conjugate transpose of } y.$$

The eigenvalues are not input to this routine, but are read directly from the diagonal blocks of T .

This routine returns the matrices X and/or Y of right and left eigenvectors of T , or the products $Q^* X$ and/or $Q^* Y$, where Q is an input matrix.

If Q is the orthogonal/unitary factor that reduces a matrix A to Schur form T , then $Q^* X$ and $Q^* Y$ are the matrices of right and left eigenvectors of A .

Input Parameters

<i>side</i>	<p>CHARACTER*1. Must be 'R' or 'L' or 'B'.</p> <p>If <i>side</i> = 'R', then only right eigenvectors are computed.</p> <p>If <i>side</i> = 'L', then only left eigenvectors are computed.</p> <p>If <i>side</i> = 'B', then all eigenvectors are computed.</p>
<i>howmny</i>	<p>CHARACTER*1. Must be 'A' or 'B' or 'S'.</p> <p>If <i>howmny</i> = 'A', then all eigenvectors (as specified by <i>side</i>) are computed.</p> <p>If <i>howmny</i> = 'B', then all eigenvectors (as specified by <i>side</i>) are computed and backtransformed by the matrices supplied in <i>vl</i> and <i>vr</i>.</p> <p>If <i>howmny</i> = 'S', then selected eigenvectors (as specified by <i>side</i> and <i>select</i>) are computed.</p>
<i>select</i>	<p>LOGICAL.</p> <p>Array, size at least $\max(1, n)$.</p> <p>If <i>howmny</i> = 'S', <i>select</i> specifies which eigenvectors are to be computed.</p> <p>If <i>howmny</i> = 'A' or 'B', <i>select</i> is not referenced.</p> <p>For real flavors:</p> <p>If <i>omega</i>(<i>j</i>) is a real eigenvalue, the corresponding real eigenvector is computed if <i>select</i>(<i>j</i>) is <code>.TRUE.</code>.</p> <p>If <i>omega</i>(<i>j</i>) and <i>omega</i>(<i>j</i> + 1) are the real and imaginary parts of a complex eigenvalue, the corresponding complex eigenvector is computed if either <i>select</i>(<i>j</i>) or <i>select</i>(<i>j</i> + 1) is <code>.TRUE.</code>, and on exit <i>select</i>(<i>j</i>) is set to <code>.TRUE.</code> and <i>select</i>(<i>j</i> + 1) is set to <code>.FALSE.</code></p> <p>For complex flavors:</p> <p>The eigenvector corresponding to the <i>j</i>-th eigenvalue is computed if <i>select</i>(<i>j</i>) is <code>.TRUE.</code>.</p>

n	INTEGER. The order of the matrix T ($n \geq 0$).
t, vl, vr	<p>REAL for <code>strevc</code></p> <p>DOUBLE PRECISION for <code>dtrevc</code></p> <p>COMPLEX for <code>ctrevc</code></p> <p>DOUBLE COMPLEX for <code>ztrevc</code>.</p> <p>Arrays:</p> <p>$t(ldt,*)$ contains the n-by-n matrix T in Schur canonical form. For complex flavors <code>ctrevc</code> and <code>ztrevc</code>, contains the upper triangular matrix T.</p> <p>The second dimension of t must be at least $\max(1, n)$.</p> <p>$vl(ldvl,*)$</p> <p>If <code>howmny</code> = 'B' and <code>side</code> = 'L' or 'B', then vl must contain an n-by-n matrix Q (usually the matrix of Schur vectors returned by <code>?hseqr</code>).</p> <p>If <code>howmny</code> = 'A' or 'S', then vl need not be set.</p> <p>The second dimension of vl must be at least $\max(1, mm)$ if <code>side</code> = 'L' or 'B' and at least 1 if <code>side</code> = 'R'.</p> <p>The array vl is not referenced if <code>side</code> = 'R'.</p> <p>$vr(ldvr,*)$</p> <p>If <code>howmny</code> = 'B' and <code>side</code> = 'R' or 'B', then vr must contain an n-by-n matrix Q (usually the matrix of Schur vectors returned by <code>?hseqr</code>). .</p> <p>If <code>howmny</code> = 'A' or 'S', then vr need not be set.</p> <p>The second dimension of vr must be at least $\max(1, mm)$ if <code>side</code> = 'R' or 'B' and at least 1 if <code>side</code> = 'L'.</p> <p>The array vr is not referenced if <code>side</code> = 'L'.</p> <p>$work(*)$ is a workspace array.</p> <p>size at least $\max(1, 3*n)$ for real flavors and at least $\max(1, 2*n)$ for complex flavors.</p>
ldt	INTEGER. The leading dimension of t ; at least $\max(1, n)$.
$ldvl$	<p>INTEGER. The leading dimension of vl.</p> <p>If <code>side</code> = 'L' or 'B', $ldvl \geq n$.</p> <p>If <code>side</code> = 'R', $ldvl \geq 1$.</p>
$ldvr$	<p>INTEGER. The leading dimension of vr.</p> <p>If <code>side</code> = 'R' or 'B', $ldvr \geq n$.</p> <p>If <code>side</code> = 'L', $ldvr \geq 1$.</p>
mm	<p>INTEGER. The number of columns in the arrays vl and/or vr. Must be at least m (the precise number of columns required).</p> <p>If <code>howmny</code> = 'A' or 'B', $mm = n$.</p> <p>If <code>howmny</code> = 'S': for real flavors, mm is obtained by counting 1 for each selected real eigenvector and 2 for each selected complex eigenvector;</p>

for complex flavors, *mm* is the number of selected eigenvectors (see *select*).

Constraint: $0 \leq mm \leq n$.

rwork

REAL for *ctrevc*

DOUBLE PRECISION for *ztrevc*.

Workspace array, size at least $\max(1, n)$.

Output Parameters

select

If a complex eigenvector of a real matrix was selected as specified above, then *select(j)* is set to `.TRUE.` and *select(j + 1)* to `.FALSE.`

t

COMPLEX for *ctrevc*

DOUBLE COMPLEX for *ztrevc*.

ctrevc/ztrevc modify the *t(ldt,*)* array, which is restored on exit.

vl, vr

If *side* = 'L' or 'B', *vl* contains the computed left eigenvectors (as specified by *howmny* and *select*).

If *side* = 'R' or 'B', *vr* contains the computed right eigenvectors (as specified by *howmny* and *select*).

The eigenvectors treated column-wise form a rectangular *n*-by-*mm* matrix.

For real flavors: a real eigenvector corresponding to a real eigenvalue occupies one column of the matrix; a complex eigenvector corresponding to a complex eigenvalue occupies two columns: the first column holds the real part of the eigenvector and the second column holds the imaginary part of the eigenvector. The matrix is stored in a one-dimensional array as described by *matrix_layout* (using either column major or row major layout).

m

INTEGER.

For complex flavors: the number of selected eigenvectors.

If *howmny* = 'A' or 'B', *m* is set to *n*.

For real flavors: the number of columns of *vl* and/or *vr* actually used to store the selected eigenvectors.

If *howmny* = 'A' or 'B', *m* is set to *n*.

info

INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine *trevc* interface are the following:

<i>t</i>	Holds the matrix <i>T</i> of size (n,n) .
<i>select</i>	Holds the vector of length n .
<i>vl</i>	Holds the matrix <i>VL</i> of size (n,mm) .
<i>vr</i>	Holds the matrix <i>VR</i> of size (n,mm) .
<i>side</i>	<p>If omitted, this argument is restored based on the presence of arguments <i>vl</i> and <i>vr</i> as follows:</p> <p><i>side</i> = 'B', if both <i>vl</i> and <i>vr</i> are present,</p> <p><i>side</i> = 'L', if <i>vr</i> is omitted,</p> <p><i>side</i> = 'R', if <i>vl</i> is omitted.</p> <p>Note that there will be an error condition if both <i>vl</i> and <i>vr</i> are omitted.</p>
<i>howmny</i>	<p>If omitted, this argument is restored based on the presence of argument <i>select</i> as follows:</p> <p><i>howmny</i> = 'V', if <i>q</i> is present,</p> <p><i>howmny</i> = 'N', if <i>q</i> is omitted.</p> <p>If present, <i>vect</i> = 'V' or 'U' and the argument <i>q</i> must also be present.</p> <p>Note that there will be an error condition if both <i>select</i> and <i>howmny</i> are present.</p>

Application Notes

If x_i is an exact right eigenvector and y_i is the corresponding computed eigenvector, then the angle $\theta(y_i, x_i)$ between them is bounded as follows: $\theta(y_i, x_i) \leq (c(n)\epsilon \|T\|_2) / \text{sep}_i$ where sep_i is the reciprocal condition number of x_i . The condition number sep_i may be computed by calling `?trsna`.

?trsna

Estimates condition numbers for specified eigenvalues and right eigenvectors of an upper (quasi-) triangular matrix.

Syntax

```
call strsna(job, howmny, select, n, t, ldt, vl, ldvl, vr, ldvr, s, sep, mm, m, work,
ldwork, iwork, info)

call dtrsna(job, howmny, select, n, t, ldt, vl, ldvl, vr, ldvr, s, sep, mm, m, work,
ldwork, iwork, info)

call ctrsna(job, howmny, select, n, t, ldt, vl, ldvl, vr, ldvr, s, sep, mm, m, work,
ldwork, rwork, info)

call ztrsna(job, howmny, select, n, t, ldt, vl, ldvl, vr, ldvr, s, sep, mm, m, work,
ldwork, rwork, info)

call trsna(t [, s] [, sep] [, vl] [, vr] [, select] [, m] [, info])
```

Include Files

- `mk1.fi`, `lapack.f90`

Description

to select condition numbers for the eigenpair corresponding to a complex conjugate pair of eigenvalues λ_j and λ_{j+1} , *select(j)* and/or *select(j + 1)* must be set `.TRUE.`

For complex flavors

To select condition numbers for the eigenpair corresponding to the eigenvalue λ_j , *select(j)* must be set `.TRUE.` *select* is not referenced if *howmny* = 'A'.

n

INTEGER. The order of the matrix *T* ($n \geq 0$).

t, *vl*, *vr*, *work*

REAL for *strsna*

DOUBLE PRECISION for *dtrsna*

COMPLEX for *ctrsna*

DOUBLE COMPLEX for *ztrsna*.

Arrays:

t(ldt,)* contains the *n*-by-*n* matrix *T*.

The second dimension of *t* must be at least $\max(1, n)$.

vl(ldvl,)*

If *job* = 'E' or 'B', then *vl* must contain the left eigenvectors of *T* (or of any matrix $Q^*T^*Q^H$ with *Q* unitary or orthogonal) corresponding to the eigenpairs specified by *howmny* and *select*. The eigenvectors must be stored in consecutive columns of *vl*, as returned by [trevc](#) or [hsein](#).

The second dimension of *vl* must be at least $\max(1, mm)$ if *job* = 'E' or 'B' and at least 1 if *job* = 'V'.

The array *vl* is not referenced if *job* = 'V'.

vr(ldvr,)*

If *job* = 'E' or 'B', then *vr* must contain the right eigenvectors of *T* (or of any matrix $Q^*T^*Q^H$ with *Q* unitary or orthogonal) corresponding to the eigenpairs specified by *howmny* and *select*. The eigenvectors must be stored in consecutive columns of *vr*, as returned by [trevc](#) or [hsein](#).

The second dimension of *vr* must be at least $\max(1, mm)$ if *job* = 'E' or 'B' and at least 1 if *job* = 'V'.

The array *vr* is not referenced if *job* = 'V'.

work is a workspace array, its dimension (*ldwork*, *n*+6).

The array *work* is not referenced if *job* = 'E'.

ldt

INTEGER. The leading dimension of *t*; at least $\max(1, n)$.

ldvl

INTEGER. The leading dimension of *vl*.

If *job* = 'E' or 'B', $ldvl \geq \max(1, n)$.

If *job* = 'V', $ldvl \geq 1$.

ldvr

INTEGER. The leading dimension of *vr*.

If *job* = 'E' or 'B', $ldvr \geq \max(1, n)$.

	<p>If $job = 'R'$, $ldvr \geq 1$.</p>
<i>mm</i>	<p>INTEGER. The number of elements in the arrays <i>s</i> and <i>sep</i>, and the number of columns in <i>vl</i> and <i>vr</i> (if used). Must be at least <i>m</i> (the precise number required).</p> <p>If $howmny = 'A'$, $mm = n$;</p> <p>if $howmny = 'S'$, for real flavors <i>mm</i> is obtained by counting 1 for each selected real eigenvalue and 2 for each selected complex conjugate pair of eigenvalues.</p> <p>for complex flavors <i>mm</i> is the number of selected eigenpairs (see <i>select</i>).</p> <p>Constraint:</p> <p>$0 \leq mm \leq n$.</p>
<i>ldwork</i>	<p>INTEGER. The leading dimension of <i>work</i>.</p> <p>If $job = 'V'$ or $'B'$, $ldwork \geq \max(1, n)$.</p> <p>If $job = 'E'$, $ldwork \geq 1$.</p>
<i>rwork</i>	<p>REAL for ctrsna, ztrsna.</p> <p>Array, size at least $\max(1, n)$. The array is not referenced if $job = 'E'$.</p>
<i>iwork</i>	<p>INTEGER for strsna, dtrsna.</p> <p>Array, size at least $\max(1, 2*(n - 1))$. The array is not referenced if $job = 'E'$.</p>

Output Parameters

<i>s</i>	<p>REAL for single-precision flavors</p> <p>DOUBLE PRECISION for double-precision flavors.</p> <p>Array, size at least $\max(1, mm)$ if $job = 'E'$ or $'B'$ and at least 1 if $job = 'V'$.</p> <p>Contains the reciprocal condition numbers of the selected eigenvalues if $job = 'E'$ or $'B'$, stored in consecutive elements of the array. Thus $s(j)$, $sep(j)$ and the <i>j</i>-th columns of <i>vl</i> and <i>vr</i> all correspond to the same eigenpair (but not in general the <i>j</i> th eigenpair unless all eigenpairs have been selected).</p> <p>For real flavors: for a complex conjugate pair of eigenvalues, two consecutive elements of <i>s</i> are set to the same value. The array <i>s</i> is not referenced if $job = 'V'$.</p>
<i>sep</i>	<p>REAL for single-precision flavors</p> <p>DOUBLE PRECISION for double-precision flavors.</p> <p>Array, size at least $\max(1, mm)$ if $job = 'V'$ or $'B'$ and at least 1 if $job = 'E'$. Contains the estimated reciprocal condition numbers of the selected right eigenvectors if $job = 'V'$ or $'B'$, stored in consecutive elements of the array.</p>

For real flavors: for a complex eigenvector, two consecutive elements of *sep* are set to the same value; if the eigenvalues cannot be reordered to compute *sep(j)*, then *sep(j)* is set to zero; this can only occur when the true value would be very small anyway. The array *sep* is not referenced if *job* = 'E'.

m INTEGER.

For complex flavors: the number of selected eigenpairs.

If *howmny* = 'A', *m* is set to *n*.

For real flavors: the number of elements of *s* and/or *sep* actually used to store the estimated condition numbers.

If *howmny* = 'A', *m* is set to *n*.

info INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `trsna` interface are the following:

<i>t</i>	Holds the matrix <i>T</i> of size (<i>n</i> , <i>n</i>).
<i>s</i>	Holds the vector of length (<i>mm</i>).
<i>sep</i>	Holds the vector of length (<i>mm</i>).
<i>vl</i>	Holds the matrix <i>VL</i> of size (<i>n</i> , <i>mm</i>).
<i>vr</i>	Holds the matrix <i>VR</i> of size (<i>n</i> , <i>mm</i>).
<i>select</i>	Holds the vector of length <i>n</i> .
<i>job</i>	Restored based on the presence of arguments <i>s</i> and <i>sep</i> as follows: <i>job</i> = 'B', if both <i>s</i> and <i>sep</i> are present, <i>job</i> = 'E', if <i>s</i> is present and <i>sep</i> omitted, <i>job</i> = 'V', if <i>s</i> is omitted and <i>sep</i> present. Note an error condition if both <i>s</i> and <i>sep</i> are omitted.
<i>howmny</i>	Restored based on the presence of the argument <i>select</i> as follows: <i>howmny</i> = 'S', if <i>select</i> is present, <i>howmny</i> = 'A', if <i>select</i> is omitted.

Note that the arguments *s*, *vl*, and *vr* must either be all present or all omitted.

Otherwise, an error condition is observed.

Application Notes

The computed values sep_i may overestimate the true value, but seldom by a factor of more than 3.

?trexc

Reorders the Schur factorization of a general matrix.

Syntax

```
call strexc(compq, n, t, ldt, q, ldq, ifst, ilst, work, info)
call dtrexc(compq, n, t, ldt, q, ldq, ifst, ilst, work, info)
call ctrexc(compq, n, t, ldt, q, ldq, ifst, ilst, info)
call ztrexc(compq, n, t, ldt, q, ldq, ifst, ilst, info)
call trexc(t, ifst, ilst [,q] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine reorders the Schur factorization of a general matrix $A = Q^*T^*Q^H$, so that the diagonal element or block of T with row index *ifst* is moved to row *ilst*.

The reordered Schur form S is computed by an unitary (or, for real flavors, orthogonal) similarity transformation: $S = Z^H * T * Z$. Optionally the updated matrix P of Schur vectors is computed as $P = Q * Z$, giving $A = P * S * P^H$.

Input Parameters

<i>compq</i>	CHARACTER*1. Must be 'V' or 'N'. If <i>compq</i> = 'V', then the Schur vectors (Q) are updated. If <i>compq</i> = 'N', then no Schur vectors are updated.
<i>n</i>	INTEGER. The order of the matrix T ($n \geq 0$).
<i>t, q</i>	REAL for strexc DOUBLE PRECISION for dtrexc COMPLEX for ctrexc DOUBLE COMPLEX for ztrexc. Arrays: <i>t(ldt,*)</i> contains the n -by- n matrix T . The second dimension of <i>t</i> must be at least $\max(1, n)$. <i>q(ldq,*)</i> If <i>compq</i> = 'V', then <i>q</i> must contain Q (Schur vectors). If <i>compq</i> = 'N', then <i>q</i> is not referenced. The second dimension of <i>q</i> must be at least $\max(1, n)$ if <i>compq</i> = 'V' and at least 1 if <i>compq</i> = 'N'.

<i>ldt</i>	INTEGER. The leading dimension of <i>t</i> ; at least $\max(1, n)$.
<i>ldq</i>	INTEGER. The leading dimension of <i>q</i> ; If <i>compq</i> = 'N', then $ldq \geq 1$. If <i>compq</i> = 'V', then $ldq \geq \max(1, n)$.
<i>ifst, ilst</i>	INTEGER. $1 \leq ifst \leq n$; $1 \leq ilst \leq n$. Must specify the reordering of the diagonal elements (or blocks, which is possible for real flavors) of the matrix <i>T</i> . The element (or block) with row index <i>ifst</i> is moved to row <i>ilst</i> by a sequence of exchanges between adjacent elements (or blocks).
<i>work</i>	REAL for <code>strex</code> DOUBLE PRECISION for <code>dtrex</code> . Array, size at least $\max(1, n)$.

Output Parameters

<i>t</i>	Overwritten by the updated matrix <i>S</i> .
<i>q</i>	If <i>compq</i> = 'V', <i>q</i> contains the updated matrix of Schur vectors.
<i>ifst, ilst</i>	Overwritten for real flavors only. If <i>ifst</i> pointed to the second row of a 2 by 2 block on entry, it is changed to point to the first row; <i>ilst</i> always points to the first row of the block in its final position (which may differ from its input value by ± 1).
<i>info</i>	INTEGER. If <i>info</i> = 0, the execution is successful. If <i>info</i> = - <i>i</i> , the <i>i</i> -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `trexc` interface are the following:

<i>t</i>	Holds the matrix <i>T</i> of size (n, n) .
<i>q</i>	Holds the matrix <i>Q</i> of size (n, n) .
<i>compq</i>	Restored based on the presence of the argument <i>q</i> as follows: <i>compq</i> = 'V', if <i>q</i> is present, <i>compq</i> = 'N', if <i>q</i> is omitted.

Application Notes

The computed matrix *S* is exactly similar to a matrix $T+E$, where $\|E\|_2 = O(\epsilon) * \|T\|_2$, and ϵ is the machine precision.

Optionally the routine also computes estimates of the reciprocal condition numbers of the average of the cluster of eigenvalues and of the invariant subspace.

Input Parameters

<i>job</i>	<p>CHARACTER*1. Must be 'N' or 'E' or 'V' or 'B'.</p> <p>If <i>job</i> = 'N', then no condition numbers are required.</p> <p>If <i>job</i> = 'E', then only the condition number for the cluster of eigenvalues is computed.</p> <p>If <i>job</i> = 'V', then only the condition number for the invariant subspace is computed.</p> <p>If <i>job</i> = 'B', then condition numbers for both the cluster and the invariant subspace are computed.</p>
<i>compq</i>	<p>CHARACTER*1. Must be 'V' or 'N'.</p> <p>If <i>compq</i> = 'V', then <i>Q</i> of the Schur vectors is updated.</p> <p>If <i>compq</i> = 'N', then no Schur vectors are updated.</p>
<i>select</i>	<p>LOGICAL.</p> <p>Array, size at least $\max(1, n)$.</p> <p>Specifies the eigenvalues in the selected cluster. To select an eigenvalue λ_j, <i>select(j)</i> must be <code>.TRUE.</code></p> <p><i>For real flavors:</i> to select a complex conjugate pair of eigenvalues λ_j and λ_{j+1} (corresponding 2 by 2 diagonal block), <i>select(j)</i> and/or <i>select(j + 1)</i> must be <code>.TRUE.</code>; the complex conjugate λ_j and λ_{j+1} must be either both included in the cluster or both excluded.</p>
<i>n</i>	<p>INTEGER. The order of the matrix <i>T</i> ($n \geq 0$).</p>
<i>t, q, work</i>	<p>REAL for strsen</p> <p>DOUBLE PRECISION for dtrsen</p> <p>COMPLEX for ctrsen</p> <p>DOUBLE COMPLEX for ztrsen.</p> <p>Arrays:</p> <p><i>t(ldt,*)</i> The upper quasi-triangular <i>n</i>-by-<i>n</i> matrix <i>T</i>, in Schur canonical form. The second dimension of <i>t</i> must be at least $\max(1, n)$.</p> <p><i>q(ldq,*)</i></p> <p>If <i>compq</i> = 'V', then <i>q</i> must contain the matrix <i>Q</i> of Schur vectors.</p> <p>If <i>compq</i> = 'N', then <i>q</i> is not referenced.</p> <p>The second dimension of <i>q</i> must be at least $\max(1, n)$ if <i>compq</i> = 'V' and at least 1 if <i>compq</i> = 'N'.</p> <p><i>work</i> is a workspace array, its dimension $\max(1, lwork)$.</p>
<i>ldt</i>	<p>INTEGER. The leading dimension of <i>t</i>; at least $\max(1, n)$.</p>
<i>ldq</i>	<p>INTEGER. The leading dimension of <i>q</i>;</p>

If `compq = 'N'`, then $ldq \geq 1$.

If `compq = 'V'`, then $ldq \geq \max(1, n)$.

lwork

INTEGER. The dimension of the array *work*.

If `job = 'V' or 'B'`, $lwork \geq \max(1, 2*m*(n-m))$.

If `job = 'E'`, then $lwork \geq \max(1, m*(n-m))$

If `job = 'N'`, then $lwork \geq 1$ for complex flavors and $lwork \geq \max(1, n)$ for real flavors.

If `lwork = -1`, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by [xerbla](#). See *Application Notes* for details.

iwork

INTEGER.*iwork*(*liwork*) is a workspace array. The array *iwork* is not referenced if `job = 'N' or 'E'`.

The actual amount of workspace required cannot exceed $n^2/2$ if `job = 'V' or 'B'`.

liwork

INTEGER.

The dimension of the array *iwork*.

If `job = 'V' or 'B'`, $liwork \geq \max(1, 2m(n-m))$.

If `job = 'E' or 'E'`, $liwork \geq 1$.

If `liwork = -1`, then a workspace query is assumed; the routine only calculates the optimal size of the *iwork* array, returns this value as the first entry of the *iwork* array, and no error message related to *liwork* is issued by [xerbla](#). See *Application Notes* for details.

Output Parameters

t

Overwritten by the reordered matrix *R* in Schur canonical form with the selected eigenvalues in the leading diagonal blocks.

q

If `compq = 'V'`, *q* contains the updated matrix of Schur vectors; the first *m* columns of the *Q* form an orthogonal basis for the specified invariant subspace.

w

COMPLEX for `ctrsen`

DOUBLE COMPLEX for `ztrsen`.

Array, size at least $\max(1, n)$. The recorded eigenvalues of *R*. The eigenvalues are stored in the same order as on the diagonal of *R*.

wr, wi

REAL for `strsen`

DOUBLE PRECISION for `dtrsen`

Arrays, size at least $\max(1, n)$. Contain the real and imaginary parts, respectively, of the reordered eigenvalues of *R*. The eigenvalues are stored in the same order as on the diagonal of *R*. Note that if a complex eigenvalue is sufficiently ill-conditioned, then its value may differ significantly from its value before reordering.

<i>m</i>	<p>INTEGER.</p> <p><i>For complex flavors:</i> the dimension of the specified invariant subspaces, which is the same as the number of selected eigenvalues (see <i>select</i>).</p> <p><i>For real flavors:</i> the dimension of the specified invariant subspace. The value of <i>m</i> is obtained by counting 1 for each selected real eigenvalue and 2 for each selected complex conjugate pair of eigenvalues (see <i>select</i>).</p> <p>Constraint: $0 \leq m \leq n$.</p>
<i>s</i>	<p>REAL for single-precision flavors</p> <p>DOUBLE PRECISION for double-precision flavors.</p> <p>If <i>job</i> = 'E' or 'B', <i>s</i> is a lower bound on the reciprocal condition number of the average of the selected cluster of eigenvalues.</p> <p>If <i>m</i> = 0 or <i>n</i>, then <i>s</i> = 1.</p> <p><i>For real flavors:</i> if <i>info</i> = 1, then <i>s</i> is set to zero. <i>s</i> is not referenced if <i>job</i> = 'N' or 'V'.</p>
<i>sep</i>	<p>REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors.</p> <p>If <i>job</i> = 'V' or 'B', <i>sep</i> is the estimated reciprocal condition number of the specified invariant subspace.</p> <p>If <i>m</i> = 0 or <i>n</i>, then <i>sep</i> = <i>T</i> .</p> <p><i>For real flavors:</i> if <i>info</i> = 1, then <i>sep</i> is set to zero.</p> <p><i>sep</i> is not referenced if <i>job</i> = 'N' or 'E'.</p>
<i>work</i> (1)	On exit, if <i>info</i> = 0, then <i>work</i> (1) returns the optimal size of <i>lwork</i> .
<i>iwork</i> (1)	On exit, if <i>info</i> = 0, then <i>iwork</i> (1) returns the optimal size of <i>liwork</i> .
<i>info</i>	<p>INTEGER.</p> <p>If <i>info</i> = 0, the execution is successful.</p> <p>If <i>info</i> = -<i>i</i>, the <i>i</i>-th parameter had an illegal value.</p> <p>If <i>info</i> = 1, the reordering of <i>T</i> failed because some eigenvalues are too close to separate (the problem is very ill-conditioned); <i>T</i> may have been partially reordered, and <i>wr</i> and <i>wi</i> contain the eigenvalues in the same order as in <i>T</i>; <i>s</i> and <i>sep</i> (if requested) are set to zero.</p>

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `trsen` interface are the following:

<i>t</i>	Holds the matrix <i>T</i> of size (<i>n</i> , <i>n</i>).
<i>select</i>	Holds the vector of length <i>n</i> .
<i>wr</i>	Holds the vector of length <i>n</i> . Used in real flavors only.

<i>wi</i>	Holds the vector of length <i>n</i> . Used in real flavors only.
<i>w</i>	Holds the vector of length <i>n</i> . Used in complex flavors only.
<i>q</i>	Holds the matrix <i>Q</i> of size (<i>n,n</i>).
<i>compq</i>	Restored based on the presence of the argument <i>q</i> as follows: <i>compq</i> = 'V', if <i>q</i> is present, <i>compq</i> = 'N', if <i>q</i> is omitted.
<i>job</i>	Restored based on the presence of arguments <i>s</i> and <i>sep</i> as follows: <i>job</i> = 'B', if both <i>s</i> and <i>sep</i> are present, <i>job</i> = 'E', if <i>s</i> is present and <i>sep</i> omitted, <i>job</i> = 'V', if <i>s</i> is omitted and <i>sep</i> present, <i>job</i> = 'N', if both <i>s</i> and <i>sep</i> are omitted.

Application Notes

The computed matrix *R* is exactly similar to a matrix *T+E*, where $\|E\|_2 = O(\varepsilon) * \|T\|_2$, and ε is the machine precision. The computed *s* cannot underestimate the true reciprocal condition number by more than a factor of $(\min(m, n-m))_{1/2}$; *sep* may differ from the true value by $(m*n-m^2)_{1/2}$. The angle between the computed invariant subspace and the true subspace is $O(\varepsilon) * \|A\|_2 / \text{sep}$. Note that if a 2-by-2 diagonal block is involved in the re-ordering, its off-diagonal elements are in general changed; the diagonal elements and the eigenvalues of the block are unchanged unless the block is sufficiently ill-conditioned, in which case they may be noticeably altered. It is possible for a 2-by-2 block to break into two 1-by-1 blocks, that is, for a pair of complex eigenvalues to become purely real.

If it is not clear how much workspace to supply, use a generous value of *lwork* (or *liwork*) for the first run or set *lwork* = -1 (*liwork* = -1).

If *lwork* (or *liwork*) has any of admissible sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*) on exit. Use this value (*work*(1), *iwork*(1)) for subsequent runs.

If *lwork* = -1 (*liwork* = -1), the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*). This operation is called a workspace query.

Note that if *lwork* (*liwork*) is less than the minimal required value and is not equal to -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?trsyl

Solves Sylvester equation for real quasi-triangular or complex triangular matrices.

Syntax

```
call strsyl(trana, tranb, isgn, m, n, a, lda, b, ldb, c, ldc, scale, info)
call dtrsyl(trana, tranb, isgn, m, n, a, lda, b, ldb, c, ldc, scale, info)
call ctrsyl(trana, tranb, isgn, m, n, a, lda, b, ldb, c, ldc, scale, info)
call ztrsyl(trana, tranb, isgn, m, n, a, lda, b, ldb, c, ldc, scale, info)
call trsyl(a, b, c, scale [, trana] [,tranb] [,isgn] [,info])
```

Include Files

- `mk1.fi`, `lapack.f90`

Description

The routine solves the Sylvester matrix equation $\text{op}(A) * X \pm X * \text{op}(B) = \alpha * C$, where $\text{op}(A) = A$ or A^H , and the matrices A and B are upper triangular (or, for real flavors, upper quasi-triangular in canonical Schur form); $\alpha \leq 1$ is a scale factor determined by the routine to avoid overflow in X ; A is m -by- m , B is n -by- n , and C and X are both m -by- n . The matrix X is obtained by a straightforward process of back substitution.

The equation has a unique solution if and only if $\alpha_i \pm \beta_i \neq 0$, where $\{\alpha_i\}$ and $\{\beta_i\}$ are the eigenvalues of A and B , respectively, and the sign (+ or -) is the same as that used in the equation to be solved.

Input Parameters

<i>trana</i>	<p>CHARACTER*1. Must be 'N' or 'T' or 'C'.</p> <p>If <i>trana</i> = 'N', then $\text{op}(A) = A$.</p> <p>If <i>trana</i> = 'T', then $\text{op}(A) = A^T$ (real flavors only).</p> <p>If <i>trana</i> = 'C' then $\text{op}(A) = A^H$.</p>
<i>tranb</i>	<p>CHARACTER*1. Must be 'N' or 'T' or 'C'.</p> <p>If <i>tranb</i> = 'N', then $\text{op}(B) = B$.</p> <p>If <i>tranb</i> = 'T', then $\text{op}(B) = B^T$ (real flavors only).</p> <p>If <i>tranb</i> = 'C', then $\text{op}(B) = B^H$.</p>
<i>isgn</i>	<p>INTEGER. Indicates the form of the Sylvester equation.</p> <p>If <i>isgn</i> = +1, $\text{op}(A) * X + X * \text{op}(B) = \alpha * C$.</p> <p>If <i>isgn</i> = -1, $\text{op}(A) * X - X * \text{op}(B) = \alpha * C$.</p>
<i>m</i>	INTEGER. The order of A , and the number of rows in X and C ($m \geq 0$).
<i>n</i>	INTEGER. The order of B , and the number of columns in X and C ($n \geq 0$).
<i>a</i> , <i>b</i> , <i>c</i>	<p>REAL for <code>strsyl</code></p> <p>DOUBLE PRECISION for <code>dtrsyl</code></p> <p>COMPLEX for <code>ctrsyl</code></p> <p>DOUBLE COMPLEX for <code>ztrsyl</code>.</p> <p>Arrays:</p> <p><i>a</i>(<i>lda</i>,*) contains the matrix A.</p> <p>The second dimension of <i>a</i> must be at least $\max(1, m)$.</p> <p><i>b</i>(<i>ldb</i>,*) contains the matrix B.</p> <p>The second dimension of <i>b</i> must be at least $\max(1, n)$.</p> <p><i>c</i>(<i>ldc</i>,*) contains the matrix C.</p> <p>The second dimension of <i>c</i> must be at least $\max(1, n)$.</p>
<i>lda</i>	INTEGER. The leading dimension of <i>a</i> ; at least $\max(1, m)$.

<i>ldb</i>	INTEGER. The leading dimension of <i>b</i> ; at least $\max(1, n)$.
<i>ldc</i>	INTEGER. The leading dimension of <i>c</i> ; at least $\max(1, m)$.

Output Parameters

<i>c</i>	Overwritten by the solution matrix <i>X</i> .
<i>scale</i>	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors. The value of the scale factor α .
<i>info</i>	INTEGER. If <i>info</i> = 0, the execution is successful. If <i>info</i> = - <i>i</i> , the <i>i</i> -th parameter had an illegal value. If <i>info</i> = 1, <i>A</i> and <i>B</i> have common or close eigenvalues; perturbed values were used to solve the equation.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `trsyl` interface are the following:

<i>a</i>	Holds the matrix <i>A</i> of size (m, m) .
<i>b</i>	Holds the matrix <i>B</i> of size (n, n) .
<i>c</i>	Holds the matrix <i>C</i> of size (m, n) .
<i>trana</i>	Must be 'N', 'C', or 'T'. The default value is 'N'.
<i>tranb</i>	Must be 'N', 'C', or 'T'. The default value is 'N'.
<i>isgn</i>	Must be +1 or -1. The default value is +1.

Application Notes

Let *X* be the exact, *Y* the corresponding computed solution, and *R* the residual matrix: $R = C - (AY \pm YB)$. Then the residual is always small:

$$\|R\|_F = O(\epsilon) * (\|A\|_F + \|B\|_F) * \|Y\|_F.$$

However, *Y* is not necessarily the exact solution of a slightly perturbed equation; in other words, the solution is not backwards stable.

For the forward error, the following bound holds:

$$\|Y - X\|_F \leq \|R\|_F / \text{sep}(A, B)$$

but this may be a considerable overestimate. See [Golub96] for a definition of $\text{sep}(A, B)$.

The approximate number of floating-point operations for real flavors is $m * n * (m + n)$. For complex flavors it is 4 times greater.

Generalized Nonsymmetric Eigenvalue Problems

This section describes LAPACK routines for solving generalized nonsymmetric eigenvalue problems, reordering the generalized Schur factorization of a pair of matrices, as well as performing a number of related computational tasks.

A *generalized nonsymmetric eigenvalue problem* is as follows: given a pair of nonsymmetric (or non-Hermitian) n -by- n matrices A and B , find the *generalized eigenvalues* λ and the corresponding *generalized eigenvectors* x and y that satisfy the equations

$$Ax = \lambda Bx \text{ (right generalized eigenvectors } x\text{)}$$

and

$$y^H A = \lambda y^H B \text{ (left generalized eigenvectors } y\text{)}.$$

Table "Computational Routines for Solving Generalized Nonsymmetric Eigenvalue Problems" lists LAPACK routines (FORTRAN 77 interface) used to solve the generalized nonsymmetric eigenvalue problems and the generalized Sylvester equation. The corresponding routine names in the Fortran 95 interface are without the first symbol.

Computational Routines for Solving Generalized Nonsymmetric Eigenvalue Problems

Routine name	Operation performed
gghrd	Reduces a pair of matrices to generalized upper Hessenberg form using orthogonal/unitary transformations.
ggbal	Balances a pair of general real or complex matrices.
ggbak	Forms the right or left eigenvectors of a generalized eigenvalue problem.
hgeqz	Implements the QZ method for finding the generalized eigenvalues of the matrix pair (H,T).
tgevc	Computes some or all of the right and/or left generalized eigenvectors of a pair of upper triangular matrices
tgexc	Reorders the generalized Schur decomposition of a pair of matrices (A,B) so that one diagonal block of (A,B) moves to another row index.
tgseq	Reorders the <i>generalized</i> Schur decomposition of a pair of matrices (A,B) so that a selected cluster of eigenvalues appears in the leading diagonal blocks of (A,B).
tgsl	Solves the generalized Sylvester equation.
tgsl	Estimates reciprocal condition numbers for specified eigenvalues and/or eigenvectors of a pair of matrices in generalized real Schur canonical form.

?gghrd

Reduces a pair of matrices to generalized upper Hessenberg form using orthogonal/unitary transformations.

Syntax

```
call sgghrd(compq, compz, n, ilo, ihi, a, lda, b, ldb, q, ldq, z, ldz, info)
call dgghrd(compq, compz, n, ilo, ihi, a, lda, b, ldb, q, ldq, z, ldz, info)
call cgghrd(compq, compz, n, ilo, ihi, a, lda, b, ldb, q, ldq, z, ldz, info)
call zgghrd(compq, compz, n, ilo, ihi, a, lda, b, ldb, q, ldq, z, ldz, info)
call gghrd(a, b [,ilo] [,ihi] [,q] [,z] [,compq] [,compz] [,info])
```

Include Files

- `mkl.fi`, `lapack.f90`

Description

The routine reduces a pair of real/complex matrices (A, B) to generalized upper Hessenberg form using orthogonal/unitary transformations, where A is a general matrix and B is upper triangular. The form of the generalized eigenvalue problem is $A^*x = \lambda^*B^*x$, and B is typically made upper triangular by computing its QR factorization and moving the orthogonal matrix Q to the left side of the equation.

This routine simultaneously reduces A to a Hessenberg matrix H :

$$Q^H A Z = H$$

and transforms B to another upper triangular matrix T :

$$Q^H B Z = T$$

in order to reduce the problem to its standard form $H^*y = \lambda^*T^*y$, where $y = Z^H x$.

The orthogonal/unitary matrices Q and Z are determined as products of Givens rotations. They may either be formed explicitly, or they may be postmultiplied into input matrices Q_1 and Z_1 , so that

$$Q_1^* A Z_1^H = (Q_1^* Q)^* H^* (Z_1^* Z)^H$$

$$Q_1^* B Z_1^H = (Q_1^* Q)^* T^* (Z_1^* Z)^H$$

If Q_1 is the orthogonal/unitary matrix from the QR factorization of B in the original equation $A^*x = \lambda^*B^*x$, then the routine `?gghrd` reduces the original problem to generalized Hessenberg form.

Input Parameters

<i>compq</i>	<p>CHARACTER*1. Must be 'N', 'I', or 'V'.</p> <p>If <i>compq</i> = 'N', matrix Q is not computed.</p> <p>If <i>compq</i> = 'I', Q is initialized to the unit matrix, and the orthogonal/unitary matrix Q is returned;</p> <p>If <i>compq</i> = 'V', Q must contain an orthogonal/unitary matrix Q_1 on entry, and the product Q_1^*Q is returned.</p>
<i>compz</i>	<p>CHARACTER*1. Must be 'N', 'I', or 'V'.</p> <p>If <i>compz</i> = 'N', matrix Z is not computed.</p> <p>If <i>compz</i> = 'I', Z is initialized to the unit matrix, and the orthogonal/unitary matrix Z is returned;</p> <p>If <i>compz</i> = 'V', Z must contain an orthogonal/unitary matrix Z_1 on entry, and the product Z_1^*Z is returned.</p>
<i>n</i>	<p>INTEGER. The order of the matrices A and B ($n \geq 0$).</p>
<i>ilo, ihi</i>	<p>INTEGER. <i>ilo</i> and <i>ihi</i> mark the rows and columns of A which are to be reduced. It is assumed that A is already upper triangular in rows and columns $1:ilo-1$ and $ihi+1:n$. Values of <i>ilo</i> and <i>ihi</i> are normally set by a previous call to ggbal; otherwise they should be set to 1 and n respectively.</p> <p>Constraint:</p> <p>If $n > 0$, then $1 \leq ilo \leq ihi \leq n$;</p> <p>if $n = 0$, then $ilo = 1$ and $ihi = 0$.</p>

a, b, q, z	<p>REAL for sgghrd</p> <p>DOUBLE PRECISION for dgghrd</p> <p>COMPLEX for cgghrd</p> <p>DOUBLE COMPLEX for zgghrd.</p> <p>Arrays:</p> <p>$a(lda,*)$ contains the n-by-n general matrix A.</p> <p>The second dimension of a must be at least $\max(1, n)$.</p> <p>$b ldb,*)$ contains the n-by-n upper triangular matrix B.</p> <p>The second dimension of b must be at least $\max(1, n)$.</p> <p>$q(ldq,*)$</p> <p>If $compq = 'N'$, then q is not referenced.</p> <p>If $compq = 'V'$, then q must contain the orthogonal/unitary matrix Q_1, typically from the QR factorization of B.</p> <p>The second dimension of q must be at least $\max(1, n)$.</p> <p>$z(ldz,*)$</p> <p>If $compz = 'N'$, then z is not referenced.</p> <p>If $compz = 'V'$, then z must contain the orthogonal/unitary matrix Z_1.</p> <p>The second dimension of z must be at least $\max(1, n)$.</p>
lda	INTEGER. The leading dimension of a ; at least $\max(1, n)$.
ldb	INTEGER. The leading dimension of b ; at least $\max(1, n)$.
ldq	<p>INTEGER. The leading dimension of q;</p> <p>If $compq = 'N'$, then $ldq \geq 1$.</p> <p>If $compq = 'I'$ or $'V'$, then $ldq \geq \max(1, n)$.</p>
ldz	<p>INTEGER. The leading dimension of z;</p> <p>If $compz = 'N'$, then $ldz \geq 1$.</p> <p>If $compz = 'I'$ or $'V'$, then $ldz \geq \max(1, n)$.</p>

Output Parameters

a	On exit, the upper triangle and the first subdiagonal of A are overwritten with the upper Hessenberg matrix H , and the rest is set to zero.
b	On exit, overwritten by the upper triangular matrix $T = Q^H * B * Z$. The elements below the diagonal are set to zero.
q	<p>If $compq = 'I'$, then q contains the orthogonal/unitary matrix Q, ;</p> <p>If $compq = 'V'$, then q is overwritten by the product $Q_1 * Q$.</p>
z	<p>If $compz = 'I'$, then z contains the orthogonal/unitary matrix Z;</p> <p>If $compz = 'V'$, then z is overwritten by the product $Z_1 * Z$.</p>

info INTEGER.
 If *info* = 0, the execution is successful.
 If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `gghrd` interface are the following:

<i>a</i>	Holds the matrix <i>A</i> of size (n,n) .
<i>b</i>	Holds the matrix <i>B</i> of size (n,n) .
<i>q</i>	Holds the matrix <i>Q</i> of size (n,n) .
<i>z</i>	Holds the matrix <i>Z</i> of size (n,n) .
<i>ilo</i>	Default value for this argument is <i>ilo</i> = 1.
<i>ihi</i>	Default value for this argument is <i>ihi</i> = <i>n</i> .
<i>compq</i>	<p>If omitted, this argument is restored based on the presence of argument <i>q</i> as follows: <i>compq</i> = 'I', if <i>q</i> is present, <i>compq</i> = 'N', if <i>q</i> is omitted.</p> <p>If present, <i>compq</i> must be equal to 'I' or 'V' and the argument <i>q</i> must also be present. Note that there will be an error condition if <i>compq</i> is present and <i>q</i> omitted.</p>
<i>compz</i>	<p>If omitted, this argument is restored based on the presence of argument <i>z</i> as follows: <i>compz</i> = 'I', if <i>z</i> is present, <i>compz</i> = 'N', if <i>z</i> is omitted.</p> <p>If present, <i>compz</i> must be equal to 'I' or 'V' and the argument <i>z</i> must also be present. Note that there will be an error condition if <i>compz</i> is present and <i>z</i> omitted.</p>

?ggbal

Balances a pair of general real or complex matrices.

Syntax

```
call sggbal(job, n, a, lda, b, ldb, ilo, ihi, lscale, rscale, work, info)
call dggbal(job, n, a, lda, b, ldb, ilo, ihi, lscale, rscale, work, info)
call cggbal(job, n, a, lda, b, ldb, ilo, ihi, lscale, rscale, work, info)
call zggbal(job, n, a, lda, b, ldb, ilo, ihi, lscale, rscale, work, info)
call ggbal(a, b [,ilo] [,ihi] [,lscale] [,rscale] [,job] [,info])
```

Include Files

- `mkl.fi`, `lapack.f90`

Description

The routine balances a pair of general real/complex matrices (A, B). This involves, first, permuting A and B by similarity transformations to isolate eigenvalues in the first 1 to $ilo-1$ and last $ihi+1$ to n elements on the diagonal; and second, applying a diagonal similarity transformation to rows and columns ilo to ihi to make the rows and columns as close in norm as possible. Both steps are optional. Balancing may reduce the 1-norm of the matrices, and improve the accuracy of the computed eigenvalues and/or eigenvectors in the generalized eigenvalue problem $A^*x = \lambda^*B^*x$.

Input Parameters

<i>job</i>	<p>CHARACTER*1. Specifies the operations to be performed on A and B. Must be 'N' or 'P' or 'S' or 'B'.</p> <p>If <i>job</i> = 'N', then no operations are done; simply set $ilo = 1$, $ihi = n$, $lscale(i) = 1.0$ and $rscale(i) = 1.0$ for $i = 1, \dots, n$.</p> <p>If <i>job</i> = 'P', then permute only.</p> <p>If <i>job</i> = 'S', then scale only.</p> <p>If <i>job</i> = 'B', then both permute and scale.</p>
<i>n</i>	INTEGER. The order of the matrices A and B ($n \geq 0$).
<i>a, b</i>	<p>REAL for sggbal</p> <p>DOUBLE PRECISION for dggbal</p> <p>COMPLEX for cggbal</p> <p>DOUBLE COMPLEX for zggbal.</p> <p>Arrays:</p> <p>$a(lda,*)$ contains the matrix A. The second dimension of a must be at least $\max(1, n)$.</p> <p>$b(l db,*)$ contains the matrix B. The second dimension of b must be at least $\max(1, n)$.</p> <p>If <i>job</i> = 'N', a and b are not referenced.</p>
<i>lda</i>	INTEGER. The leading dimension of a ; at least $\max(1, n)$.
<i>ldb</i>	INTEGER. The leading dimension of b ; at least $\max(1, n)$.
<i>work</i>	<p>REAL for single precision flavors</p> <p>DOUBLE PRECISION for double precision flavors.</p> <p>Workspace array, size at least $\max(1, 6n)$ when <i>job</i> = 'S' or 'B', or at least 1 when <i>job</i> = 'N' or 'P'.</p>

Output Parameters

<i>a, b</i>	Overwritten by the balanced matrices A and B , respectively.
<i>ilo, ihi</i>	<p>INTEGER. <i>ilo</i> and <i>ihi</i> are set to integers such that on exit $A_{i,j} = 0$ and $B_{i,j} = 0$ if $i > j$ and $j = 1, \dots, ilo-1$ or $i = ihi+1, \dots, n$.</p> <p>If <i>job</i> = 'N' or 'S', then $ilo = 1$ and $ihi = n$.</p>

lscale, *rscale* REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Arrays, size at least $\max(1, n)$.
lscale contains details of the permutations and scaling factors applied to the left side of *A* and *B*.
If P_j is the index of the row interchanged with row j , and D_j is the scaling factor applied to row j , then
 $lscale(j) = P_j$, for $j = 1, \dots, ilo-1$
 $= D_j$, for $j = ilo, \dots, ihi$
 $= P_j$, for $j = ihi+1, \dots, n$.
rscale contains details of the permutations and scaling factors applied to the right side of *A* and *B*.
If P_j is the index of the column interchanged with column j , and D_j is the scaling factor applied to column j , then
 $rscale(j) = P_j$, for $j = 1, \dots, ilo-1$
 $= D_j$, for $j = ilo, \dots, ihi$
 $= P_j$, for $j = ihi+1, \dots, n$.
The order in which the interchanges are made is n to $ihl+1$, then 1 to $ilo-1$.

info INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `ggbal` interface are the following:

<i>a</i>	Holds the matrix <i>A</i> of size (n,n) .
<i>b</i>	Holds the matrix <i>B</i> of size (n,n) .
<i>lscale</i>	Holds the vector of length (n) .
<i>rscale</i>	Holds the vector of length (n) .
<i>ilo</i>	Default value for this argument is $ilo = 1$.
<i>ihl</i>	Default value for this argument is $ihl = n$.
<i>job</i>	Must be 'B', 'S', 'P', or 'N'. The default value is 'B'.

?ggbak

Forms the right or left eigenvectors of a generalized eigenvalue problem.

Syntax

```
call sggbak(job, side, n, ilo, ihi, lscale, rscale, m, v, ldv, info)
call dggbak(job, side, n, ilo, ihi, lscale, rscale, m, v, ldv, info)
call cggbak(job, side, n, ilo, ihi, lscale, rscale, m, v, ldv, info)
call zggbak(job, side, n, ilo, ihi, lscale, rscale, m, v, ldv, info)
call gggbak(v [, ilo] [, ihi] [, lscale] [, rscale] [, job] [, info])
```

Include Files

Description

The routine forms the right or left eigenvectors of a real/complex generalized eigenvalue problem

$$A*x = \lambda*B*x$$

by backward transformation on the computed eigenvectors of the balanced pair of matrices output by [ggbal](#).

Input Parameters

<i>job</i>	<p>CHARACTER*1. Specifies the type of backward transformation required. Must be 'N', 'P', 'S', or 'B'.</p> <p>If <i>job</i> = 'N', then no operations are done; return.</p> <p>If <i>job</i> = 'P', then do backward transformation for permutation only.</p> <p>If <i>job</i> = 'S', then do backward transformation for scaling only.</p> <p>If <i>job</i> = 'B', then do backward transformation for both permutation and scaling. This argument must be the same as the argument <i>job</i> supplied to ?ggbal.</p>
<i>side</i>	<p>CHARACTER*1. Must be 'L' or 'R'.</p> <p>If <i>side</i> = 'L', then <i>v</i> contains left eigenvectors.</p> <p>If <i>side</i> = 'R', then <i>v</i> contains right eigenvectors.</p>
<i>n</i>	<p>INTEGER. The number of rows of the matrix <i>V</i> ($n \geq 0$).</p>
<i>ilo, ihi</i>	<p>INTEGER. The integers <i>ilo</i> and <i>ihi</i> determined by ?ggbal. Constraint:</p> <p>If $n > 0$, then $1 \leq ilo \leq ihi \leq n$;</p> <p>if $n = 0$, then $ilo = 1$ and $ihi = 0$.</p>
<i>lscale, rscale</i>	<p>REAL for single precision flavors</p> <p>DOUBLE PRECISION for double precision flavors.</p> <p>Arrays, size at least $\max(1, n)$.</p> <p>The array <i>lscale</i> contains details of the permutations and/or scaling factors applied to the left side of <i>A</i> and <i>B</i>, as returned by ?ggbal.</p> <p>The array <i>rscale</i> contains details of the permutations and/or scaling factors applied to the right side of <i>A</i> and <i>B</i>, as returned by ?ggbal.</p>
<i>m</i>	<p>INTEGER. The number of columns of the matrix <i>V</i></p>

($m \geq 0$).

v REAL for sggbak
DOUBLE PRECISION for dggbak
COMPLEX for cggbak
DOUBLE COMPLEX for zggbak.
Array *v*(*ldv*,*) . Contains the matrix of right or left eigenvectors to be transformed, as returned by [tgevc](#).
The second dimension of *v* must be at least $\max(1, m)$.

ldv INTEGER. The leading dimension of *v*; at least $\max(1, n)$.

Output Parameters

v Overwritten by the transformed eigenvectors

info INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine *ggbak* interface are the following:

v Holds the matrix *V* of size (*n*,*m*).

lscale Holds the vector of length *n*.

rscale Holds the vector of length *n*.

ilo Default value for this argument is *ilo* = 1.

ihi Default value for this argument is *ihi* = *n*.

job Must be 'B', 'S', 'P', or 'N'. The default value is 'B'.

side If omitted, this argument is restored based on the presence of arguments *lscale* and *rscale* as follows:
side = 'L', if *lscale* is present and *rscale* omitted,
side = 'R', if *lscale* is omitted and *rscale* present.
Note that there will be an error condition if both *lscale* and *rscale* are present or if they both are omitted.

?hgeqz

Implements the QZ method for finding the generalized eigenvalues of the matrix pair (H,T).

Syntax

```
call shgeqz(job, compq, compz, n, ilo, ihi, h, ldh, t, ldt, alphas, alphas, beta, q,
ldq, z, ldz, work, lwork, info)

call dhgeqz(job, compq, compz, n, ilo, ihi, h, ldh, t, ldt, alphas, alphas, beta, q,
ldq, z, ldz, work, lwork, info)

call chgeqz(job, compq, compz, n, ilo, ihi, h, ldh, t, ldt, alpha, beta, q, ldq, z,
ldz, work, lwork, rwork, info)

call zhgeqz(job, compq, compz, n, ilo, ihi, h, ldh, t, ldt, alpha, beta, q, ldq, z,
ldz, work, lwork, rwork, info)

call hgeqz(h, t [,ilo] [,ihi] [,alphas] [,alphas] [,beta] [,q] [,z] [,job] [,compq]
[,compz] [,info])

call hgeqz(h, t [,ilo] [,ihi] [,alpha] [,beta] [,q] [,z] [,job] [,compq] [, compz]
[,info])
```

Description

The routine computes the eigenvalues of a real/complex matrix pair (H, T) , where H is an upper Hessenberg matrix and T is upper triangular, using the double-shift version (for real flavors) or single-shift version (for complex flavors) of the QZ method. Matrix pairs of this type are produced by the reduction to generalized upper Hessenberg form of a real/complex matrix pair (A, B) :

$$A = Q_1^* H^* Z_1^H, B = Q_1^* T^* Z_1^H,$$

as computed by ?gghrd.

For real flavors:

If $job = 'S'$, then the Hessenberg-triangular pair (H, T) is reduced to generalized Schur form,

$$H = Q^* S^* Z^T, T = Q^* P^* Z^T,$$

where Q and Z are orthogonal matrices, P is an upper triangular matrix, and S is a quasi-triangular matrix with 1-by-1 and 2-by-2 diagonal blocks. The 1-by-1 blocks correspond to real eigenvalues of the matrix pair (H, T) and the 2-by-2 blocks correspond to complex conjugate pairs of eigenvalues.

Additionally, the 2-by-2 upper triangular diagonal blocks of P corresponding to 2-by-2 blocks of S are reduced to positive diagonal form, that is, if $S_{j+1,j}$ is non-zero, then $P_{j+1,j} = P_{j,j+1} = 0$, $P_{j,j} > 0$, and $P_{j+1,j+1} > 0$.

For complex flavors:

If $job = 'S'$, then the Hessenberg-triangular pair (H, T) is reduced to generalized Schur form,

$$H = Q^* S^* Z^H, T = Q^* P^* Z^H,$$

where Q and Z are unitary matrices, and S and P are upper triangular.

For all function flavors:

Optionally, the orthogonal/unitary matrix Q from the generalized Schur factorization may be post-multiplied by an input matrix Q_1 , and the orthogonal/unitary matrix Z may be post-multiplied by an input matrix Z_1 .

If Q_1 and Z_1 are the orthogonal/unitary matrices from ?gghrd that reduced the matrix pair (A, B) to generalized upper Hessenberg form, then the output matrices $Q_1 Q$ and $Z_1 Z$ are the orthogonal/unitary factors from the generalized Schur factorization of (A, B) :

$$A = (Q_1 Q)^* S^* (Z_1 Z)^H, B = (Q_1 Q)^* P^* (Z_1 Z)^H.$$

To avoid overflow, eigenvalues of the matrix pair (H,T) (equivalently, of (A,B)) are computed as a pair of values (α, β) . For `chgeqz/zhgeqz`, α and β are complex, and for `shgeqz/dhgeqz`, α is complex and β real. If β is nonzero, $\lambda = \alpha/\beta$ is an eigenvalue of the generalized nonsymmetric eigenvalue problem (GNEP)

$$A^*x = \lambda^*B^*x$$

and if α is nonzero, $\mu = \beta/\alpha$ is an eigenvalue of the alternate form of the GNEP

$$\mu^*A^*y = B^*y.$$

Real eigenvalues (for real flavors) or the values of α and β for the i -th eigenvalue (for complex flavors) can be read directly from the generalized Schur form:

$$\alpha = S_{i,i}, \beta = P_{i,i}.$$

Input Parameters

<i>job</i>	<p>CHARACTER*1. Specifies the operations to be performed. Must be 'E' or 'S'.</p> <p>If <i>job</i> = 'E', then compute eigenvalues only;</p> <p>If <i>job</i> = 'S', then compute eigenvalues and the Schur form.</p>
<i>compq</i>	<p>CHARACTER*1. Must be 'N', 'I', or 'V'.</p> <p>If <i>compq</i> = 'N', left Schur vectors (q) are not computed;</p> <p>If <i>compq</i> = 'I', q is initialized to the unit matrix and the matrix of left Schur vectors of (H,T) is returned;</p> <p>If <i>compq</i> = 'V', q must contain an orthogonal/unitary matrix Q_1 on entry and the product Q_1^*Q is returned.</p>
<i>compz</i>	<p>CHARACTER*1. Must be 'N', 'I', or 'V'.</p> <p>If <i>compz</i> = 'N', right Schur vectors (z) are not computed;</p> <p>If <i>compz</i> = 'I', z is initialized to the unit matrix and the matrix of right Schur vectors of (H,T) is returned;</p> <p>If <i>compz</i> = 'V', z must contain an orthogonal/unitary matrix Z_1 on entry and the product Z_1^*Z is returned.</p>
<i>n</i>	<p>INTEGER. The order of the matrices H, T, Q, and Z</p> <p>($n \geq 0$).</p>
<i>ilo, ihi</i>	<p>INTEGER. <i>ilo</i> and <i>ihi</i> mark the rows and columns of H which are in Hessenberg form. It is assumed that H is already upper triangular in rows and columns $1:ilo-1$ and $ihi+1:n$.</p> <p>Constraint:</p> <p>If $n > 0$, then $1 \leq ilo \leq ihi \leq n$;</p> <p>if $n = 0$, then $ilo = 1$ and $ihi = 0$.</p>
<i>h, t, q, z, work</i>	<p>REAL for <code>shgeqz</code></p> <p>DOUBLE PRECISION for <code>dhgeqz</code></p> <p>COMPLEX for <code>chgeqz</code></p> <p>DOUBLE COMPLEX for <code>zhgeqz</code>.</p>

Arrays:

On entry, $h(ldh,*)$ contains the n -by- n upper Hessenberg matrix H .

The second dimension of h must be at least $\max(1, n)$.

On entry, $t(ldt,*)$ contains the n -by- n upper triangular matrix T .

The second dimension of t must be at least $\max(1, n)$.

$q(ldq,*)$:

On entry, if $compq = 'V'$, this array contains the orthogonal/unitary matrix Q_1 used in the reduction of (A,B) to generalized Hessenberg form.

If $compq = 'N'$, then q is not referenced.

The second dimension of q must be at least $\max(1, n)$.

$z(ldz,*)$:

On entry, if $compz = 'V'$, this array contains the orthogonal/unitary matrix Z_1 used in the reduction of (A,B) to generalized Hessenberg form.

If $compz = 'N'$, then z is not referenced.

The second dimension of z must be at least $\max(1, n)$.

$work$ is a workspace array, its dimension $\max(1, lwork)$.

ldh INTEGER. The leading dimension of h ; at least $\max(1, n)$.

ldt INTEGER. The leading dimension of t ; at least $\max(1, n)$.

ldq INTEGER. The leading dimension of q ;

If $compq = 'N'$, then $ldq \geq 1$.

If $compq = 'I'$ or $'V'$, then $ldq \geq \max(1, n)$.

ldz INTEGER. The leading dimension of z ;

If $compz = 'N'$, then $ldz \geq 1$.

If $compz = 'I'$ or $'V'$, then $ldz \geq \max(1, n)$.

$lwork$ INTEGER. The dimension of the array $work$.

$lwork \geq \max(1, n)$.

If $lwork = -1$, then a workspace query is assumed; the routine only calculates the optimal size of the $work$ array, returns this value as the first entry of the $work$ array, and no error message related to $lwork$ is issued by [xerbla](#). See *Application Notes* for details.

$rwork$ REAL for `chgeqz`

DOUBLE PRECISION for `zhgeqz`.

Workspace array, size at least $\max(1, n)$. Used in complex flavors only.

Output Parameters

h

For real flavors:

If $job = 'S'$, then on exit h contains the upper quasi-triangular matrix S from the generalized Schur factorization.

If *job* = 'E', then on exit the diagonal blocks of *h* match those of *S*, but the rest of *h* is unspecified.

For complex flavors:

If *job* = 'S', then, on exit, *h* contains the upper triangular matrix *S* from the generalized Schur factorization.

If *job* = 'E', then on exit the diagonal of *h* matches that of *S*, but the rest of *h* is unspecified.

t

If *job* = 'S', then, on exit, *t* contains the upper triangular matrix *P* from the generalized Schur factorization.

For real flavors:

2-by-2 diagonal blocks of *P* corresponding to 2-by-2 blocks of *S* are reduced to positive diagonal form, that is, if *h*(*j*+1,*j*) is non-zero, then *t*(*j*+1,*j*)=*t*(*j*,*j*+1)=0 and *t*(*j*,*j*) and *t*(*j*+1,*j*+1) will be positive.

If *job* = 'E', then on exit the diagonal blocks of *t* match those of *P*, but the rest of *t* is unspecified.

For complex flavors:

if *job* = 'E', then on exit the diagonal of *t* matches that of *P*, but the rest of *t* is unspecified.

alphar, alphai

REAL for shgeqz;

DOUBLE PRECISION for dhgeqz.

Arrays, size at least max(1, *n*). The real and imaginary parts, respectively, of each scalar *alpha* defining an eigenvalue of GNEP.

If *alphai*(*j*) is zero, then the *j*-th eigenvalue is real; if positive, then the *j*-th and (*j*+1)-th eigenvalues are a complex conjugate pair, with

alphai(*j*+1) = -*alphai*(*j*).

alpha

COMPLEX for chgeqz;

DOUBLE COMPLEX for zhgeqz.

Array, size at least max(1, *n*).

The complex scalars *alpha* that define the eigenvalues of GNEP. *alphai*(*i*) = *S_{i, i}* in the generalized Schur factorization.

beta

REAL for shgeqz

DOUBLE PRECISION for dhgeqz

COMPLEX for chgeqz

DOUBLE COMPLEX for zhgeqz.

Array, size at least max(1, *n*).

For real flavors:

The scalars *beta* that define the eigenvalues of GNEP.

Together, the quantities $\alpha = (\alpha_{\text{r}}(j), \alpha_{\text{ai}}(j))$ and $\beta = \beta(j)$ represent the j -th eigenvalue of the matrix pair (A,B) , in one of the forms $\lambda = \alpha/\beta$ or $\mu = \beta/\alpha$. Since either λ or μ may overflow, they should not, in general, be computed.

For complex flavors:

The real non-negative scalars β that define the eigenvalues of GNEP.

$\beta(i) = P_{i,i}$ in the generalized Schur factorization. Together, the quantities $\alpha = \alpha(j)$ and $\beta = \beta(j)$ represent the j -th eigenvalue of the matrix pair (A,B) , in one of the forms $\lambda = \alpha/\beta$ or $\mu = \beta/\alpha$. Since either λ or μ may overflow, they should not, in general, be computed.

q	On exit, if $\text{compq} = 'I'$, q is overwritten by the orthogonal/unitary matrix of left Schur vectors of the pair (H,T) , and if $\text{compq} = 'V'$, q is overwritten by the orthogonal/unitary matrix of left Schur vectors of (A,B) .
z	On exit, if $\text{compz} = 'I'$, z is overwritten by the orthogonal/unitary matrix of right Schur vectors of the pair (H,T) , and if $\text{compz} = 'V'$, z is overwritten by the orthogonal/unitary matrix of right Schur vectors of (A,B) .
$\text{work}(1)$	If $\text{info} \geq 0$, on exit, $\text{work}(1)$ contains the minimum value of $l\text{work}$ required for optimum performance. Use this $l\text{work}$ for subsequent runs.
info	<p>INTEGER.</p> <p>If $\text{info} = 0$, the execution is successful.</p> <p>If $\text{info} = -i$, the i-th parameter had an illegal value.</p> <p>If $\text{info} = 1, \dots, n$, the QZ iteration did not converge.</p> <p>(H,T) is not in Schur form, but $\alpha_{\text{r}}(i)$, $\alpha_{\text{ai}}(i)$ (for real flavors), $\alpha(i)$ (for complex flavors), and $\beta(i)$, $i=\text{info}+1, \dots, n$ should be correct.</p> <p>If $\text{info} = n+1, \dots, 2n$, the shift calculation failed.</p> <p>(H,T) is not in Schur form, but $\alpha_{\text{r}}(i)$, $\alpha_{\text{ai}}(i)$ (for real flavors), $\alpha(i)$ (for complex flavors), and $\beta(i)$, $i=\text{info}-n+1, \dots, n$ should be correct.</p>

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `hgeqz` interface are the following:

h	Holds the matrix H of size (n,n) .
t	Holds the matrix T of size (n,n) .
α_{r}	Holds the vector of length n . Used in real flavors only.
α_{ai}	Holds the vector of length n . Used in real flavors only.
α	Holds the vector of length n . Used in complex flavors only.

<i>beta</i>	Holds the vector of length n .
<i>q</i>	Holds the matrix Q of size (n,n) .
<i>z</i>	Holds the matrix Z of size (n,n) .
<i>ilo</i>	Default value for this argument is $ilo = 1$.
<i>ihi</i>	Default value for this argument is $ihi = n$.
<i>job</i>	Must be 'E' or 'S'. The default value is 'E'.
<i>compq</i>	<p>If omitted, this argument is restored based on the presence of argument q as follows:</p> <p>$compq = 'I'$, if q is present,</p> <p>$compq = 'N'$, if q is omitted.</p> <p>If present, $compq$ must be equal to 'I' or 'V' and the argument q must also be present.</p> <p>Note that there will be an error condition if $compq$ is present and q omitted.</p>
<i>compz</i>	<p>If omitted, this argument is restored based on the presence of argument z as follows:</p> <p>$compz = 'I'$, if z is present,</p> <p>$compz = 'N'$, if z is omitted.</p> <p>If present, $compz$ must be equal to 'I' or 'V' and the argument z must also be present.</p> <p>Note an error condition if $compz$ is present and z is omitted.</p>

Application Notes

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set $lwork = -1$.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value ($work(1)$) for subsequent runs.

If you set $lwork = -1$, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?tgevc

Computes some or all of the right and/or left generalized eigenvectors of a pair of upper triangular matrices.

Syntax

call stgevc(*side*, *howmny*, *select*, *n*, *s*, *lds*, *p*, *ldp*, *vl*, *ldvl*, *vr*, *ldvr*, *mm*, *m*, *work*, *info*)

```
call dtgevc(side, howmny, select, n, s, lds, p, ldp, vl, ldvl, vr, ldvr, mm, m, work,
info)

call ctgevc(side, howmny, select, n, s, lds, p, ldp, vl, ldvl, vr, ldvr, mm, m, work,
rwork, info)

call ztgevc(side, howmny, select, n, s, lds, p, ldp, vl, ldvl, vr, ldvr, mm, m, work,
rwork, info)

call tgevc(s, p [,howmny] [,select] [,vl] [,vr] [,m] [,info])
```

Include Files

Description

The routine computes some or all of the right and/or left eigenvectors of a pair of real/complex matrices (S,P) , where S is quasi-triangular (for real flavors) or upper triangular (for complex flavors) and P is upper triangular.

Matrix pairs of this type are produced by the generalized Schur factorization of a real/complex matrix pair (A,B) :

$$A = Q^* S^* Z^H, B = Q^* P^* Z^H$$

as computed by ?gghrd plus ?hgeqz.

The right eigenvector x and the left eigenvector y of (S,P) corresponding to an eigenvalue w are defined by:

$$S^* x = w^* P^* x, y^H S = w^* y^H P$$

The eigenvalues are not input to this routine, but are computed directly from the diagonal blocks or diagonal elements of S and P .

This routine returns the matrices X and/or Y of right and left eigenvectors of (S,P) , or the products $Z^* X$ and/or $Q^* Y$, where Z and Q are input matrices.

If Q and Z are the orthogonal/unitary factors from the generalized Schur factorization of a matrix pair (A,B) , then $Z^* X$ and $Q^* Y$ are the matrices of right and left eigenvectors of (A,B) .

Input Parameters

<i>side</i>	<p>CHARACTER*1. Must be 'R', 'L', or 'B'.</p> <p>If <i>side</i> = 'R', compute right eigenvectors only.</p> <p>If <i>side</i> = 'L', compute left eigenvectors only.</p> <p>If <i>side</i> = 'B', compute both right and left eigenvectors.</p>
<i>howmny</i>	<p>CHARACTER*1. Must be 'A', 'B', or 'S'.</p> <p>If <i>howmny</i> = 'A', compute all right and/or left eigenvectors.</p> <p>If <i>howmny</i> = 'B', compute all right and/or left eigenvectors, backtransformed by the matrices in <i>vr</i> and/or <i>vl</i>.</p> <p>If <i>howmny</i> = 'S', compute selected right and/or left eigenvectors, specified by the logical array <i>select</i>.</p>
<i>select</i>	<p>LOGICAL.</p> <p>Array, size at least max (1, <i>n</i>).</p> <p>If <i>howmny</i> = 'S', <i>select</i> specifies the eigenvectors to be computed.</p>

If *howmny* = 'A' or 'B', *select* is not referenced.

For real flavors:

If *w(j)* is a real eigenvalue, the corresponding real eigenvector is computed if *select(j)* is .TRUE..

If *w(j)* and *omega(j + 1)* are the real and imaginary parts of a complex eigenvalue, the corresponding complex eigenvector is computed if either *select(j)* or *select(j + 1)* is .TRUE., and on exit *select(j)* is set to .TRUE. and *select(j + 1)* is set to .FALSE..

For complex flavors:

The eigenvector corresponding to the *j*-th eigenvalue is computed if *select(j)* is .TRUE..

n

INTEGER. The order of the matrices *S* and *P* ($n \geq 0$).

s, p, vl, vr, work

REAL for *stgevc*

DOUBLE PRECISION for *dtgevc*

COMPLEX for *ctgevc*

DOUBLE COMPLEX for *ztgevc*.

Arrays:

s(lds,)* contains the matrix *S* from a generalized Schur factorization as computed by ?hgeqz. This matrix is upper quasi-triangular for real flavors, and upper triangular for complex flavors.

The second dimension of *s* must be at least $\max(1, n)$.

p(ldp,)* contains the upper triangular matrix *P* from a generalized Schur factorization as computed by ?hgeqz.

For real flavors, 2-by-2 diagonal blocks of *P* corresponding to 2-by-2 blocks of *S* must be in positive diagonal form.

For complex flavors, *P* must have real diagonal elements. The second dimension of *p* must be at least $\max(1, n)$.

If *side* = 'L' or 'B' and *howmny* = 'B', *vl(ldvl,*)* must contain an *n*-by-*n* matrix *Q* (usually the orthogonal/unitary matrix *Q* of left Schur vectors returned by ?hgeqz). The second dimension of *vl* must be at least $\max(1, mm)$.

If *side* = 'R', *vl* is not referenced.

If *side* = 'R' or 'B' and *howmny* = 'B', *vr(ldvr,*)* must contain an *n*-by-*n* matrix *Z* (usually the orthogonal/unitary matrix *Z* of right Schur vectors returned by ?hgeqz). The second dimension of *vr* must be at least $\max(1, mm)$.

If *side* = 'L', *vr* is not referenced.

work()* is a workspace array.

size at least $\max(1, 6*n)$ for real flavors and at least $\max(1, 2*n)$ for complex flavors.

lds

INTEGER. The leading dimension of *s*; at least $\max(1, n)$.

<i>ldp</i>	INTEGER. The leading dimension of p ; at least $\max(1, n)$.
<i>ldvl</i>	INTEGER. The leading dimension of vl ; If <i>side</i> = 'L' or 'B', then $ldvl \geq n$. If <i>side</i> = 'R', then $ldvl \geq 1$.
<i>ldvr</i>	INTEGER. The leading dimension of vr ; If <i>side</i> = 'R' or 'B', then $ldvr \geq n$. If <i>side</i> = 'L', then $ldvr \geq 1$.
<i>mm</i>	INTEGER. The number of columns in the arrays vl and/or vr ($mm \geq m$).
<i>rwork</i>	REAL for <i>ctgevc</i> DOUBLE PRECISION for <i>ztgevc</i> . Workspace array, size at least $\max(1, 2*n)$. Used in complex flavors only.

Output Parameters

<i>vl</i>	<p>On exit, if <i>side</i> = 'L' or 'B', vl contains:</p> <p>if <i>howmny</i> = 'A', the matrix Y of left eigenvectors of (S,P);</p> <p>if <i>howmny</i> = 'B', the matrix $Q*Y$;</p> <p>if <i>howmny</i> = 'S', the left eigenvectors of (S,P) specified by <i>select</i>, stored consecutively in the columns of vl, in the same order as their eigenvalues.</p> <p><i>For real flavors:</i></p> <p>A complex eigenvector corresponding to a complex eigenvalue is stored in two consecutive columns, the first holding the real part, and the second the imaginary part.</p>
<i>vr</i>	<p>On exit, if <i>side</i> = 'R' or 'B', vr contains:</p> <p>if <i>howmny</i> = 'A', the matrix X of right eigenvectors of (S,P);</p> <p>if <i>howmny</i> = 'B', the matrix $Z*X$;</p> <p>if <i>howmny</i> = 'S', the right eigenvectors of (S,P) specified by <i>select</i>, stored consecutively in the columns of vr, in the same order as their eigenvalues.</p> <p><i>For real flavors:</i></p> <p>A complex eigenvector corresponding to a complex eigenvalue is stored in two consecutive columns, the first holding the real part, and the second the imaginary part.</p>
<i>m</i>	<p>INTEGER. The number of columns in the arrays vl and/or vr actually used to store the eigenvectors.</p> <p>If <i>howmny</i> = 'A' or 'B', m is set to n.</p> <p><i>For real flavors:</i></p> <p>Each selected real eigenvector occupies one column and each selected complex eigenvector occupies two columns.</p> <p><i>For complex flavors:</i></p> <p>Each selected eigenvector occupies one column.</p>

info INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

For real flavors:

if *info* = *i*>0, the 2-by-2 block (*i*:*i*+1) does not have a complex eigenvalue.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `tgexc` interface are the following:

<i>s</i>	Holds the matrix <i>S</i> of size (<i>n</i> , <i>n</i>).
<i>p</i>	Holds the matrix <i>P</i> of size (<i>n</i> , <i>n</i>).
<i>select</i>	Holds the vector of length <i>n</i> .
<i>vl</i>	Holds the matrix <i>VL</i> of size (<i>n</i> , <i>mm</i>).
<i>vr</i>	Holds the matrix <i>VR</i> of size (<i>n</i> , <i>mm</i>).
<i>side</i>	<p>Restored based on the presence of arguments <i>vl</i> and <i>vr</i> as follows:</p> <p><i>side</i> = 'B', if both <i>vl</i> and <i>vr</i> are present,</p> <p><i>side</i> = 'L', if <i>vl</i> is present and <i>vr</i> omitted,</p> <p><i>side</i> = 'R', if <i>vl</i> is omitted and <i>vr</i> present,</p> <p>Note that there will be an error condition if both <i>vl</i> and <i>vr</i> are omitted.</p>
<i>howmny</i>	<p>If omitted, this argument is restored based on the presence of argument <i>select</i> as follows:</p> <p><i>howmny</i> = 'S', if <i>select</i> is present,</p> <p><i>howmny</i> = 'A', if <i>select</i> is omitted.</p> <p>If present, <i>howmny</i> must be equal to 'A' or 'B' and the argument <i>select</i> must be omitted.</p> <p>Note that there will be an error condition if both <i>howmny</i> and <i>select</i> are present.</p>

?tgexc

Reorders the generalized Schur decomposition of a pair of matrices (A,B) so that one diagonal block of (A,B) moves to another row index.

Syntax

```
call stgexc(wantq, wantz, n, a, lda, b, ldb, q, ldq, z, ldz, ifst, ilst, work, lwork, info)

call dtgexc(wantq, wantz, n, a, lda, b, ldb, q, ldq, z, ldz, ifst, ilst, work, lwork, info)

call ctgexc(wantq, wantz, n, a, lda, b, ldb, q, ldq, z, ldz, ifst, ilst, info)
```

```
call ztgexc(wantq, wantz, n, a, lda, b, ldb, q, ldq, z, ldz, ifst, ilst, info)
call tgevc(a, b [,ifst] [,ilst] [,z] [,q] [,info])
```

Include Files

- `mkl.fi`, `lapack.f90`

Description

The routine reorders the generalized real-Schur/Schur decomposition of a real/complex matrix pair (A, B) using an orthogonal/unitary equivalence transformation

$$(A, B) = Q^* (A, B) * Z^H,$$

so that the diagonal block of (A, B) with row index *ifst* is moved to row *ilst*. Matrix pair (A, B) must be in a generalized real-Schur/Schur canonical form (as returned by [gges](#)), that is, A is block upper triangular with 1-by-1 and 2-by-2 diagonal blocks and B is upper triangular. Optionally, the matrices Q and Z of generalized Schur vectors are updated.

$$Q_{in} * A_{in} * Z_{in}^T = Q_{out} * A_{out} * Z_{out}^T$$

$$Q_{in} * B_{in} * Z_{in}^T = Q_{out} * B_{out} * Z_{out}^T.$$

Input Parameters

wantq, wantz LOGICAL.
 If *wantq* = `.TRUE.`, update the left transformation matrix Q ;
 If *wantq* = `.FALSE.`, do not update Q ;
 If *wantz* = `.TRUE.`, update the right transformation matrix Z ;
 If *wantz* = `.FALSE.`, do not update Z .

n INTEGER. The order of the matrices A and B ($n \geq 0$).

a, b, q, z REAL for `stgexc`
 DOUBLE PRECISION for `dtgexc`
 COMPLEX for `ctgexc`
 DOUBLE COMPLEX for `ztgexc`.

Arrays:
a(lda,)* contains the matrix A .
 The second dimension of *a* must be at least $\max(1, n)$.
b(ldb,)* contains the matrix B . The second dimension of *b* must be at least $\max(1, n)$.
q(ldq,)*
 If *wantq* = `.FALSE.`, then *q* is not referenced.
 If *wantq* = `.TRUE.`, then *q* must contain the orthogonal/unitary matrix Q .
 The second dimension of *q* must be at least $\max(1, n)$.
z(ldz,)*
 If *wantz* = `.FALSE.`, then *z* is not referenced.
 If *wantz* = `.TRUE.`, then *z* must contain the orthogonal/unitary matrix Z .

	The second dimension of z must be at least $\max(1, n)$.
<i>lda</i>	INTEGER. The leading dimension of a ; at least $\max(1, n)$.
<i>ldb</i>	INTEGER. The leading dimension of b ; at least $\max(1, n)$.
<i>ldq</i>	INTEGER. The leading dimension of q ; If <i>wantq</i> = .FALSE., then <i>ldq</i> ≥ 1 . If <i>wantq</i> = .TRUE., then <i>ldq</i> $\geq \max(1, n)$.
<i>ldz</i>	INTEGER. The leading dimension of z ; If <i>wantz</i> = .FALSE., then <i>ldz</i> ≥ 1 . If <i>wantz</i> = .TRUE., then <i>ldz</i> $\geq \max(1, n)$.
<i>ifst, ilst</i>	INTEGER. Specify the reordering of the diagonal blocks of (A, B) . The block with row index <i>ifst</i> is moved to row <i>ilst</i> , by a sequence of swapping between adjacent blocks. Constraint: $1 \leq ifst, ilst \leq n$.
<i>work</i>	REAL for <i>stgexc</i> ; DOUBLE PRECISION for <i>dtgexc</i> . Workspace array, size (<i>lwork</i>). Used in real flavors only.
<i>lwork</i>	INTEGER. The dimension of <i>work</i> ; must be at least $4n + 16$. If <i>lwork</i> = -1, then a workspace query is assumed; the routine only calculates the optimal size of the <i>work</i> array, returns this value as the first entry of the <i>work</i> array, and no error message related to <i>lwork</i> is issued by xerbla . See <i>Application Notes</i> for details.

Output Parameters

a, b, q, z	Overwritten by the updated matrices A, B, Q , and Z respectively.
<i>ifst, ilst</i>	Overwritten for real flavors only. If <i>ifst</i> pointed to the second row of a 2 by 2 block on entry, it is changed to point to the first row; <i>ilst</i> always points to the first row of the block in its final position (which may differ from its input value by ± 1).
<i>info</i>	INTEGER. If <i>info</i> = 0, the execution is successful. If <i>info</i> = - <i>i</i> , the <i>i</i> -th parameter had an illegal value. If <i>info</i> = 1, the transformed matrix pair (A, B) would be too far from generalized Schur form; the problem is ill-conditioned. (A, B) may have been partially reordered, and <i>ilst</i> points to the first row of the current position of the block being moved.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `tgexc` interface are the following:

<code>a</code>	Holds the matrix A of size (n,n) .
<code>b</code>	Holds the matrix B of size (n,n) .
<code>z</code>	Holds the matrix Z of size (n,n) .
<code>q</code>	Holds the matrix Q of size (n,n) .
<code>wantq</code>	Restored based on the presence of the argument <code>q</code> as follows: <code>wantq</code> = <code>.TRUE</code> , if <code>q</code> is present, <code>wantq</code> = <code>.FALSE</code> , if <code>q</code> is omitted.
<code>wantz</code>	Restored based on the presence of the argument <code>z</code> as follows: <code>wantz</code> = <code>.TRUE</code> , if <code>z</code> is present, <code>wantz</code> = <code>.FALSE</code> , if <code>z</code> is omitted.

Application Notes

If it is not clear how much workspace to supply, use a generous value of `lwork` for the first run, or set `lwork` = -1.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array `work` on exit. Use this value (`work(1)`) for subsequent runs.

If `lwork` = -1, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (`work`). This operation is called a workspace query.

Note that if `lwork` is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?tgsen

Reorders the generalized Schur decomposition of a pair of matrices (A,B) so that a selected cluster of eigenvalues appears in the leading diagonal blocks of (A,B) .

Syntax

```
call stgsen(ijob, wantq, wantz, select, n, a, lda, b, ldb, alphas, alphas, beta, q,
ldq, z, ldz, m, pl, pr, dif, work, lwork, iwork, liwork, info)

call dtgsen(ijob, wantq, wantz, select, n, a, lda, b, ldb, alphas, alphas, beta, q,
ldq, z, ldz, m, pl, pr, dif, work, lwork, iwork, liwork, info)

call ctgsen(ijob, wantq, wantz, select, n, a, lda, b, ldb, alpha, beta, q, ldq, z,
ldz, m, pl, pr, dif, work, lwork, iwork, liwork, info)

call ztgsen(ijob, wantq, wantz, select, n, a, lda, b, ldb, alpha, beta, q, ldq, z,
ldz, m, pl, pr, dif, work, lwork, iwork, liwork, info)

call tgsen(a, b, select [,alphas] [,alphas] [,beta] [,ijob] [,q] [,z] [,pl] [,pr] [,dif]
[,m] [,info])

call tgsen(a, b, select [,alpha] [,beta] [,ijob] [,q] [,z] [,pl] [,pr] [, dif] [,m]
[,info])
```

Include Files

- `mkl.fi`, `lapack.f90`

Description

The routine reorders the generalized real-Schur/Schur decomposition of a real/complex matrix pair (A, B) (in terms of an orthogonal/unitary equivalence transformation $Q^{T*}(A, B)Z$ for real flavors or $Q^{H*}(A, B)Z$ for complex flavors), so that a selected cluster of eigenvalues appears in the leading diagonal blocks of the pair (A, B) . The leading columns of Q and Z form orthonormal/unitary bases of the corresponding left and right eigenspaces (deflating subspaces).

(A, B) must be in generalized real-Schur/Schur canonical form (as returned by [gges](#)), that is, A and B are both upper triangular.

`?tgsen` also computes the generalized eigenvalues

$\omega_j = (\text{alphar}(j) + \text{alphai}(j)*i)/\text{beta}(j)$ (for real flavors)

$\omega_j = \text{alpha}(j)/\text{beta}(j)$ (for complex flavors)

of the reordered matrix pair (A, B) .

Optionally, the routine computes the estimates of reciprocal condition numbers for eigenvalues and eigenspaces. These are `Difu[(A11, B11), (A22, B22)]` and `Difl[(A11, B11), (A22, B22)]`, that is, the separation(s) between the matrix pairs (A_{11}, B_{11}) and (A_{22}, B_{22}) that correspond to the selected cluster and the eigenvalues outside the cluster, respectively, and norms of "projections" onto left and right eigenspaces with respect to the selected cluster in the (1,1)-block.

Input Parameters

<i>ijob</i>	<p>INTEGER. Specifies whether condition numbers are required for the cluster of eigenvalues (<i>pl</i> and <i>pr</i>) or the deflating subspaces <code>Difu</code> and <code>Difl</code>.</p> <p>If <i>ijob</i> = 0, only reorder with respect to <i>select</i>;</p> <p>If <i>ijob</i> = 1, reciprocal of norms of "projections" onto left and right eigenspaces with respect to the selected cluster (<i>pl</i> and <i>pr</i>);</p> <p>If <i>ijob</i> = 2, compute upper bounds on <code>Difu</code> and <code>Difl</code>, using F-norm-based estimate (<code>dif(1:2)</code>);</p> <p>If <i>ijob</i> = 3, compute estimate of <code>Difu</code> and <code>Difl</code>, using 1-norm-based estimate (<code>dif(1:2)</code>). This option is about 5 times as expensive as <i>ijob</i> = 2;</p> <p>If <i>ijob</i> = 4, compute <i>pl</i>, <i>pr</i> and <i>dif</i> (i.e., options 0, 1 and 2 above). This is an economic version to get it all;</p> <p>If <i>ijob</i> = 5, compute <i>pl</i>, <i>pr</i> and <i>dif</i> (i.e., options 0, 1 and 3 above).</p>
<i>wantq</i> , <i>wantz</i>	<p>LOGICAL.</p> <p>If <i>wantq</i> = <code>.TRUE.</code>, update the left transformation matrix Q;</p> <p>If <i>wantq</i> = <code>.FALSE.</code>, do not update Q;</p> <p>If <i>wantz</i> = <code>.TRUE.</code>, update the right transformation matrix Z;</p> <p>If <i>wantz</i> = <code>.FALSE.</code>, do not update Z.</p>
<i>select</i>	<p>LOGICAL.</p> <p>Array, size at least $\max(1, n)$. Specifies the eigenvalues in the selected cluster.</p>

To select an eigenvalue ω_j , *select(j)* must be `.TRUE.` *For real flavors:* to select a complex conjugate pair of eigenvalues ω_j and ω_{j+1} (corresponding 2 by 2 diagonal block), *select(j)* and/or *select(j + 1)* must be set to `.TRUE.`; the complex conjugate ω_j and ω_{j+1} must be either both included in the cluster or both excluded.

n INTEGER. The order of the matrices *A* and *B* ($n \geq 0$).

a, *b*, *q*, *z*, *work* REAL for stgsen

DOUBLE PRECISION for dtgsen

COMPLEX for ctgsen

DOUBLE COMPLEX for ztgsen.

Arrays:

a(lda,)* contains the matrix *A*.

For real flavors: *A* is upper quasi-triangular, with (*A*, *B*) in generalized real Schur canonical form.

For complex flavors: *A* is upper triangular, in generalized Schur canonical form.

The second dimension of *a* must be at least $\max(1, n)$.

b(ldb,)* contains the matrix *B*.

For real flavors: *B* is upper triangular, with (*A*, *B*) in generalized real Schur canonical form.

For complex flavors: *B* is upper triangular, in generalized Schur canonical form. The second dimension of *b* must be at least $\max(1, n)$.

q(ldq,)*

If *wantq* = `.TRUE.`, then *q* is an *n*-by-*n* matrix;

If *wantq* = `.FALSE.`, then *q* is not referenced.

The second dimension of *q* must be at least $\max(1, n)$.

z(ldz,)*

If *wantz* = `.TRUE.`, then *z* is an *n*-by-*n* matrix;

If *wantz* = `.FALSE.`, then *z* is not referenced.

The second dimension of *z* must be at least $\max(1, n)$.

work is a workspace array, its dimension $\max(1, lwork)$.

lda INTEGER. The leading dimension of *a*; at least $\max(1, n)$.

ldb INTEGER. The leading dimension of *b*; at least $\max(1, n)$.

ldq INTEGER. The leading dimension of *q*; $ldq \geq 1$.

If *wantq* = `.TRUE.`, then $ldq \geq \max(1, n)$.

ldz INTEGER. The leading dimension of *z*; $ldz \geq 1$.

If *wantz* = `.TRUE.`, then $ldz \geq \max(1, n)$.

lwork INTEGER. The dimension of the array *work*.

For real flavors:

If $ijob = 1, 2, \text{ or } 4$, $lwork \geq \max(4n+16, 2m(n-m))$.

If $ijob = 3 \text{ or } 5$, $lwork \geq \max(4n+16, 4m(n-m))$.

For complex flavors:

If $ijob = 1, 2, \text{ or } 4$, $lwork \geq \max(1, 2m(n-m))$.

If $ijob = 3 \text{ or } 5$, $lwork \geq \max(1, 4m(n-m))$.

If $lwork = -1$, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by [xerbla](#). See *Application Notes* for details.

iwork INTEGER. Workspace array, its dimension $\max(1, liwork)$.

liwork INTEGER. The dimension of the array *iwork*.

For real flavors:

If $ijob = 1, 2, \text{ or } 4$, $liwork \geq n+6$.

If $ijob = 3 \text{ or } 5$, $liwork \geq \max(n+6, 2m(n-m))$.

For complex flavors:

If $ijob = 1, 2, \text{ or } 4$, $liwork \geq n+2$.

If $ijob = 3 \text{ or } 5$, $liwork \geq \max(n+2, 2m(n-m))$.

If $liwork = -1$, then a workspace query is assumed; the routine only calculates the optimal size of the *iwork* array, returns this value as the first entry of the *iwork* array, and no error message related to *liwork* is issued by [xerbla](#). See *Application Notes* for details.

Output Parameters

a, b Overwritten by the reordered matrices *A* and *B*, respectively.

alphar, alphai REAL for stgsen;
DOUBLE PRECISION for dtgsen.
Arrays, size at least $\max(1, n)$. Contain values that form generalized eigenvalues in real flavors.
See *beta*.

alpha COMPLEX for ctgsen;
DOUBLE COMPLEX for ztgsen.
Array, size at least $\max(1, n)$. Contain values that form generalized eigenvalues in complex flavors.
See *beta*.

beta REAL for stgsen
DOUBLE PRECISION for dtgsen
COMPLEX for ctgsen

DOUBLE COMPLEX for ztgse.

Array, size at least $\max(1, n)$.

For real flavors:

On exit, $(\text{alphar}(j) + \text{alphai}(j)*i)/\text{beta}(j)$, $j=1, \dots, n$, will be the generalized eigenvalues.

$\text{alphar}(j) + \text{alphai}(j)*i$ and $\text{beta}(j)$, $j=1, \dots, n$ are the diagonals of the complex Schur form (S, T) that would result if the 2-by-2 diagonal blocks of the real generalized Schur form of (A, B) were further reduced to triangular form using complex unitary transformations.

If $\text{alphai}(j)$ is zero, then the j -th eigenvalue is real; if positive, then the j -th and $(j + 1)$ -st eigenvalues are a complex conjugate pair, with $\text{alphai}(j + 1)$ negative.

For complex flavors:

The diagonal elements of A and B , respectively, when the pair (A, B) has been reduced to generalized Schur form. $\text{alpha}(i)/\text{beta}(i)$, $i=1, \dots, n$ are the generalized eigenvalues.

q

If $\text{wantq} = \text{.TRUE.}$, then, on exit, Q has been postmultiplied by the left orthogonal transformation matrix which reorder (A, B) . The leading m columns of Q form orthonormal bases for the specified pair of left eigenspaces (deflating subspaces).

z

If $\text{wantz} = \text{.TRUE.}$, then, on exit, Z has been postmultiplied by the left orthogonal transformation matrix which reorder (A, B) . The leading m columns of Z form orthonormal bases for the specified pair of left eigenspaces (deflating subspaces).

m

INTEGER.

The dimension of the specified pair of left and right eigen-spaces (deflating subspaces); $0 \leq m \leq n$.

pl, pr

REAL for single precision flavors;

DOUBLE PRECISION for double precision flavors.

If $i\text{job} = 1, 4$, or 5 , pl and pr are lower bounds on the reciprocal of the norm of "projections" onto left and right eigenspaces with respect to the selected cluster.

$0 < pl, pr \leq 1$. If $m = 0$ or $m = n$, $pl = pr = 1$.

If $i\text{job} = 0, 2$ or 3 , pl and pr are not referenced

dif

REAL for single precision flavors; DOUBLE PRECISION for double precision flavors.

Array, size (2).

If $i\text{job} \geq 2$, $dif(1:2)$ store the estimates of $Difu$ and $Difl$.

If $i\text{job} = 2$ or 4 , $dif(1:2)$ are F-norm-based upper bounds on $Difu$ and $Difl$.

If $i\text{job} = 3$ or 5 , $dif(1:2)$ are 1-norm-based estimates of $Difu$ and $Difl$.

If $m = 0$ or $m = n$, $dif(1:2) = \text{F-norm}([A, B])$.

If $ijob = 0$ or 1 , dif is not referenced.

$work(1)$ If $ijob$ is not 0 and $info = 0$, on exit, $work(1)$ contains the minimum value of $lwork$ required for optimum performance. Use this $lwork$ for subsequent runs.

$iwork(1)$ If $ijob$ is not 0 and $info = 0$, on exit, $iwork(1)$ contains the minimum value of $liwork$ required for optimum performance. Use this $liwork$ for subsequent runs.

$info$ INTEGER.

If $info = 0$, the execution is successful.

If $info = -i$, the i -th parameter had an illegal value.

If $info = 1$, Reordering of (A, B) failed because the transformed matrix pair (A, B) would be too far from generalized Schur form; the problem is very ill-conditioned. (A, B) may have been partially reordered.

If $ijob > 0$, 0 is returned in dif , pl and pr .

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `tgseqn` interface are the following:

a	Holds the matrix A of size (n,n) .
b	Holds the matrix B of size (n,n) .
$select$	Holds the vector of length n .
$alphar$	Holds the vector of length n . Used in real flavors only.
$alpha_i$	Holds the vector of length n . Used in real flavors only.
$alpha$	Holds the vector of length n . Used in complex flavors only.
$beta$	Holds the vector of length n .
q	Holds the matrix Q of size (n,n) .
z	Holds the matrix Z of size (n,n) .
dif	Holds the vector of length (2) .
$ijob$	Must be 0 , 1 , 2 , 3 , 4 , or 5 . The default value is 0 .
$wantq$	Restored based on the presence of the argument q as follows: $wantq = .TRUE.$, if q is present, $wantq = .FALSE.$, if q is omitted.
$wantz$	Restored based on the presence of the argument z as follows: $wantz = .TRUE.$, if z is present,

`wantz = .FALSE`, if `z` is omitted.

Application Notes

If it is not clear how much workspace to supply, use a generous value of `lwork` (or `liwork`) for the first run or set `lwork = -1` (`liwork = -1`).

If `lwork` (or `liwork`) has any of admissible sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (`work`, `iwork`) on exit. Use this value (`work(1)`, `iwork(1)`) for subsequent runs.

If `lwork = -1` (`liwork = -1`), the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (`work`, `iwork`). This operation is called a workspace query.

Note that if `lwork` (`liwork`) is less than the minimal required value and is not equal to -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?tgsyl

Solves the generalized Sylvester equation.

Syntax

```
call stgsyl(trans, ijob, m, n, a, lda, b, ldb, c, ldc, d, ldd, e, lde, f, ldf, scale,
dif, work, lwork, iwork, info)
```

```
call dtgsyl(trans, ijob, m, n, a, lda, b, ldb, c, ldc, d, ldd, e, lde, f, ldf, scale,
dif, work, lwork, iwork, info)
```

```
call ctgsyl(trans, ijob, m, n, a, lda, b, ldb, c, ldc, d, ldd, e, lde, f, ldf, scale,
dif, work, lwork, iwork, info)
```

```
call ztgsyl(trans, ijob, m, n, a, lda, b, ldb, c, ldc, d, ldd, e, lde, f, ldf, scale,
dif, work, lwork, iwork, info)
```

```
call tgsyl(a, b, c, d, e, f [,ijob] [,trans] [,scale] [,dif] [,info])
```

Include Files

- `mkl.fi`, `lapack.f90`

Description

The routine solves the generalized Sylvester equation:

$$A^*R - L^*B = scale^*C$$

$$D^*R - L^*E = scale^*F$$

where R and L are unknown m -by- n matrices, (A, D) , (B, E) and (C, F) are given matrix pairs of size m -by- m , n -by- n and m -by- n , respectively, with real/complex entries. (A, D) and (B, E) must be in generalized real-Schur/Schur canonical form, that is, A, B are upper quasi-triangular/triangular and D, E are upper triangular.

The solution (R, L) overwrites (C, F) . The factor `scale`, $0 \leq scale \leq 1$, is an output scaling factor chosen to avoid overflow.

In matrix notation the above equation is equivalent to the following: solve $Z^*x = scale^*b$, where Z is defined as

$$Z = \begin{pmatrix} \text{kron}(I_n, A) & -\text{kron}(B^T, I_m) \\ \text{kron}(I_n, D) & -\text{kron}(E^T, I_m) \end{pmatrix}$$

Here I_k is the identity matrix of size k and X^T is the transpose/conjugate-transpose of X . $kron(X, Y)$ is the Kronecker product between the matrices X and Y .

If $trans = 'T'$ (for real flavors), or $trans = 'C'$ (for complex flavors), the routine `?tgsyl` solves the transposed/conjugate-transposed system $Z^T * Y = scale * b$, which is equivalent to solve for R and L in

$$A^T * R + D^T * L = scale * C$$

$$R * B^T + L * E^T = scale * (-F)$$

This case ($trans = 'T'$ for `stgsyl/dtgsyl` or $trans = 'C'$ for `ctgsyl/ztgsyl`) is used to compute an one-norm-based estimate of $Dif[(A, D), (B, E)]$, the separation between the matrix pairs (A, D) and (B, E) , using [lacon/lacon](#).

If $ijob \geq 1$, `?tgsyl` computes a Frobenius norm-based estimate of $Dif[(A, D), (B, E)]$. That is, the reciprocal of a lower bound on the reciprocal of the smallest singular value of Z . This is a level 3 BLAS algorithm.

Input Parameters

<i>trans</i>	<p>CHARACTER*1. Must be 'N', 'T', or 'C'.</p> <p>If $trans = 'N'$, solve the generalized Sylvester equation.</p> <p>If $trans = 'T'$, solve the 'transposed' system (for real flavors only).</p> <p>If $trans = 'C'$, solve the 'conjugate transposed' system (for complex flavors only).</p>
<i>ijob</i>	<p>INTEGER. Specifies what kind of functionality to be performed:</p> <p>If $ijob = 0$, solve the generalized Sylvester equation only;</p> <p>If $ijob = 1$, perform the functionality of $ijob = 0$ and $ijob = 3$;</p> <p>If $ijob = 2$, perform the functionality of $ijob = 0$ and $ijob = 4$;</p> <p>If $ijob = 3$, only an estimate of $Dif[(A, D), (B, E)]$ is computed (look ahead strategy is used);</p> <p>If $ijob = 4$, only an estimate of $Dif[(A, D), (B, E)]$ is computed (?gecon on sub-systems is used). If $trans = 'T'$ or 'C', $ijob$ is not referenced.</p>
<i>m</i>	<p>INTEGER. The order of the matrices A and D, and the row dimension of the matrices C, F, R and L.</p>
<i>n</i>	<p>INTEGER. The order of the matrices B and E, and the column dimension of the matrices C, F, R and L.</p>
<i>a, b, c, d, e, f, work</i>	<p>REAL for <code>stgsyl</code></p> <p>DOUBLE PRECISION for <code>dtgsyl</code></p> <p>COMPLEX for <code>ctgsyl</code></p> <p>DOUBLE COMPLEX for <code>ztgsyl</code>.</p> <p>Arrays:</p> <p>$a(lda,*)$ contains the upper quasi-triangular (for real flavors) or upper triangular (for complex flavors) matrix A.</p> <p>The second dimension of a must be at least $\max(1, m)$.</p>

$b(l_{db},*)$ contains the upper quasi-triangular (for real flavors) or upper triangular (for complex flavors) matrix B . The second dimension of b must be at least $\max(1, n)$.

$c(l_{dc},*)$ contains the right-hand-side of the first matrix equation in the generalized Sylvester equation (as defined by *trans*)

The second dimension of c must be at least $\max(1, n)$.

$d(l_{dd},*)$ contains the upper triangular matrix D .

The second dimension of d must be at least $\max(1, m)$.

$e(l_{de},*)$ contains the upper triangular matrix E .

The second dimension of e must be at least $\max(1, n)$.

$f(l_{df},*)$ contains the right-hand-side of the second matrix equation in the generalized Sylvester equation (as defined by *trans*)

The second dimension of f must be at least $\max(1, n)$.

work is a workspace array, its dimension $\max(1, l_{work})$.

lda INTEGER. The leading dimension of a ; at least $\max(1, m)$.

ldb INTEGER. The leading dimension of b ; at least $\max(1, n)$.

ldc INTEGER. The leading dimension of c ; at least $\max(1, m)$.

ldd INTEGER. The leading dimension of d ; at least $\max(1, m)$.

lde INTEGER. The leading dimension of e ; at least $\max(1, n)$.

ldf INTEGER. The leading dimension of f ; at least $\max(1, m)$.

lwork INTEGER.

The dimension of the array *work*. $l_{work} \geq 1$.

If $i_{job} = 1$ or 2 and $trans = 'N'$, $l_{work} \geq \max(1, 2*m*n)$.

If $l_{work} = -1$, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by [xerbla](#). See *Application Notes* for details.

iwork INTEGER. Workspace array, size at least $(m+n+6)$ for real flavors, and at least $(m+n+2)$ for complex flavors.

Output Parameters

c If $i_{job}=0, 1$, or 2 , overwritten by the solution R .
If $i_{job}=3$ or 4 and $trans = 'N'$, c holds R , the solution achieved during the computation of the Dif-estimate.

f If $i_{job}=0, 1$, or 2 , overwritten by the solution L .
If $i_{job}=3$ or 4 and $trans = 'N'$, f holds L , the solution achieved during the computation of the Dif-estimate.

dif REAL for single-precision flavors

DOUBLE PRECISION for double-precision flavors.

On exit, *dif* is the reciprocal of a lower bound of the reciprocal of the Dif-function, that is, *dif* is an upper bound of $\text{Dif}[(A, D), (B, E)] = \sigma_{\min}(Z)$, where *Z* as defined in the description.

If *ijob* = 0, or *trans* = 'T' (for real flavors), or *trans* = 'C' (for complex flavors), *dif* is not touched.

scale

REAL for single-precision flavors

DOUBLE PRECISION for double-precision flavors.

On exit, *scale* is the scaling factor in the generalized Sylvester equation.

If $0 < \text{scale} < 1$, *c* and *f* hold the solutions *R* and *L*, respectively, to a slightly perturbed system but the input matrices *A*, *B*, *D* and *E* have not been changed.

If *scale* = 0, *c* and *f* hold the solutions *R* and *L*, respectively, to the homogeneous system with *C* = *F* = 0. Normally, *scale* = 1.

work(1)

If *info* = 0, *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

info

INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* > 0, (*A*, *D*) and (*B*, *E*) have common or close eigenvalues.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `tg syl` interface are the following:

<i>a</i>	Holds the matrix <i>A</i> of size (<i>m</i> , <i>m</i>).
<i>b</i>	Holds the matrix <i>B</i> of size (<i>n</i> , <i>n</i>).
<i>c</i>	Holds the matrix <i>C</i> of size (<i>m</i> , <i>n</i>).
<i>d</i>	Holds the matrix <i>D</i> of size (<i>m</i> , <i>m</i>).
<i>e</i>	Holds the matrix <i>E</i> of size (<i>n</i> , <i>n</i>).
<i>f</i>	Holds the matrix <i>F</i> of size (<i>m</i> , <i>n</i>).
<i>ijob</i>	Must be 0, 1, 2, 3, or 4. The default value is 0.
<i>trans</i>	Must be 'N' or 'T'. The default value is 'N'.

Application Notes

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set *lwork* = -1.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If *lwork* = -1, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?tgsna

Estimates reciprocal condition numbers for specified eigenvalues and/or eigenvectors of a pair of matrices in generalized real Schur canonical form.

Syntax

```
call stgsna(job, howmny, select, n, a, lda, b, ldb, vl, ldvl, vr, ldvr, s, dif, mm,
m, work, lwork, iwork, info)

call dtgsna(job, howmny, select, n, a, lda, b, ldb, vl, ldvl, vr, ldvr, s, dif, mm,
m, work, lwork, iwork, info)

call ctgsna(job, howmny, select, n, a, lda, b, ldb, vl, ldvl, vr, ldvr, s, dif, mm,
m, work, lwork, iwork, info)

call ztgsna(job, howmny, select, n, a, lda, b, ldb, vl, ldvl, vr, ldvr, s, dif, mm,
m, work, lwork, iwork, info)

call tgsna(a, b [,s] [,dif] [,vl] [,vr] [,select] [,m] [,info])
```

Include Files

Description

The real flavors *stgsna/dtgsna* of this routine estimate reciprocal condition numbers for specified eigenvalues and/or eigenvectors of a matrix pair (A, B) in generalized real Schur canonical form (or of any matrix pair $(Q^*A^*Z^T, Q^*B^*Z^T)$ with orthogonal matrices Q and Z).

(A, B) must be in generalized real Schur form (as returned by [gges/gges](#)), that is, A is block upper triangular with 1-by-1 and 2-by-2 diagonal blocks. B is upper triangular.

The complex flavors *ctgsna/ztgsna* estimate reciprocal condition numbers for specified eigenvalues and/or eigenvectors of a matrix pair (A, B) . (A, B) must be in generalized Schur canonical form, that is, A and B are both upper triangular.

Input Parameters

<i>job</i>	CHARACTER*1. Specifies whether condition numbers are required for eigenvalues or eigenvectors. Must be 'E' or 'V' or 'B'. If <i>job</i> = 'E', for eigenvalues only (compute <i>s</i>). If <i>job</i> = 'V', for eigenvectors only (compute <i>dif</i>). If <i>job</i> = 'B', for both eigenvalues and eigenvectors (compute both <i>s</i> and <i>dif</i>).
<i>howmny</i>	CHARACTER*1. Must be 'A' or 'S'.

	<p>If <i>howmny</i> = 'A', compute condition numbers for all eigenpairs.</p> <p>If <i>howmny</i> = 'S', compute condition numbers for selected eigenpairs specified by the logical array <i>select</i>.</p>
<i>select</i>	<p>LOGICAL.</p> <p>Array, size at least $\max(1, n)$.</p> <p>If <i>howmny</i> = 'S', <i>select</i> specifies the eigenpairs for which condition numbers are required.</p> <p>If <i>howmny</i> = 'A', <i>select</i> is not referenced.</p> <p><i>For real flavors:</i></p> <p>To select condition numbers for the eigenpair corresponding to a real eigenvalue ω_j, <i>select</i>(<i>j</i>) must be set to <code>.TRUE.</code>; to select condition numbers corresponding to a complex conjugate pair of eigenvalues ω_j and $\omega_j + 1$, either <i>select</i>(<i>j</i>) or <i>select</i>(<i>j</i> + 1) must be set to <code>.TRUE.</code></p> <p><i>For complex flavors:</i></p> <p>To select condition numbers for the corresponding <i>j</i>-th eigenvalue and/or eigenvector, <i>select</i>(<i>j</i>) must be set to <code>.TRUE.</code>.</p>
<i>n</i>	<p>INTEGER. The order of the square matrix pair (<i>A</i>, <i>B</i>)</p> <p>($n \geq 0$).</p>
<i>a</i> , <i>b</i> , <i>vl</i> , <i>vr</i> , <i>work</i>	<p>REAL for <i>stgsna</i></p> <p>DOUBLE PRECISION for <i>dtgsna</i></p> <p>COMPLEX for <i>ctgsna</i></p> <p>DOUBLE COMPLEX for <i>ztgsna</i>.</p> <p>Arrays:</p> <p><i>a</i>(<i>lda</i>,*) contains the upper quasi-triangular (for real flavors) or upper triangular (for complex flavors) matrix <i>A</i> in the pair (<i>A</i>, <i>B</i>).</p> <p>The second dimension of <i>a</i> must be at least $\max(1, n)$.</p> <p><i>b</i>(<i>ldb</i>,*) contains the upper triangular matrix <i>B</i> in the pair (<i>A</i>, <i>B</i>). The second dimension of <i>b</i> must be at least $\max(1, n)$.</p> <p>If <i>job</i> = 'E' or 'B', <i>vl</i>(<i>ldvl</i>,*) must contain left eigenvectors of (<i>A</i>, <i>B</i>), corresponding to the eigenpairs specified by <i>howmny</i> and <i>select</i>. The eigenvectors must be stored in consecutive columns of <i>vl</i>, as returned by ?tgevc.</p> <p>If <i>job</i> = 'V', <i>vl</i> is not referenced. The second dimension of <i>vl</i> must be at least $\max(1, m)$.</p> <p>If <i>job</i> = 'E' or 'B', <i>vr</i>(<i>ldvr</i>,*) must contain right eigenvectors of (<i>A</i>, <i>B</i>), corresponding to the eigenpairs specified by <i>howmny</i> and <i>select</i>. The eigenvectors must be stored in consecutive columns of <i>vr</i>, as returned by ?tgevc.</p> <p>If <i>job</i> = 'V', <i>vr</i> is not referenced. The second dimension of <i>vr</i> must be at least $\max(1, m)$.</p> <p><i>work</i> is a workspace array, its dimension $\max(1, lwork)$.</p>

	If $job = 'E'$, $work$ is not referenced.
lda	INTEGER. The leading dimension of a ; at least $\max(1, n)$.
ldb	INTEGER. The leading dimension of b ; at least $\max(1, n)$.
$ldvl$	INTEGER. The leading dimension of vl ; $ldvl \geq 1$. If $job = 'E'$ or $'B'$, then $ldvl \geq \max(1, n)$.
$ldvr$	INTEGER. The leading dimension of vr ; $ldvr \geq 1$. If $job = 'E'$ or $'B'$, then $ldvr \geq \max(1, n)$.
mm	INTEGER. The number of elements in the arrays s and dif ($mm \geq m$).
$lwork$	INTEGER. The dimension of the array $work$. $lwork \geq \max(1, n)$. If $job = 'V'$ or $'B'$, $lwork \geq 2*n*(n+2)+16$ for real flavors, and $lwork \geq \max(1, 2*n*n)$ for complex flavors. If $lwork = -1$, then a workspace query is assumed; the routine only calculates the optimal size of the $work$ array, returns this value as the first entry of the $work$ array, and no error message related to $lwork$ is issued by xerbla . See <i>Application Notes</i> for details.
$iwork$	INTEGER. Workspace array, size at least $(n+6)$ for real flavors, and at least $(n+2)$ for complex flavors. If $job = 'E'$, $iwork$ is not referenced.

Output Parameters

s	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors. Array, size (mm). If $job = 'E'$ or $'B'$, contains the reciprocal condition numbers of the selected eigenvalues, stored in consecutive elements of the array. If $job = 'V'$, s is not referenced. <i>For real flavors:</i> For a complex conjugate pair of eigenvalues two consecutive elements of s are set to the same value. Thus, $s(j)$, $dif(j)$, and the j -th columns of vl and vr all correspond to the same eigenpair (but not in general the j -th eigenpair, unless all eigenpairs are selected).
dif	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors. Array, size (mm). If $job = 'V'$ or $'B'$, contains the estimated reciprocal condition numbers of the selected eigenvectors, stored in consecutive elements of the array.

If the eigenvalues cannot be reordered to compute $dif(j)$, $dif(j)$ is set to 0; this can only occur when the true value would be very small anyway.

If $job = 'E'$, dif is not referenced.

For real flavors:

For a complex eigenvector, two consecutive elements of dif are set to the same value.

For complex flavors:

For each eigenvalue/vector specified by $select$, dif stores a Frobenius norm-based estimate of $Difl$.

m INTEGER. The number of elements in the arrays s and dif used to store the specified condition numbers; for each selected eigenvalue one element is used.

If $howmny = 'A'$, m is set to n .

work(1) *work(1)*
If job is not 'E' and $info = 0$, on exit, $work(1)$ contains the minimum value of $lwork$ required for optimum performance. Use this $lwork$ for subsequent runs.

info INTEGER.
If $info = 0$, the execution is successful.
If $info = -i$, the i -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine `tgssna` interface are the following:

<i>a</i>	Holds the matrix A of size (n,n) .
<i>b</i>	Holds the matrix B of size (n,n) .
<i>s</i>	Holds the vector of length (mm) .
<i>dif</i>	Holds the vector of length (mm) .
<i>vl</i>	Holds the matrix VL of size (n,mm) .
<i>vr</i>	Holds the matrix VR of size (n,mm) .
<i>select</i>	Holds the vector of length n .
<i>howmny</i>	Restored based on the presence of the argument <i>select</i> as follows: <i>howmny</i> = 'S', if <i>select</i> is present, <i>howmny</i> = 'A', if <i>select</i> is omitted.

job Restored based on the presence of arguments *s* and *dif* as follows: *job* = 'B', if both *s* and *dif* are present, *job* = 'E', if *s* is present and *dif* omitted, *job* = 'V', if *s* is omitted and *dif* present, Note that there will be an error condition if both *s* and *dif* are omitted.

Application Notes

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set *lwork* = -1.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If *lwork* = -1, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

Generalized Singular Value Decomposition

This section describes LAPACK computational routines used for finding the generalized singular value decomposition (GSVD) of two matrices *A* and *B* as

$$U^H A Q = D_1 * (0 \ R),$$

$$V^H B Q = D_2 * (0 \ R),$$

where *U*, *V*, and *Q* are orthogonal/unitary matrices, *R* is a nonsingular upper triangular matrix, and *D*₁, *D*₂ are "diagonal" matrices of the structure detailed in the routines description section.

Table "Computational Routines for Generalized Singular Value Decomposition" lists LAPACK routines (FORTRAN 77 interface) that perform generalized singular value decomposition of matrices. The corresponding routine names in the Fortran 95 interface are without the first symbol.

Computational Routines for Generalized Singular Value Decomposition

Routine name	Operation performed
ggsvp	Computes the preprocessing decomposition for the generalized SVD
tgsja	Computes the generalized SVD of two upper triangular or trapezoidal matrices

You can use routines listed in the above table as well as the driver routine [ggsvd](#) to find the GSVD of a pair of general rectangular matrices.

?ggsvp

Computes the preprocessing decomposition for the generalized SVD.

Syntax

```
call sggsvp(jobu, jobv, jobq, m, p, n, a, lda, b, ldb, tola, tol, k, l, u, ldu, v,
ldv, q, ldq, iwork, tau, work, info)
```

```
call dggsvp(jobu, jobv, jobq, m, p, n, a, lda, b, ldb, tola, tol, k, l, u, ldu, v,
ldv, q, ldq, iwork, tau, work, info)
```

```
call cggsvp(jobu, jobv, jobq, m, p, n, a, lda, b, ldb, tola, tol, k, l, u, ldu, v,
ldv, q, ldq, iwork, rwork, tau, work, info)
```

```
call zggsvp(jobu, jobv, jobq, m, p, n, a, lda, b, ldb, tola, tolb, k, l, u, ldu, v,
ldv, q, ldq, iwork, rwork, tau, work, info)
```

```
call ggsvp(a, b, tola, tolb [, k] [,l] [,u] [,v] [,q] [,info])
```

Include Files

- `mkl.fi`, `lapack.f90`

Description

The routine computes orthogonal matrices U , V and Q such that

1. *Journal of the American Medical Association*, 2000; 284: 2689-2695.

$$= \begin{matrix} n-k-l & k & l \\ k & \begin{pmatrix} 0 & A_{12} & A_{13} \\ 0 & 0 & A_{23} \end{pmatrix} \end{matrix}, \quad \text{if } m-k-l < 0$$

• **What is the purpose of the study?** The purpose of the study is to determine the effect of a 12-week resistance training program on the strength and endurance of the lower extremities in healthy young adults.

where the k -by- k matrix A_{12} and l -by- l matrix B_{13} are nonsingular upper triangular; A_{23} is l -by- l upper triangular if $m-k-l \geq 0$, otherwise A_{23} is $(m-k)$ -by- l upper trapezoidal. The sum $k+l$ is equal to the effective numerical rank of the $(m+p)$ -by- n matrix $(A^H, B^H)^H$.

This decomposition is the preprocessing step for computing the Generalized Singular Value Decomposition (GSVD), see subroutine [?tgsja](#).

Input Parameters

jobu CHARACTER*1. Must be 'U' or 'N'.
If *jobu* = 'U', orthogonal/unitary matrix *U* is computed.
If *jobu* = 'N', *U* is not computed.

jobv CHARACTER*1. Must be 'V' or 'N'.
If *jobv* = 'V', orthogonal/unitary matrix *V* is computed.

	If $jobv = 'N'$, V is not computed.
$jobq$	CHARACTER*1. Must be 'Q' or 'N'. If $jobq = 'Q'$, orthogonal/unitary matrix Q is computed. If $jobq = 'N'$, Q is not computed.
m	INTEGER. The number of rows of the matrix A ($m \geq 0$).
p	INTEGER. The number of rows of the matrix B ($p \geq 0$).
n	INTEGER. The number of columns of the matrices A and B ($n \geq 0$).
$a, b, tau, work$	REAL for sggsvp DOUBLE PRECISION for dggsvp COMPLEX for cggsvp DOUBLE COMPLEX for zggsvp. Arrays: $a(lda,*)$ contains the m -by- n matrix A . The second dimension of a must be at least $\max(1, n)$. $b(ldb,*)$ contains the p -by- n matrix B . The second dimension of b must be at least $\max(1, n)$. $tau(*)$ is a workspace array. The dimension of tau must be at least $\max(1, n)$. $work(*)$ is a workspace array. The dimension of $work$ must be at least $\max(1, 3n, m, p)$.
lda	INTEGER. The leading dimension of a ; at least $\max(1, m)$.
ldb	INTEGER. The leading dimension of b ; at least $\max(1, p)$.
$tola, tol b$	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors. $tola$ and $tol b$ are the thresholds to determine the effective numerical rank of matrix B and a subblock of A . Generally, they are set to $tola = \max(m, n) * A * \text{MACHEPS},$ $tol b = \max(p, n) * B * \text{MACHEPS}.$ The size of $tola$ and $tol b$ may affect the size of backward errors of the decomposition.
ldu	INTEGER. The leading dimension of the output array u . $ldu \geq \max(1, m)$ if $jobu = 'U'$; $ldu \geq 1$ otherwise.
ldv	INTEGER. The leading dimension of the output array v . $ldv \geq \max(1, p)$ if $jobv = 'V'$; $ldv \geq 1$ otherwise.

<i>ldq</i>	INTEGER. The leading dimension of the output array <i>q</i> . $ldq \geq \max(1, n)$ if <i>jobq</i> = 'Q'; $ldq \geq 1$ otherwise.
<i>iwork</i>	INTEGER. Workspace array, size at least $\max(1, n)$.
<i>rwork</i>	REAL for cggsvp DOUBLE PRECISION for zggsvp. Workspace array, size at least $\max(1, 2n)$. Used in complex flavors only.

Output Parameters

<i>a</i>	Overwritten by the triangular (or trapezoidal) matrix described in the <i>Description</i> section.
<i>b</i>	Overwritten by the triangular matrix described in the <i>Description</i> section.
<i>k, l</i>	INTEGER. On exit, <i>k</i> and <i>l</i> specify the dimension of subblocks. The sum $k + l$ is equal to effective numerical rank of $(A^H, B^H)^H$.
<i>u, v, q</i>	REAL for sggsvp DOUBLE PRECISION for dggsvp COMPLEX for cggsvp DOUBLE COMPLEX for zggsvp. Arrays: If <i>jobu</i> = 'U', <i>u</i> (<i>ldu</i> ,*) contains the orthogonal/unitary matrix <i>U</i> . The second dimension of <i>u</i> must be at least $\max(1, m)$. If <i>jobu</i> = 'N', <i>u</i> is not referenced. If <i>jobv</i> = 'V', <i>v</i> (<i>ldv</i> ,*) contains the orthogonal/unitary matrix <i>V</i> . The second dimension of <i>v</i> must be at least $\max(1, m)$. If <i>jobv</i> = 'N', <i>v</i> is not referenced. If <i>jobq</i> = 'Q', <i>q</i> (<i>ldq</i> ,*) contains the orthogonal/unitary matrix <i>Q</i> . The second dimension of <i>q</i> must be at least $\max(1, n)$. If <i>jobq</i> = 'N', <i>q</i> is not referenced.
<i>info</i>	INTEGER. If <i>info</i> = 0, the execution is successful. If <i>info</i> = - <i>i</i> , the <i>i</i> -th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see [LAPACK 95 Interface Conventions](#).

Specific details for the routine *ggsvp* interface are the following:

<i>a</i>	Holds the matrix <i>A</i> of size (<i>m</i> , <i>n</i>).
----------	--

<i>b</i>	Holds the matrix <i>B</i> of size (p,n) .
<i>u</i>	Holds the matrix <i>U</i> of size (m,m) .
<i>v</i>	Holds the matrix <i>V</i> of size (p,m) .
<i>q</i>	Holds the matrix <i>Q</i> of size (n,n) .
<i>jobu</i>	Restored based on the presence of the argument <i>u</i> as follows: <i>jobu</i> = 'U', if <i>u</i> is present, <i>jobu</i> = 'N', if <i>u</i> is omitted.
<i>jobv</i>	Restored based on the presence of the argument <i>v</i> as follows: <i>jobz</i> = 'V', if <i>v</i> is present, <i>jobz</i> = 'N', if <i>v</i> is omitted.
<i>jobq</i>	Restored based on the presence of the argument <i>q</i> as follows: <i>jobz</i> = 'Q', if <i>q</i> is present, <i>jobz</i> = 'N', if <i>q</i> is omitted.

?tgsja

Computes the generalized SVD of two upper triangular or trapezoidal matrices.

Syntax

```
call stgsja(jobu, jobv, jobq, m, p, n, k, l, a, lda, b, ldb, tola, tol, alpha, beta,
u, ldu, v, ldv, q, ldq, work, ncycle, info)
call dtgsja(jobu, jobv, jobq, m, p, n, k, l, a, lda, b, ldb, tola, tol, alpha, beta,
