

An example of collecting Wireless ETW log

ETW (Event Tracing for Windowing)

1. Create a folder 'tmp' under c:\ and enter the following at an elevated command prompt:

```
netsh trace start wireless_dbg capture=yes overwrite=yes maxsize=4096 tracefile=c:\tmp\wireless.etl
```

2. Reproduce the issue

3. Stop the trace by entering the command:

```
netsh trace stop
```

4. Two files wireless.cab and wireless.etl are automatically generated. Just collect the **wireless.cab** file (the etl is already included in the .cab file)
